journey—approximately 33 hours and some odd mi
if memory serves me right. However, they were
gruelling hours, punishing hours, unforgiving hour
demanded their pound of flesh upon every circle
clock. Just anybody couldn't stand a trip like tha
course, we speak of Lindbergh's pluck, and we are
of this nation of ours, a nation that can produce
of pluck and daring such as Lindbergh, but we
not forget that pluck can't be reckoned without c
ering something else — good health. Not just
health, you know, but DAIRY HEALTH. Som
there is a difference, you know.

We'll take, for example, this chap, Lindbergh
was young—possibly twenty-five. Possibly not s
Others say, only twenty-two. It is barely possibl
he told a lie about his age—one of those sweet
white lies so peculiar to youth in matters involvin

At any rate, say twenty-five. That is young-
perately young—a time when the muscles have h
set, when the mind of the boy has hardly taken any
nite turn.

He set forth alone, not wanting any company, a
no one to share these terrors with him—and they
terrors. Of that make no mistake. Picture, if you
a plane high in the heavens, with darkness all aroun
a growling, grumbling, uncomfortable sea underr
and only God overhead.

That was the predicament of Lindbergh, traveli
his plane, accompanied only by a trustworthy baro
and a trustworthy God.

Yet there was one more force in the plane—
health. This rugged boy of the middle West, br
up from infancy on milk, knew when he had finish
gruelling ride that one thing, and one thing only,
restore to him the energy that the cruel hours had
from his system—milk!

It was not exactly Lindbergh speaking when thi
asked for a drink of milk; it was the inner self, the
unseen, never-sleeping spirit that dwells within all
and sometimes speaks for us.

But, we'll get back to the test. Many peopl
going to capitalize upon this Lindbergh exploit.
know that. You have read about how this and
maker of this and that airplane device has advertis

orld that his product was used in the aeroplane ook Lindbergh safely across the Atlantic.

ill the milk dealers advertise this product in con- n with this expediton? I don't think so—frankly, 't.

e milk people are not in the habit of seizing upon timely opportunties. So it is that for many months ead that Guzzem's oil was used in this flight, and mith's motors were the power that carried him to y, and that such and such a company furnished lts, and another the nuts, and still another the bat- —but the real power behind the expedition—milk— ever be exploited?

ho answers—"No."

ay? Because the milk dealers are not organized erchandising, never have given proper appreciation great scheme of selling goods.

is the greatest opportunity since the product of iry cow ever assumed commercial proportions, but for a limited few here and there, nothing will be about it.

ndbergh is a hero. That is generally agreed. All aris girls wanted to kiss him. Some of the Paris lid kiss him, much to his chagrin.

t Lindbergh, frank youth, will admit that the real n the whole transaction is good old Moo Cow, the mother of mankind, the benevolent creature that up for him the rugged dairy health that enabled have the "guts" to stick to his job when it looked verything was against him—to pray for success it seemed that even the God in high heaven was stening—to call upon that last, responding bit of when it seemed there was no more to call upon. at's dairy health, but, up to finishing this article, n't yet heard of a milk dealer that ever sold his on this basis.

e story of Lindbergh has been told many times.

w, who will tell the story of dairy health? Who?

ccess lies in doing little things well. "Milk ." Want Ads are little things but they carry big ges. Read them regularly.

"WILL DAIRYING BE OVERDONE?" "NO!"

The question, "Will dairying be overdone?" has been answered by K. L. Hatch, assistant director of the agricultural extension service at the University of Wisconsin, Madison, Wis., as follows: "No, not if there is both an increase in quality of products and a greater use of by-products."

Prof. Hatch believes that inefficiency is overdone and poor quality products are flooding the market, and he also believes that orderly marketing, quality products and economical production can not be overdone.

The Wisconsin extension worker is convinced that the influence of the dairy industry is felt throughout our entire economic structure. He sees a score more of industries depending on dairying to use all or a part of their products, and realizes that its collapse would be nothing short of a national calamity.

"Dairy products furnish one-sixth of the total food of the nation," Hatch recently declared. These are becoming increasingly important as science discovers new facts about its food value.

More and more consumers are demanding quality products and Hatch believes that the dairy farmer and factory operator who cater to this demand will be amply repaid. He reports that many factories have increased the returns to their patrons 10 to 35 per cent by raising the quality of their product. "Yet, there is not enough of the high class products to meet the demand."

OHIO ASSOCIATION ANNOUNCES CONVENTION DATES.

The annual convention of the Ohio Dairy Products Association will be held in Toledo on January 24 and 25, 1928, according to recent announcement by W. A. Wentworth, 5 East Long St., Columbus, secretary of the association. Commodore Perry Hotel will be convention headquarters.

The Ohio Dairy Products Assn. is a combination of three distinct organizations, consisting of Ohio Milk Distributors' Assn., Ohio Association of Creamery Owners and Managers, and the Ohio Association of Ice Cream Manufacturers.

The Ohioans have established a reputation for holding well attended conventions with speakers of ability on their programs and it is expected that the 1928 convention will be no exception.

A. H. VERRINDER PASSES.

After a brief illness A. H. Verrinder, advertising manager, The Paterson Parchment Paper Co. of Passaic, New Jersey, died on Tuesday, June 9. Pleurisy and pneumonia followed an attack of the grippe.

Mr. Verrinder was a competent business man and possessed a pleasing personality. He leaves a host of friends to mourn his sudden and untimely death.

GARBED IN MILK.

Note the good looking young lady on our cover page. Every article of clothing the lady wears was made from milk. In short, the artificial silk, buttons, artificial leather and jewelry were made from casein, derived from skim milk.—Acme Photo.

To EUROPE in 1928

DETAILS for World' Dairy Congress Tou Next Year Taking Shape Leviathan --- the World' Best Passenger Liner --- Se lected for the Trip. *ALL ABOARD! -- LET'S GO!*

WE HAVE been anxiously waiting for the time when we could announce definite arrangements for the World's Dairy Congress Tour to Europe next year.

That time has arrived. The S. S. Leviathan, the largest and most luxurious steamship afloat, has been selected for the trip and we are now ready to accept reservations.

The World's Dairy Congress will be held in Great Britain during the latter part of June and the early part of July of next year. Dairymen from all over the world will gather there, and sessions will be held in London, Reading, Edinburgh and Belfast.

The benefits to be derived from such a convention are infinite. Which one of us has not at some time or other longed to discuss the problems which puzzled him, and to hear the other fellow's way of solving it? Who has not longed for a forum in which marketing and advertising plans could be threshed out? All this, and more, the World's Dairy Congress has to offer. You will return home with a gold mine of information, gleaned from all those other men, who, though hailing from all parts of the world, are in the same business as you. You will return home with new schemes, ways and means, and with fresh zest and enthusiasm to make things hum!

But the word "convention" sounds too business-like, for this is not going to be "strictly business." We are planning to combine the congress with a glorious vacation abroad for you, your family and friends. For you have crossed the Atlantic and are in Europe, NOT SEE EUROPE?

Our gala holiday begins on June 9, 1928, wh New York, we board the palatial steamer, the Levia Then follow lazy, dreamy days at sea on our luxu floating palace, and then—Europe! Perhaps you always longed to visit Paris—sophisticated playg of the Continent—now is your chance. But no where you wish to wander, pre-convention and convention tours have been expertly arranged b world-famous travel organization, the American Ex Company, whom we are glad to announce we hav pointed as official transportation agents for this ment. That company is ideally equipped to mak stay abroad one continuous round of pleasure, by t care of those bothersome details, such as reserva trains, etc., which so often take the joy out of trav

On June 9, 1928, the great trans-Atlantic liner, Leviathan, will leave New York for Cherbourg car a happy throng of buttermakers, cheesemakers cream manufacturers, milk plant men, equipment supply manufacturers, families, wives and friends bound for the World's Dairy Congress in London greatest international convention in the history of c ing.

Most all of us have planned to go to Europe time—sometime "when we could afford it," or, " we had the time." But now comes this wonderfu

S. S. Leviathan, the World's Finest Steamship.

ity to take a trip abroad—not alone—but in com- with dozens and dozens of people we know, and undreds of others who will be our friends before yage is over.

one taking this trip can come back without feel- e great, broadening influence of contact with peo- the same industry in other countries. Almost civilized nation on earth will be represented in nvention for the betterment and progress of the industries.

one sense, this World's Dairy Congress Tour is a ss trip for it is being held for the benefit of you our business and the benefit of every dairy prod- anufacturer in the world. It will be good busi- or you to attend this congress because you will back with you information and new ideas of in- able value to you in your business. The new s you make, the new things you learn—all these ore than repay you for going.

t the World's Dairy Congress Tour is also a pleas- ip, for you can bring your wife and family and s along with you. From the moment you leave York, your hours will be filled with pleasant scenes, ations and pastimes.

ery detail of comfort and convenience has been ar- d in advance for you. The S. S. Leviathan is the t and most luxurious ocean liner in the world. It eritable floating palace of elegance and beauty. ng that will contribute to your pleasure has been oked.

ring the passage over, there will be business meet- and entertainment programs. There will be in- l meetings for each division of the dairy indus- each day of the trip across. After business, those wish can participate in games of deck tennis, quoits. bars, deck golf, swimming contests, and other .

r the ladies there will be bridge games with suit- rizes, afternoon teas; and in the evening, concerts ancing in the ballroom.

om the day that you leave New York until you back again, every hour of your time will be packed leasure. Every detail of travel, hotel, reservation, rips, routes, and money exchange, etc., will be easy for you by a travel expert who will be at service throughout the trip.

before mentioned, the S. S. Leviathan will sail New York on June 9, 1928, arriving at Cherbourg, e, on June 15, where a representative of the Amer- Express Company will meet the delegates and con- hem to Paris, to the battle fields, to Belgium, Hol- and across the channel to London in time for the l's Dairy Congress which opens in London on 26.

is permits ten days for touring between landing erbourg and the opening of the congress. Rates is tour, including everything, will be given on ap- ion.

legates who do not desire to take this tour can go Cherbourg to London or take in any side trip that may wish. Special tours of all kinds can be ar- d.

e rates from New York to Cherbourg are as fol- First class (one way) $290.00 and up; second class way) $152.50 and up; tourist (third cabin, round $190.00.

u can stay in Europe as long as you wish, or as as your passport will permit, and if you buy a round trip ticket you can use any of the following ships for your return sailing:

Leviathan from Southampton—July 10.
America from Bremen—July 17.
America from Cherbourg, Southampton—July 18.
Republic from Bremen—July 23.
Republic from Cherbourg, Southampton—July 24.
Pres. Roosevelt from Bremen—July 25.
Pres. Roosevelt from Cherbourg, Southampton—July 26.
George Washington from Bremen—Aug. 1.
George Washington from Cherbourg, Southampton—Aug. 2.
Leviathan from Southampton—July 31.
Pres. Harding from Bremen—Aug. 8.
Pres. Harding from Cherbourg, Southampton—Aug. 9.
Later sailing dates furnished on request.

We are now prepared to give additional information that each delegate may want concerning any side trips that he or she may want to take.

We are also prepared to accept definite reservations and allot accommodations. First come, first served.

Come on, friends, let's make this the greatest dairy event in world history. Let's show the world the "place in the sun" that our industry occupies.

And, don't forget, while we are doing it we will also have a good time.

Write us and tell us your plans. Let us help you figure them out so as to make this trip the most enjoyable one in your lifetime. Address Tour Department, The Olsen Publishing Co., Milwaukee, Wis.

NINTH ANNUAL BROOK HILL DEALERS' PICNIC.

The entertainment committee has met several times behind locked doors and surrounded with the utmost secrecy. Rumors concerning the plans for the big day are circulating freely but no definite word would be given out by any member. Pete Christiansen only volunteered this information: "It's going to be bigger, better and funnier than ever. We expect even a larger crowd than last year."

We have heard, indirectly, that the annual ceremony attendant upon the coronation of the new Lord High Chief Keeper of the Brook Hill Bull will be amplified and the ritual made far more impressive. The Chicago legal lights, who have in past years ruled the meeting so ably, will again hold sway.

The big day is Thursday, July 21st.

A bigger and speedier special train will be run from Chicago to Milwaukee, and thence to the farm. Thus milk dealers coming from central Illinois, and other points south, east and west of Chicago, can come to the Windy City the previous evening and hop on the special train the next morning.

DEFINITION OF CULTURED BUTTERMILK.

The Foods Standards Committee has adopted a definition of cultured buttermilk to be used by officials in enforcing the federal food and drug act, as follows: "Cultured buttermilk is the product obtained by souring pasteurized skimmed or partially skimmed milk by means of a suitable culture of lactic bacteria. It contains not less than eight and five-tenths per cent (8.5 per cent) of milk solids-not-fat."

When To Scrap Delivery Trucks

Also Some Practical Suggestions on "Breaking in" a New Truck, Care of Tires, etc., of Interest to the Milk Plant Manager

THERE is a defininte time for trading in a motor truck. To trade it in before that time is extravagance. To keep it longer is false economy.

How can a milk dealer tell just when that time arrives?

In the first place let us just see what points must be considered when we are wondering whether we ought to scrap a truck. Then we will tell how some of the truck owners who have made a study of the thing are getting the "turn in" problem on a practical scientific basis.

These are the seven keys to the solution:

1. Cost figure charts always show that unit running costs go steadily down until the car reaches a certain age and then begin to climb again.
2. Breakdowns, involving delays and irregular schedules, become sufficiently frequent after a certain point so that the lack of dependability more than balances the investment saving if a new truck is not bought.
3. Accident risks increase as the truck becomes older. The crystallization of aged parts, including such units as steering parts, spindles, wheels, brakes, etc., is the cause of many expensive accidents.
4. The advertising and good will value of a new truck as against an old one is worth something in considering the advisability of the investment.
5. The driver's pride in his vehicle and his interest in his work is likewise worth considering. No one can expect a driver to take pride in an aged, run-down vehicle and a firm cannot attract good drivers to its employ when it asks them to work with antiquated machines.
6. On the other hand the differences in price between the trade-in value of the old truck and the price of a new one must be justified by the elimination of enough undesirable features which would exist if the old truck were kept in service. In other words, it is not enough to say that because a truck is beginning to show wear it should be replaced. A computation of costs is necessary to show that the new purchase is really the most economical thing to do.
7. A new truck, of course, requires breaking-in, as will be pointed out later in this article. This means that a change in usage will be needed so that the new truck will be favored with a reliable driver and less strenuous service for the first thousand miles.

How Age Affects Costs.

In measuring the difference between buying a new truck and using the old one, three factors influence and vary the cost. These are:

1. Age of car—A car will become more expensive as it grows older in use. Replacements are necessary on parts which become worn through age. Age will also affect price of replacements because of changing models.
2. Miles driven—There is a definite increase in maintenance expenditure with an increase in miles run. At certain mileages, overhauls are necessary.
3. Territory covered—City cars cannot be compared with country cars without some adjustments for differences in road conditions and traffic.

All costs considered, the majority of concerns who have made careful studies find that the time for trading in is between three and five years. A survey about two years ago by a truck association show average of four years three months.

However, averages and general recommendation without value in deciding an individual case of kind. So much depends on the quality and size o vehicle, the kind of service it must perform and th ture of the roads and traffic conditions in the terr it serves.

Some definite means of measuring actual cos necessary to reach the answer. Some concerns done this. Systems have been worked out for fixin time when maintenance costs stop going down and l to climb up.

How These Systems Work.

The most satisfactory method is to chart the formance of each truck in service. The figures o chart are easily obtainable from the yearly cost mary. Then we will be able to detect the time trading-in and know what we can expect from ce types of vehicles and from certain specified truc quirements.

Accompanying this article are three charts w show the way in which one concern has figured the for trading-in. These are reproduced because they trate better than any amount of description, the pr way to go about it. In this case the computation been made on a basis of light four-cylinder cars. same principle exactly can be applied to any siz truck. Your own figures inserted where these are will give you a bird's eye picture of your costs an able you to tell when it is wise to scrap a car.

Figure 1 is a summary intended to show what pens to the depreciation and maintenance costs if a t is traded in every year, every two years, every t years or every four years. It has been based on concern's experience with trucks used both on routes and country routes and shows also the figures different monthly mileages.

It will be noticed on this chart that costs go d until the truck is three years old and then begi climb again.

In figure 2 a tabulation is given of certain it among the maintenance figures, showing how rap the costs of overhauling and replacements increas the truck rolls up a greater mileage. The figures this chart do not, of course, represent total mainten expense. They include only the charges that are to wearing out of parts and repairs caused by the of the vehicle. This chart is also of help in determi the time to trade in a car.

Figure 3 is similar to figure 2, except that it co the regular maintenance or running expenses. It ena the owner to tell the cost of regular maintenance volved in a truck from one year to another during life. Here, too, it can be seen that there is a gra increase each year, not as noticeable as the items figure 2, yet costs which must be calculated in arri at a decision.

One concern with considerable experience in gaug the proper time to trade in has drawn the following dict from its own cost comparisons:

Two No. 90 New Series De Lavals at Deerfield Creamery, Deerfield, Wisconsin.

For Gold Medal Butter— a New Series De Laval

DE LAVAL Separators long ago proved their supremacy in producing the high quality cream from which prize winning butter must be made. At each annual convention of the National Creamery Buttermakers Association, with but a single exception, the highest prize, and practically all other prizes as well, has been awarded butter made from De Laval-separated cream.

New Series De Laval Separators had their first chance to score in this event in December, 1926. One of them, a No. 70 in the plant of Siegel Creamery Company, Waverly, Ia., produced the cream with which Mr. Will Behrens was able to make a score of 96, winning the Gold Medal in the fresh butter class.

Not every user of a De Laval Separator can win a Gold Medal. There aren't enough to go around. But it is becoming increasingly evident that unless he is equipped with a De Laval the would-be prize winner hasn't even the proverbial Chinaman's chance—the more so since the advent of the New Series machine.

Better write for full details of this and other *proved* features of the New Series De Laval.

SUGGESTIONS ON MANUFACTURE OF ACID
ILUS MILK AND HINTS ON TESTING MIL

Connecticut.

Dear Sir:—We are very anxious to get information on the manufacture of acidophilus milk and are writing you hoping you may be able to give us the desired information. We want to know the equipment needed, the method of manufacture and the best place to buy the culture.

We are handling buttermilk quite successfully now, but understand acidophilus milk is difficult to make.

Reply: It is somewhat difficult to make the product, first, because the bacteria are grown at 98 degrees F., at which temperature bacillus coli and many other undesirable germs will incubate most readily. Because of this fact complete sterilization of the milk must be practiced for the manufacture of the mother culture. This is best accomplished by using an autoclave which is a steam pressure sterilizer use in bacteriological work. Since these are rather expensive pieces of apparatus, I believe you can accomplish very efficient results by using a pressure cooker. You can secure one which will hold four quarts of skim milk. The milk can be sterilized by placing the bottles in the pressure cooker and developing a steam pressure of ten pounds, holding for 20 minutes. I believe this will give you a little better results than trying to hold at a higher pressure for a shorter period. Sterilizing the milk in this way will enable you to carry your cultures from day to day without much danger of contamination, providing you are very careful in handling the bottles so as not to contaminate the tops.

The original culture for inoculating into the sterilized milk at a temperature of 98 degrees F. can be obtained by writing to Dr. L. F. Rettger, Yale University. I believe the culture will cost you about $5.00.

The mother culture is carried on daily in sterilized milk in the same manner in which you carry the culture for ordinary buttermilk. In the manufacture of the bulk product it is likewise essential that near sterility of the milk be obtained. Heating to a temperature of 190 degrees for one hour does not sterilize. For this reason the bulk skim milk is usually heated to 190 degrees for one hour, cooled to 98 degrees F. and then held for about four hours. It is then re-heated to 190 degrees and held another hour, being then re-cooled to 98 degrees and inoculated with the acidophilus culture. I believe one-half per cent inoculation would be about sufficient although you may vary it to suit your conditions and to develop the amount of acid most desirable.

The reason for practicing intermittent sterilization of the bulk skim milk is that during the holding period of four hours many undesirable bacteria will have a chance to germinate and then will be killed by the second heating to 190 degrees.

The manufacture of acidophilus milk in a commercial way is in its infancy and from time to time suggestions and better methods will be devised. However, I believe the above will give you satisfactory results. I want to especially caution you on the importance of near sterility as possible in the milk used for culturing acidophilus organisms. We are making the product in small quantities and even with the best of care and bacteriological equipment, it requires very careful technique.

* * *

Pennsylvania.

Dear Sir:—I am a constant reader of your articles in The Milk Dealer. In your letter of January in reply
to one directed to you regarding the use of a vis
for pumping cream to which no pressure is im
that this might be the cause of the breaking asun
fat globules, I am curious to know why this woul
place when no pressure is subjected.

The ready determination of solids not fat in
of different consistency has always been a mat
doubt in my mind, in fact I know of no form
which it can be easily calculated. Therefore, wou
formula always apply of subtracting the per c
cream from 100 and multiply by the assumed skir
solids of 8.9 per cent? Will you explain in deta
this formula can be applied?

In the manufacture of cottage cheese by the
starter and rennet what is your opinion of addin
per cent inoculation of cultured buttermilk? T
done by some operators and I am curious to
whether they seek texture or flavor or rapid
ripening.

Reply: First, regarding the viscolizer for pu
cream. The question to which you refer had t
with failure to get overrun in buttermaking. The
many causes of this, such as the breed of cows,
of year, feed, temperatures of churning, too muc
too vigorous agitation of cream, etc. In the ca
ferred to the cream was pumped twice by a vis
without pressure. When no pressure is applie
factor of viscolization would, of course, be entirel
inated; however, the agitation of running the
through the machine from one vat to another woul
doubtedly, cause some of the fat globules to be b
up. This, of course, varying with the temperat
the cream, distance pumped, etc. Fat particles o
ous sizes would thus pack more readily in the ch
butter and leave less space for moisture. The vis
makes a good pump and this is no criticism o
machine. We were simply trying to eliminate on
number of factors that might have been a contri
cause of low overrun.

Now, as to the determination of solids-not-
cream. Scientifically, you are correct. Jerse
Guernsey milk containing on the average more
not-fat than Holstein or Ayrshire milk, would res
cream containing more solids-not-fat than cream
same richness from the latter breeds of cattle.
solids-not-fat would also vary according to indi
cows within the breed, etc. However, for practica
poses the figure 8.9 per cent is taken to represe
solids-not-fat in skim milk. This is purely an a
figure. The formula can be explained as follows:

First, think of milk as being composed of two
(1) fat which is the pure oil and (2) skim milk co
ing the materials other than fat, such as casein, al
sugar, ash and water. To carry the illustration f
we can think of cream as being simply rich mi
other words, it is made up of just a little more
addition to the same identical materials as are fo
skim milk but in lesser quantities. Now, assum
have 100 pounds of 40 per cent cream. This mean
we have 40 pounds of fat present in the 100, the
ing assumed to contain nothing but the pure oil.
tracting 40 from 100 leaves 60, which is the quant
skim milk present. Since 8.9 per cent of this repr

HE G-E SINGLE PHASE MOTOR

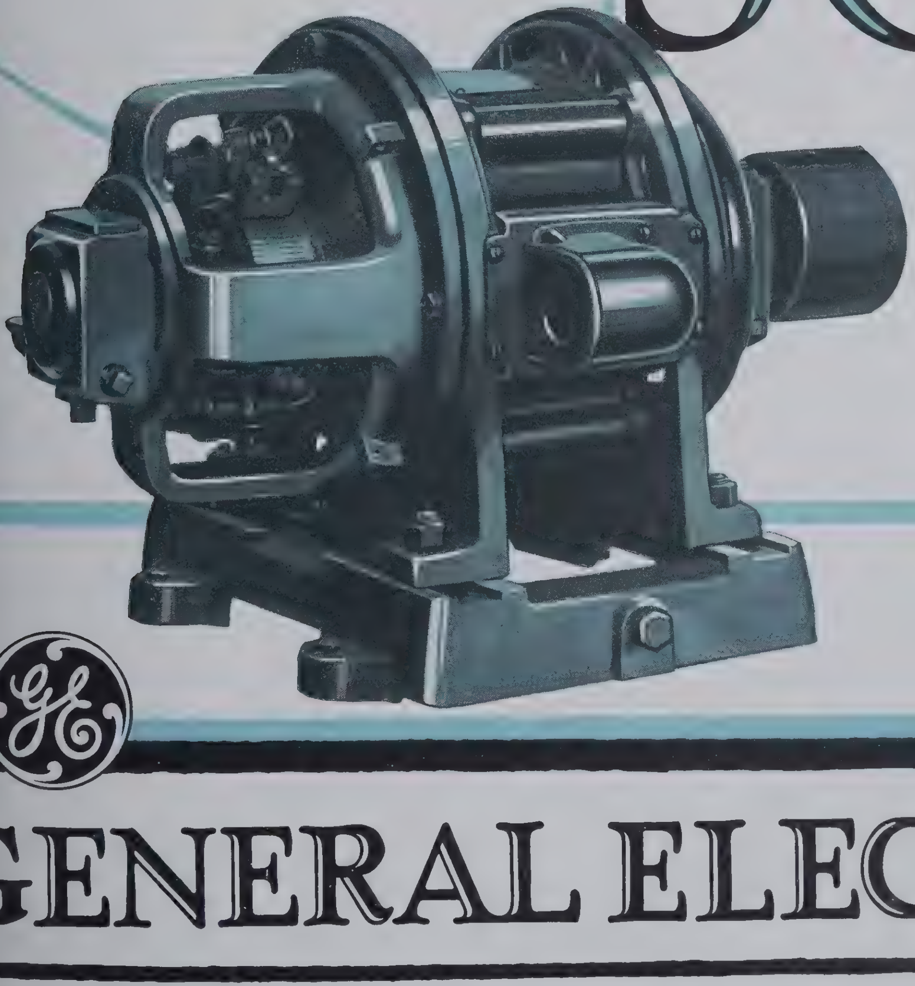
Simplicity
Positive Operation on Low Voltage
Unusual Torque Characteristics
High Power-Factor
Quiet Starting
Cool and Quiet Running
Strong Construction
Close Speed Regulation
High Efficiency
Generous Overload Capacity

make the "SCR" the outstanding single phase motor and assure that satisfaction which accompanies an investment in G-E products.

TYPE

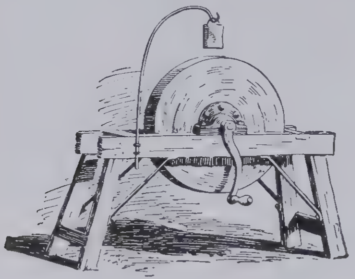
SCR

GENERAL ELECTRIC



Why

"SCR" is the outstanding single phase moto



Speaking of Simplicity!

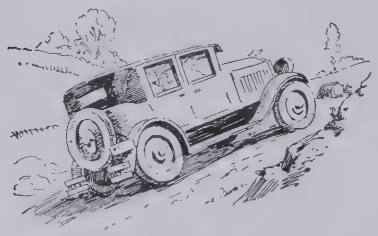
Simplicity—

No internal switches or centrifugal devices—no complicated moving parts.

The hurdle that balks many single phase motors!

Low Voltage—

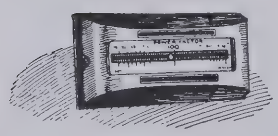
A 110-volt "SCR" will start, accelerate, and carry its load on 75 *volts.*



Good at uphill work!

Torque—

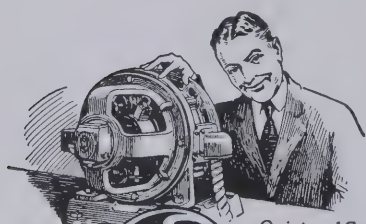
Starting torque 3 times full load torque. Accelerating torque and maximum running torque twice full load torque. Smooth and even acceleration—no dips in the torque curve.



The pointer hovers near 100!

Power-Factor—

High power-factor coupled with low starting current and *high efficiency* results in low operating cost.



Quiet and Cool!

Quiet and Cool—

Through liberal design, the "SCR" is quiet at start and at full load—and is cool running.

"SCR" Motors can be furnished equipped with ball bearings if desired.

Motorized Power
—fitted to every need

A Library of Milk Merchandising

"Knowledge Is Power," Says Jake Morris, "And Sales Knowledge Means Sales Power to the Milk Plant."

[*By Our Special Southern Correspondent*]

HIS man is reducing milk merchandising to a cience, a system of scientific research as it were. He has his own library, Jake Morris has, and his ippi milk plant, as a result, is one of the most ate of any medium-sized town in the South—as ssive, in fact, as any man's town in any section. may be over-emphasizing this library business,'' orris, ''but if so, it's because of the fact that my training came late in the night, and since getting 'book advantages' I have become so thoroughly this business of 'knowledge is power' that I am g it to the limit.''

e Morris, coming up like many men of his years, riod when Southern education was almost wholly d for a period, while the Southern people were g to right the chaos of war, discovered late in life ck of an education is a handicap.

hat time he was trying to make a living peddling rom a small farm with a half dozen cows. Those ut him through the university. It took twelve o complete the course, working as he did, going ol when he had the money and knocking off to nore when it played out.

Morris Dairy has a library. Not just a library, **ibrary**. It has the works of the old masters—and v. For there are new masters, you know, or maybe n't. Morris knows them. They are masters of w order of business logic, business science, the s of this new study of salescraft.

ny of the most worthwhile books of the present rcial age are to be found on his shelves, virtually he best books on merchandising. There are books t management, sanitation, sanitation control, ex- management, and what not.

thermore, there are books of Jake Morris' own , worlds of them. Good books. Valuable books. to study and ponder over in profitable hours. re his, but he didn't write them; he compiled

y are books containing clippings of all the worth- nilk advertisments that Morris' library force can The company subscribes to a large number of pers. Everything pertaining to milk and health . This is used in getting out printed literature irect to the home. Every magazine reaching the at deals with milk and health is filed. Sometimes of the articles are made, if it is of sufficient im- e, and employees are asked to read it.

ly newspapers have their clipping ''morgues'' and the importance of these records; in fact, no large ewspaper would think of letting its local news nent try to get along without this record.

the milk industry has done little in a matter of nd. We are developing a new spirit of business accounting methods, but very few sales depart- of milk plants are equipped with the sort of infor- they should have in working up stories of milk

is useful in many ways, this library,'' according ris. ''I don't know much about ad writing, ex- hat I've learned from reading, particularly from eople's advertising. Sometimes I learn **not** to do a thing as well as how to do another. But I get the best ideas of the other fellow. A man coming into our plant the other day said he was surprised to find so many New York ideas in a small-town plant. I don't know so much about New York, but I am after good ideas on selling milk, regardless of where they come from, or who offers them.''

Another feature of this interesting library is the ''Sales Suggestion Book.'' This book records the ideas of the salesmen of the plant on milk. There is, of course, a sales conference once in awhile. As each man makes a suggestion it is written down in the book, and, after the suggestion has been carefully checked up and followed out, the man is graded according to the worth of the suggestion.

At the end of six months a list of the points is made and the winner is given an appropriate prize.

The book goes further: It gives the sales record—actual sales record, that is—of every man, and if a customer drops off one man's route he is given a red mark; if one cuts down on his milk order he draws a blue mark. If he induces a customer to increase and order he is given a silver mark. An entirely new customer wins a gold mark.

''There may be some men who believe there is genius to merchandising,'' says Morris, ''but I think there is nothing to it; it is system, it is studying out the science of the game, but more than that it is studying out and keeping records of simple events that escape most folks.

''I do believe that more has been gained and lost in this world through taking advantage of or overlooking simple things than through any other cause. Now, I have a number of books here that don't relate to milk in any way, and some of them don't even relate to merchandising, but I get good ideas out of them. It is surprising at how many of the broad, simple truths of life are applicable to the milk business, as well as to other lines of industry.

''I have books here on philosophy, on pedagogy, on social research, on raciology, and I get something out of all of them. Of course, I don't have to study raciology to find out that negroes like buttermilk, and I am frank to say the only way really to study the negro is to live and grow up where they are populated.''

Jake Morris doesn't know whether he is an educated man or not. He frankly says that he thought a degree from a university would settle his claim to an education, but, in his terms, ''since tackling the business of selling milk on a scientific scale. I have come to the conclusion there is a great university of milk merchandising through which any man in this industry must pass before he can really be selling the milk he should. I think if one analyzes the figures, I am making about as much money out of this business, in proportion to investment, as any other milk dealer in the country. Yet I feel that I am a long way from having mastered this study of selling more milk; it is a deep, intricate matter.''

Yet, despite his own statement, one sees the Morris plant conducted in the simplest manner possible, with little or no red tape, with an absence of the passing of the buck, with a directness and straightforwardness that is the full height of simplicity.

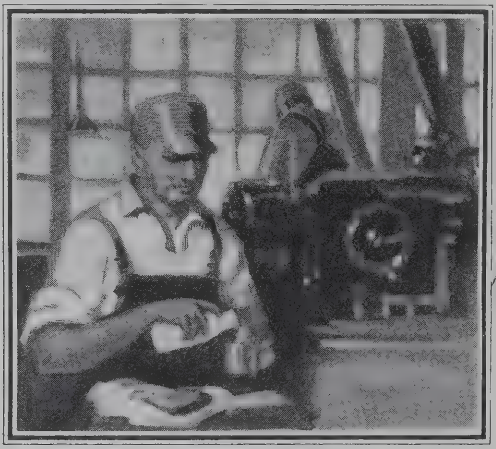
Labor Gets the Milk Habit

A New Idea in Personnel Service that Meets the Workers' Approval While Improving Their Health and Efficiency

By F. R. McINTYRE*

MANUFACTURING and milk production are the two greatest industries in Wisconsin. The smoke stack and the silo are the twin towers of prosperity in this state. In the factory region of eastern Wisconsin are found the greatest fluid milk producing farms of the state, and there is more net profit in selling fluid milk for the farmer than in turning milk into butter and cheese.

The Wisconsin Manufacturers' Association has fostered a successful campaign to install milk service for employees during working hours, and more than one hundred factories are also inserting "milk for health" messages in the pay envelopes at least once a month.



Individually, this new idea in management gives health and strength to the workers and staves off fatigue, thus promoting better morale and sounder working conditions. Collectively, the factories in this alliance are patronizing a branch of the industry which consumes a large share of their varied commodities in the nearby home markets.

Being thus economically sound and diplomatically advisable, the shrewd manager willingly adopted the milk service idea. And now he finds it promotes regularity in duties and decreases idleness, sickness and inefficiency among thousands of his employees.

Started as a manifestation of the slogan, "Farm and factory must prosper together," the milk service campaign has had more than a year's test, with results altogether encouraging and illuminating to even the most skeptical managers.

Two of the largest factories in Wisconsin, the Allis-Chalmers and the Seaman Body Corporation, are absolutely "sold" on the idea and would not return to the milkless era of factory management.

Not only are such factories in the larger cities interested in the adoption of the milk service idea, but the smaller plants located in small towns right next-door-neighbor to the dairy farms have taken it up and find it equally advantageous.

The Van Brunt Company, located at Horicon, arranged at first to supply about 135 pint bottles of fresh milk daily to their crew of about 300 men. Within a few months the milk snack took such a hold upon men that 250 pints were being sold daily, and the milk consumption in the village increased fifty pe as a result of the campaign in this plant alone. company installed an icebox and furnished the ic engaged a school boy to deliver the bottles to th and collect the empties at one-half cent each. Th is paid by the dairyman, who gets five cents a pint

"We hope this plan will be adopted by all emp in the state," says the manager.

The Kimberley-Clark Company reports on the at two of its plants—at Niagara and Kimberley. consumption at the Niagara plant lunch roon jumped from two gallons daily to eleven gallons, Kimberley it has run from 1,800 quarts daily to quarts.

At the Fort Howard Paper Company, Green Ba milk is delivered to the plant at 8:30 every morn pints and half-pints. This milk is carried into th tory and put into a cupboard refrigerator in cha an employee stationed in a central part of the fact

Handling the Milk Service.

The half-pints sell for three cents and the pin five cents each. Tickets are issued by the factory dollar each. The tickets have 25 three-cent punche 25 one-cent punches, which work out for both pint half-pints. They provide a ready means of obta milk without stopping to make change.

Service hours are nine in the forenoon, noon three in the afternoon. Departments close to the s man allow employees to get their supply. Depart further away appoint one man in their division comes about five minutes ahead of the service h get the amount which the men in his section desir

He carries each individual's milk ticket punched, and the milk dealer furnishes metal car trays for taking the bottles to the departments. empty bottle trays are returned on the next trip.

This company has also arranged for service to workers, secured through the watchman who car key to the milk cupboard.

"A product with the food value of milk natural creases the vitality of the men, and this means incr production and better service," says the manager.

Milk Replaces "Soft Drinks."

When the employees of the Glancy Malleable poration, Waukesha, got their daily milk drinks the corner grocery at noon, the consumption was 15 pints daily. In less than three months after service was installed at the factory, their average consumption rose to 250 pints—which is pretty goo a plant employing 258 people.

On extremely warm summer days the plant cons more than 300 pints, and there was no demand fo or fizz beverages while the milk supply lasted. So f has the milk drink habit become established there cool fall weather sees little or no reduction in the s daily average of a pint per capita.

The Janesville branch of the Fisher Body Com s that in four months since the milk stimulation as started, the average daily consumption among ployees has risen from 80 pints to 160 pints.

THE MILKMAN.

s it plods the lonely street, braves the weather—
and sleet, that we may call our breakfast sweet?
The Milkman.
while we dream of pastures fair, gropes up the
apartment stair with pasture—joys—and leaves
there?
The Milkman.
it, as he goes his way, up two long flights, finds
s that say: "Yes, we don't want no milk today?"
The Milkman.
it must humbly grin, when, at the door, his bill
in? Who hears it said: "Come back again!"
The Milkman.
it that must sleep by day; while others rest, be
is way? Who seldom gets a chance to play?
The Milkman.
it that his own child knows as some strange man
comes and goes? Who is that strange man, you
ose?
The Milkman.
it all the babies know will be there, sunshine,
or snow? Who joys to see the babies grow?
The Milkman.
it strives so hard to be a faithful friend to you
me? Who answers man's first walking plea?
The Milkman.

SIDENT COOLIDGE'S FORMER MILK MAN DEAD.

ob Diemand, aged 75, who for 15 years delivered the Northampton, Mass., home of Calvin Cool- ied at his farm the first part of May.

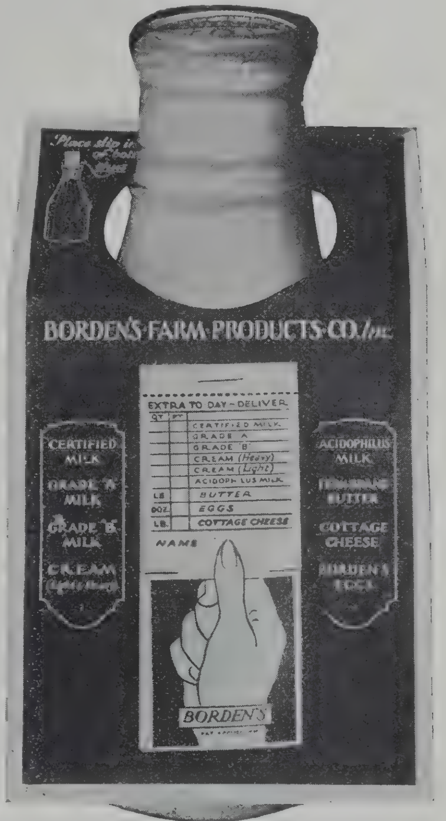
mand always boasted that Mr. Coolidge was one former satisfied customers.

NOVEL ORDER FORM MEETS A REAL NEED.

(Courtesy of Printers' Ink Monthly.)

In some sections of New York City and suburbs recently Mr. Younghusbands in retrieving the morning bottle of milk from the back porch found attached thereto the cardboard form shown in the illustration at the right.

After it had been removed from the head of the bottle it received its due share of attention from both husband and wife—the latter especially, thought it an excellent idea as it would facilitate ordering additional milk or cream. Mr. Younghusband also lent his ecstatic approval. He it was, he ruminated, to whom fell the job every so often of inserting a piece of paper with an order on it into the neck of the milk bottle. He could testify from past experience that at times the slip had fallen into the bottle and he then had tried to retrieve it. . . .



The Borden Company has taken cognizance of the multifarious hardships accruing from this complex system of ordering milk and the illustrated card was the result of a desire to be of assistance.

It also must have been the Borden delivery men who first had objected to the paper slip idea because the new order form materially benefits them, too. The order form is a little pad attached to the big one as shown. It has spaces for ordering various Borden products and is perforated at each side so that the bottom half can be folded to slip into the neck of the milk bottle. When this is done the order projects above the bottle top and readily can be copied by the milkman. The small picture at the upper left of the form shows the housewife how it is to be inserted in the bottle and this illustration automatically prevents the milkman from degenerating into a milk bottle fisherman.

The card also suggests various Borden products, and, since the order form is in somewhat frequent use, brings them constantly to the consumer's attention.

This idea of Borden's is commendable chiefly because it is simple to use and because it fulfils a need on the part of the company's customers. Order slips that they insert themselves are so often lost or misinterpreted that a surer method of having the order filled is certain of a warm welcome.

BUREAU CONDUCTING STUDY.

In an effort to discover the important causes of sudden increases in bacterial content of bottled milk, the bureau of dairy industry of the Department of Agriculture is conducting a study of more than 100 representative plants throughout the United States.

What the Courts Say:

By LEO T. PARKER. *Attorney at Law, Cincinnati, Ohio*

Facts That the Milk
Dealer Should Know

Parker's Important Higher Court Decisions Rep

IN VIEW of the numerous previously decided cases, the law is well established that the pure food statutes were enacted as a means of protecting the people against the sale of unwholesome food by manufacturers and all vendors.

In a quite recently decided case, the court explained the liability for selling adulterated food, as follows:

"In the first place, the offense created by the statute belongs to that class in which knowledge, or guilty intent, is immaterial, and need not be shown in order to justify a conviction. It falls under the general rule that statutes which declare the doing of a certain thing shall constitute an offense against the public, without reference to whether done without notice, or with guilty knowledge. In such cases it is the act itself, not the intent, that determines the guilt; the actual harm to the public is the same in one case as in the other. The distribution of impure or adulterated food for consumption is an act perilous to human life and health—hence, a dangerous act—and cannot be made innocent and harmless by the want of knowledge or the good faith of the seller."

Therefore, it is quite apparent that manufacturers, wholesale and retail dealers may be liable for the sale of adulterated food irrespective whether or not they are aware that the offense is being done.

For instance, in a quite recently decided case (171 Ind. 547), it was disclosed that a dealer was prosecuted for selling oleomargarine for butter. The facts of this case are that at the time of the sale the store was in charge of a clerk and the act was done without knowledge or authority of the employer.

It is important to observe that the court, in holding the employer liable, said:

"Guilty intent is not an element in the crime, as we have seen; hence, the rule that governs in that large class of offenses, which rests upon criminal intent, has no application here. Cases like this are founded largely upon the principle that he who voluntarily deals in perilous articles must be cautious how he deals. The sale of oleomargarine in an adulterated form, or as a substitute for butter, is a crime against the public health. Whoever, therefore, engages in its sale, or in the sale of any article interdicted by the law, does so at his peril, and impliedly undertakes to conduct it with whatever degree of care is necessary to secure compliance with the law. He may conduct the business himself, or by clerks or agents, but if he chooses the latter, the duty is imposed upon him to sell the article to the public in obeyance of the law in the manner of selling; otherwise, he, as the principal and the responsible proprietor of the business, is liable for the penalty imposed by the statute. We do not believe it was the legislative intent that such proprietor should escape by showing that an unlawful sale made by his clerk was unauthorized."

In another recently decided case it was disclosed that a dairyman delivered milk at a railway station for transmission to the purchaser. While the milk was standing at the station at its destination it was inspected and
found to be adulterated. The evidence disclosed t
dairyman had delivered pure milk to the railw
tion and that the adulteration took place with
knowledge in the transit of the milk at the railw

This court held the dairyman liable, and said:

"There is, as it seems to me, no material dist
between the case of adulteration by a servant
the authority and against the express orders of h
ter, and adulteration by the fraudulent act of a st
The legislation on the subject was intended to be
and the offense was created quite independently
moral character of the act."

In another case where the same point of the l
involved it was disclosed that a servant while
within the scope of his authority in delivering mil
terated it without the knowledge of his employer
also, the court held the employer liable, and said

"I think myself that the master for all purpos
be deemed to be the seller of the milk; that is to s
impossible to say that he is not a seller of the milk
I think, however, that it is not necessary at all t
man who sells the milk, that is to say, the princ
seller, is necessarily to be taken to be cognizant
adulteration, the law making it, I think, an off
adulterated milk is sold in point of fact."

On the other hand, the courts have consistent
that a proprietor is **not** liable where an employ
is without authority to sell goods takes it upon
to sell and deliver adulterated products.

For illustration, in a recent case it was disclos
impure milk was sold by a boy who, although
in the service of his employer, was employed spec
to wash cans and was not authorized to sell mil
never had sold milk at any time previous.

In this case, the court held the employer **not**
and said:

"It is fairly shown that the milk belonged t
sing, (employer), it was sold out of his cans and
his wagon. Diersing says he never authorized
sell any milk; that the boy never did sell milk
boy could not bind Diersing unless Diersing aut
him to sell, and such authority is not shown in
and satisfactory way by showing a simple sale
boy."

In still another case, where a delivery boy was
guilty of having adulterated milk in his possessio
the intention of selling it, the court held the em
not liable and in effect explained that for an em
to be liable where milk is found in the possessio
employee, it is necessary for convincing evidence
introduced to show that the employee had actual
it. However, if the boy had sold any milk, the em
would have been liable.

In another case where a state statute provide
whoever sells milk not of good standard shall b
ished by a fine, it was disclosed that an employe
tentionally delivered milk below the percentag
scribed by the statute. Legal proceedings were

A glimpse into the model plant of the Clicquot Club Company at Millis, Mass.—painted with Barreled Sunlight for lasting cleanliness and better light

ainted with arreled Sunlight . . .

This famous plant is kept light, cheerful and sanitary

THE testimonial letter reproduced above is just one of the many that tell how Barreled Sunlight increases efficiency by improving working conditions. More light and lasting, sanitary cleanliness.

Experience has shown the Clicquot Club Company that to keep ceilings and walls white, lustrous, immaculate—without frequent repainting—nothing takes the place of Barreled Sunlight.

* * *

A pure white finish that reflects light of just the right quality—free from glare.

A surface so smooth it can't hold dirt embedded, and washes like tile.

Guaranteed to remain white longer than any gloss paint or enamel, domestic or foreign, applied under the same conditions.

Will not flake or scale if properly applied.

Yet with all these advantages, Barreled Sunlight costs no more on the finished job than many paints priced less per gallon! It flows so freely and covers so well that *less paint* is required; and is so easy to apply with brush or spray that there is also a big *saving in labor.*

Sold in 55- and 30-gallon churn-equipped steel drums, and in cans. For priming, use Barreled Sunlight Undercoat. See coupon.

U. S. Gutta Percha Paint Co., 9 Dudley Street, Providence, R. I.—New York, 420 Lexington Ave.; Chicago, 659 Washington Blvd.; San Francisco, 156 Eddy Street. Distributors in all principal cities.

tuted against the employer and the court held him liable. In this case the court, in effect, explained that no criminal intent on the part of an employer or his employee is necessary in order to render him liable for a sale in violation of a state law. And. further, that an employer is equally as liable where an unintentional sale is made by an employee in the course of his employment, as if the sale is intentionally made with the knowledge of the employer.

In still another case, where the same point of the law was involved, it was shown that an employee unintentionally delivered a pound of imitation butter to a customer, who had ordered creamery butter. In this case, also, the court held the employer liable. This court said:

"The offense was of that class in which it is not necessary to prove any guilty intent. If the defendant engaged in the business of selling imitation butter, whether he conducted it by himself or his agent, he was bound at his peril to see that the provisions required by the law in the management of it were observed."

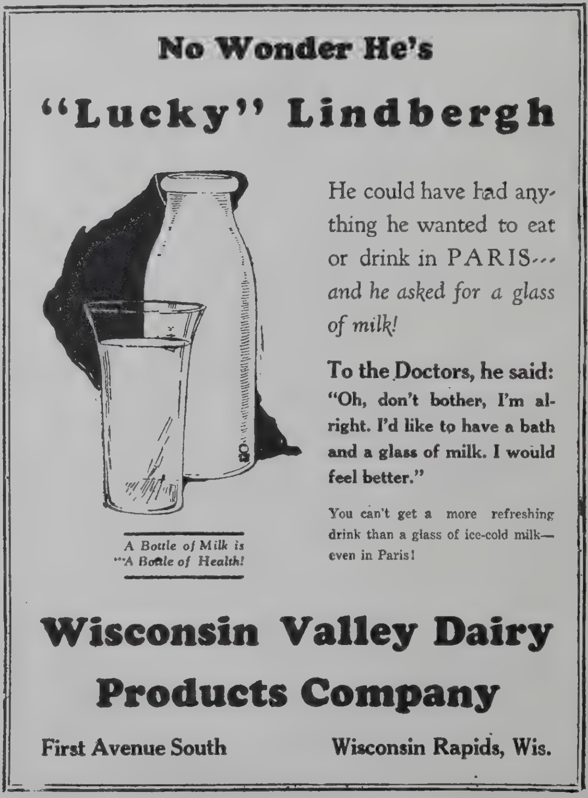
In still another case it appeared that the employer gave the exclusive possession of adulterated milk to an employee. The authorities discovered the milk in the employee's possession and promptly instituted suit against the employer. In holding the employer liable the court said:

"It is the general rule of the law that the possession of a servant is the possession of the master. In the present case, we think that the evidence showed that the milk was still in the possession and under the control of the defendant (employer)."

⁂

THIS IS THE WAY ONE WISCONSIN COMPANY TOOK ADVANTAGE OF AN OPPORTUNITY.

A couple of days after "Lucky" Lindbergh landed in Paris the Wisconsin Valley Dairy Products Company, Wisconsin Rapids, Wis., ran the accompanying advertisement in the local press. It created much favorable comment and was a decided boost for milk in that locality.



No Wonder He's

"Lucky" Lindbergh

He could have had anything he wanted to eat or drink in PARIS— *and he asked for a glass of milk!*

To the Doctors, he said:

"Oh, don't bother, I'm alright. I'd like to have a bath and a glass of milk. I would feel better."

You can't get a more refreshing drink than a glass of ice-cold milk—even in Paris!

A Bottle of Milk is "A Bottle of Health!

BOWMAN DAIRY CO. LAYING IN SURPLU SUPPLY OF MILK.

The Bowman Dairy Co. is at the present time
chasing a surplus amount of milk in order that a
cient quantity will be available during August, Se
ber and October, which months are termed the low
of production. Daily receipts at Janesville, Wis.,
excess of 100,000 pounds.

Transportation is now by tank trucks, which the
pany says is rapidly replacing the old method of
porting milk in eight or ten gallon tin cans.

The trucks in use here use a glass lined tank
lated with cork so that when the milk is cooled
degrees or lower, and placed in them, it will ho
temperature to within two to four degrees for 12
hours. Larger tanks of the same type, mounted
press cars, now in use quite regularly in this section
hold milk at about the 40-degree mark for 24 hou
longer, permitting it to be shipped for 300 to 400

"The growth of our milk recipts in Janesvill
last few years has been constant, and many imp
ments in the way of equipment on the farms have
installed enabling the dairymen to more easily pr
milk in a sanitary way," M. J. Metzger, secretary
Bowman Company, says.

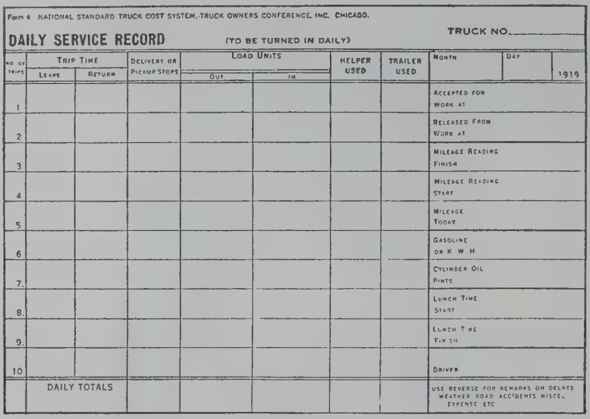
What About Your Delivery Service?

What Are Your Trucks Costing You? Take Away the Scare from that Bug-a-Boo, "Truck Costs."

By PHILLIP L. SNIFFIN*

SAM BROWN, head of the Brown Milk Company, runs a fleet of five delivery trucks in his business. Sam is a keen-minded, alert business man, anxious to save money and improve his business wherever he can. Already he is frank to say that he is considerably "fed up" on this delivery cost subject. At the start his competitors were delivering to small grocery stores at certain prices and he knew that he would have to meet them. Naturally he had to put on trucks to do his work.

Later on, he made some close calculations to find just what this delivery service was costing him and computed his margin to cover it. At once he found that his competitors were charging less than his actual cost prices including his overhead. So Sam had the choice of meeting their prices or losing a lot of business. He chose the former.



Form 4 NATIONAL STANDARD TRUCK COST SYSTEM.-TRUCK OWNERS CONFERENCE, INC. CHICAGO.

DAILY SERVICE RECORD (TO BE TURNED IN DAILY) TRUCK NO.________

No. of Trips	Trip Time		Delivery or Pickup Stops	Load Units		Helper Used	Trailer Used	Month	Day	1919
	Leave	Return		Out	In

9.								Lunch Time Finish		
10								Driver		
	DAILY TOTALS							Use reverse for remarks on delays weather road accidents miscel. expense etc.		

Form 4—Daily Service Record for Drivers. Size 4½x6½.

Now Sam has good reason to feel pretty much upset. He had added, at one lick, several thousands of dollars to overhead with nothing in sight to balance the other side of the ledger.

Somebody is to blame. It looks as though a lot of city milk dealers have tumbled over themselves to get ahead of their competitors, without calculating what this kind of service costs. No wonder Sam and hundreds of other men like him look upon this subject of motor truck deliveries as a bug-a-boo to the industry and begrudge the money they must spend to run their equipment.

The fact that a concern which does not know its costs must soon fail is small consolation to the man who **does** know his costs and who covers them completely in his selling price. The competition is there and it is keenly felt as long as the other firm lasts. And perhaps when one such competitor has "spent his wad" and died out, another will spring up who is just as poor a transportation agent and he, too, will thoughtlessly be making unfair competition as long as his money lasts.

So it is a serious problem to the milk industry, this problem of truck costs. And only when the essential information on costs is brought before the industry time and time again, until each individual milk dealer makes some figures of his own to see what this part of the business is costing him, will the problem be straightened out.

The Way Trouble Starts.

What usually happens is this: A man decides
in for truck transportation. He spends a certain a
of money on equipment and considers this, off-hand
a necessary capital investment as a part of doing
ness along with similar items.

If he is trying to be fair with himself and cov
costs in his selling price, he figures the **running** ex
of his trucks. Gasoline, oil, drivers' wages and p
tires, are obvious costs that he might compute an
into his cost of doing business.

Soon, however, his trucks begin to wear out.
older they become the higher the repair bills w
Before long they will have to be replaced wit
trucks. And where does the money come from?
the business, of course. But, how? And that
problem.

How to Figure Truck Costs.

Now, getting down to the real facts in the case
see just how a concern should go about it to fi
true cost of its transportation. Here is a list which
all the items which must be taken into account in
ing delivery costs:

Fixed Charges—
- Amortization (reserve for depreciation).
- Interest on investment.
- Insurance
  - Fire, transportation and theft, public liabilit
  - property damage, collision.
- Taxes.
- Licenses.

Maintenance Charges—
- Garage
  - Rent, heat, light, power, etc.
- Repairs
  - Materials and labor.
- Tires.
- Painting.
- Overhauling.
- Administration requirements.

Running Costs—
- Gasoline (or electric power).
- Oil.
- Wages of drivers.
- Grease, kerosene and waste.

Among the "fixed charges," a few words of
tion are in order. The total investment of the
ment is figured minus the tires, because these are
care of separately among maintenance charges.
investment is best depreciated on the basis of the
ber of miles traveled in the period, that is, pro
according to the estimated mileage life of the v
which varies according to the size and make of
Tires are depreciated in the same way, but separ
because they have a different figure of mileage

Interest on the investment (one of the fixed ch

What Forms Are Necessary?

th the above outline of desired information as the ve, we are now ready to see how this information obtained. Although it will be impossible to give m which will be flexible enough to meet any in- al set of conditions, the following points will be le in indicating what kind of records are neces- In working out a cost-record system, many con- make the mistake of requiring too much of the s' time and expecting too much of his intellectual y. Wherever possible, this work should be done bookkeeping department.

Driver's Daily Report. Some method of record- e driver's work, vehicle expense, mileage, etc., lay to day, is obviously necessary. The driver's report form usually works out very similar to a ok in a bookkeeping system and the items shown re later entered on summary records by the cleri- partment. Many concerns provide each driver pad of printed slips, one of which is turned in day. On this he records purchases of fuel, oil, hich are later checked with garage invoices.

this slip he also gives his performance records day. For example, at the end of a day's run, rts his speedometer reading. At each unloading ds collected or loading of goods to be delivered, rts the number of orders in the proper space n rd. Finally, the number of round trips made in y is often required.

above is all that is really required of the driver as cost keeping is concerned. There are no diffi- to be met in most cases in getting this amount of ation accurately because a daily report form of nd contain nothing which is too much to expect drver. Most attempts to go beyond this to get data are dangerous.

final point worth mentioning about the driver's report is that many concerns find it advisable to space on the card for the driver's report on the on of the vehicle. This is often very helpful in aging drivers to report irregularities of running may be adjusted or repaired in their early stages, ving considerably on later repair bills.

Truck Day Sheet. The dricers' daily reports e turned in to the clerical department and here zed and put together in some systematic manner. uck day sheet answers this purpose. There is one er truck per month. The days of the month are horizontally and the various items which are en- each day are ruled vertically. These items are a recapitulation of the driver's reports. At the of the column, where it is summarized at the end month, provision is made for adding the repair s which have been incurred against that truck the month (See point four below) and any charges directly chargeable against the month, such as tire cost (according to mileage), driver's and helper's wages, garage rent, grease supplies, etc. The result is that the final figure represents what it has cost to operate the vehicle during the month with the exception of the fixed charges and those costs which are rightfully to be distributed over 12 months in the year. These latter costs are taken care of in this way: There may be a space allowed on the sheet set aside from everything else, where large current cost, such as overhaul, painting, fines for traffic violations, etc., are inserted. These together with the fixed charges (depreciation, interest, taxes and license) are usually carried over month to month and finally computed at the end of the year. Or they may be so arraned that the large current costs may be divided by 12 and the fixed charges per month added as they are. Thus, the owner has at least an approximate figure at the end of each month which he may use as his guide and compare with other months, and other vehicles.

3. Monthly Summary of Fleet. This form is a very simple one to understand, it being a recapitulation of the truck day sheets for all trucks in the fleet, made up at the end of each month. This also is computed on the monthly basis and finally recapitulated at the end of the year.

4. Daily Repair, Stock Room and Maintenance Report. In order to keep track of each vehicle's maintenance expense, some form is necessary which will supply the information to be inserted on the truck day sheet for the items of repairs, overhauling, mechanic's time, washer's time, greaser's time, etc.

The way in which this is taken care of varies a great deal from one concern to another simply because every concern has a different method of having this work done. Regardless of whether inspections, adjustments, repairs, washing, greasing and oiling are done by drivers, helpers, employed mechanics or by an outside source, the point to remember is that all time charges, materials, parts or invoices should be charged individually against the vehicle for which the work was done.

When service such as this is done on the outside, it is a simple matter to request that invoices be itemized according to the vehicles and then entered on the truck day sheet. Work done by the driver or helper is often not charged against the vehicle, excepting the materials used, inasmuch as this is included in the item of wages.

The concern that operates its own service and garage facilities will need a separate bookkeeping system for this, which will be very much the same as an accounting system for a business for itself. For our present purpose in this article, there is no need to complicate the subject by attempting to bring in the cost keeping requirements of a private garage and repair shop other than to mention briefly the following essential forms.

a. Mechanics and Helpers' Time Card. This is a simple time sheet daily record, giving the amount of time spent in repair on each vehicle, with materials used. The materials entered here are later checked with the daily stock room report (b), the price computed and charged

The Monthly Record Sheet.

in a lump sum with the time taken for the job on the truck day sheet.

b. Daily Stock Room Report. Parts, supplies and materials taken out of the stockroom by workmen are entered on this form. Many concerns carry this as a perpetual inventory by means of which they can know at all times ,how much stock is on hand and when stock needs to be replenished.

c. Job Ticket. Overhauls, lengthy repairs and painting, when done in the company's own garage, are best handled by job tickets. This is usually a manila card about nine by twelve inches, on which are entered all items of time and materials chargeable against a certain job on a vehicle.

d. Maintenance Chart. While this is not a part of the cost keeping system, it is mentioned here while speaking of garage forms because the writer urgently recommends it to any concern that handles its own service work. There is a maintenance chart for each truck under this plan and this may be conveniently placed on the wall of the garage in the vehicle's customary parking position. When oil has been changed in the motor, when parts of the truck have been greased or oiled, inspections made of the chassis, tires, etc., when water has been added to the battery and when carbon has been removed, valves ground, etc., this is marked on the maintenance chart. In this way, neglect of maintenance is avoided and periodical attention to these details is provided for in a systematic way.

5. Tire Record. This is an optional form, not entirely necessary but one which many concerns are finding very valuable. The tire record usually is in the form of a history card, there being one card for each tire in service and it shows the amount of service each tire has given and the cost per mile from the time it is purchased until it is scrapped. In detail, the garage superintendent enters the time it is bought, the different cars on which it was used during its life, the wheel it is used on, and the mileage of each wheel. The cost of the tire is also entered and at the end of its life, the cost per mile, including repairs, is obtained. This record is not only valuable in encouraging drivers to keep tire costs down, but it helps to make the cost system more accurate insofar as this item is concerned. Moreover, it supplies an excellent method of comparing different makes of tires and determining which the concern can use more profitably.

The above suggestions on cost-keeping forms provide what is, in the writer's opinion, the best skeleton outline that can be offered in such a general way, considering the great difference in conditions from one concern to another. An individual study based on this as a guide should be very productive in reaching the ideal system for an individual business.

Cost Keeping Pays Its Way.

Some concerns try to make too hard a job of keeping delivery cost, bringing in many difficult ideas and methods with the hopes of getting additional information. The more we observe some of these systems, the more we are convinced that the most satisfactory system is the one which is, first of all, as simple and as "foolproof" as it can be. That is why the writer has suggested here just the very simplest form of cost keeping which will serve the purpose satisfactorily.

It must not be assumed that the detail necessary to keep records on trucks is just an added curse to the whole delivery idea. Many truck users have told us that they feel this way about it and I have tried to point out to them that the right kind of a record system will pay its own way in the economics it will permit.

The owner who keeps a constant check on his operation will find that this helps reduce cost in ways than one. With itemized records before him day to day, he will find that many leaks will be ered and ways for improvement suggested that occur to him in no other way. As an example let us see briefly how a daily check would work reduce fuel cost.

A truck in good condition will operate under loads and over average roads at, say, ten miles gallon of gas. This will be shown on the daily But a constant inspection of this will disclose that ually or perhaps suddenly only five or six miles ing obtained for each gallon of gas. The record a barometer that gives warning that something is and that an inspection is required at once.

Sometimes dragging brakes may be respo again it may be that the carburetor requires re ment. Whatever the fault is, attention is called the trouble located and rectified, and the gasolin sumption reduced materially.

If this daily check is not made and watched, th ble goes unnoticed until some time later, when usually large operating costs are questioned or t a general overhauling of the truck.

In practically all cases where too much gas is used, there is a corresponding wastage of oil. Wh mixture is too rich, the oil is being diluted and its cating value lost. Where brakes drag more powe should be required is used with the extra consu of oil.

Keeping the gasoline mileage records and wa them will save a truck owner a substantial amou ing the year. Also it will be of value to him in a true picture of what his trucks are costing him erate. It is particularly valuable to owners of fl trucks, as it shows what make of trucks are th economical over a period of service.

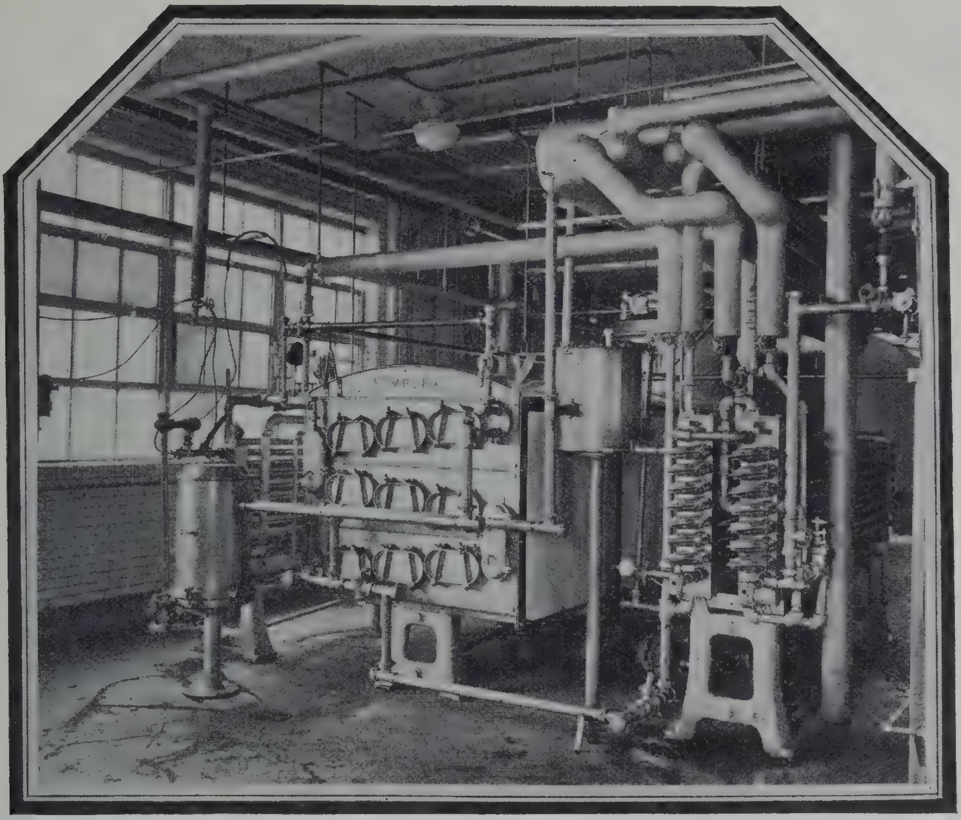
FIRE LOSS CAN BE CUT.

Evidence that well-directed effort can redu losses is forthcoming in an analysis of returns fr cities in the United States participating in the n fire waste contest, made by the insurance departm the chamber of commerce of the United States.

The 303 cities, with an aggregate population 592,095, showed a reduction in property loss for $4,146,282. A more striking reduction in the num persons killed by fire is shown for the same cities average total number of fatalities for the fi period, 1921-1925, 663, was reduced in 1926 to slight reduction in injuries due to fire was l shown.

The per capita property loss for 1926 showe duction of 14.96 per cent from the preceding fi average, in the face of an increase for the countr whole.

Prizes for the winning cities in the four class resented in the contest will be presented at the coming annual meeting of the national chamber grand prize has been awarded to Albany, Georg the second time, and other awards will be made waukee for having the best record in class one which includes those over 100,000 population; to boro, Ky., for the best record in class three cities, ing those having a population between 20,000 a 000; and to Huntington, W. Va., for the best re class two cities, including those having a populat tween 50,000 and 100,000.



Showing the 11-year-old Burrell Long Flow Pasteurizer in the new Mayfair Plant of the Bowman Dairy Co., Chicago, Ill.

After 11 YEARS' SERVICE *it was given* remier Position *in the* new Mayfair Plant

HERE is an 11-year-old Burrell Long Flow Pasteurizer which not only is still in service but is doing such supremely good work that the Bowman Dairy Company of Chicago has moved it into their new Mayfair Plant—one of the finest in the country. And in the new plant this 11-year-old outfit is pasteurizing the Mayfair's most costly product—*cream*. At the age when most pasteurizing outfits are headed for the scrap heap, the Burrell Long Flow is still worthy of premier position in one of the country's foremost milk plants.

Meeting the Demand for Cottage Chees

How to Make "Cheese That's Sweet and Good to Eat." Most Folk Like it and are Willing to Pay Well for a Good Product

By BYRON SPENCE*

COTTAGE cheese is as old as the hills. It is so old its origin is buried in generations and generations of history. And its popularity, like its age, increases as the years roll by. Probably there is not a farm in America where cottage cheese has not been made for home use sometime or other.

We like to call the cottage cheese served on the farm, the old fashioned kind. Old fashioned, meaning that it is characterized by a sour or acid flavor, soft and mushy body, and a dead white appearance. Some of us like this cheese—like the snappy sour flavor. But there are others of us, in these days of sweet butter, processed cheese, near beer and no wines, who seem to favor most heartily the foods of milder flavor. And so there has been developed, to meet what the members of the advertising fraternity choose to call "consumer demand," a new type of cheese. Its name, "sweet or rennet curd cottage cheese," suggests its essential characteristic, the use of rennet and the sweet flavor, which distinguishes it from other cottage cheese.

There is a very common way of making a sweet curd. It is to curdle sweet milk with rennet. Junket is a form of rennet, and Junket desserts, served in so many homes, are the best example of sweet milk curds.

The old fashioned cottage cheese is made by holding the milk at a warm temperature until it sours and curdles. The sourness of this curd is due to the free lactic acid formed by the action of certain desirable bacteria on the milk sugar, during this holding period. The following method of making sweet cottage cheese depends on the proper combination of these two methods of coagulating milk for cheesemaking.

Milk Used and Apparatus Required.

It is most desirable to use sweet, clean skim milk which has been pasteurized at 145 degrees F. for 30 minutes. If it has been flash pasteurized at a higher temperature some of the calcium salts may be destroyed and in order to insure the action of the rennet enzyme, it is well to add three to four c.c. of a 25 per cent solution of calcium chloride. No calcium is necessary if pasteurizing temperatures do not run over 145 degrees F.

An ordinary jacketed cheese vat, horizontal and vertical curd knives (preferably wire so you can vary the size of the curd particles) and a stirring rake are about all the apparatus one needs. Steam for heating the water in the jacket of the vat, and a goodly supply of cold water for cooling the curd are quite essential.

Adding the Starter, Rennet and Color.

The optimum temperature for the flavor producing organisms in a starter for cottage cheese is from 68 to 72 degrees F. The pasteurized milk should be adjusted to this temperature. Having adjusted the milk to the correct temperature, add from one-half of one per cent to one per cent of a good starter, such as is used to ripen cream for butter, milk for cheddar cheese, or to make cultured buttermilk. Any dairy supply house can furnish lactic ferment cultures for making starter. The milk should be well stirred so the starter will be thoroughly distributed.

The appearance of a food product has consid
to do with its sale, and for this reason it is very
able to add enough cheese color to give the fi
cheese a rich creamy appearance. It may be nec
to try two or three times to determine just the a
of cheese color required to give the desired shade.
by adding very small amounts, 2 c.c. to each
pounds of milk. Always dilute the cheese colo
water and stir the milk until the color is uniform
tributed. A good plan is to count the number of s
with the rake required to insure thorough mixin
then you know about how much stirring will be re
to mix the rennet into the milk. Never mix chees
with rennet, but always add the cheese color aft
starter has been added and before the rennet.

A seemingly insignificant amount of cheese
plays a very important part in making this chees
small is the amount of rennet required that th
almost a certain tendency, sooner or later, to u
much. In the words of a friend of the writer, "
like whiskey, can be used too freely." From 1 to
per 1,000 pounds of milk are usually sufficient.
the rennet with about 40 times its own volume of
before adding to the milk. It is always well
adding rennet, cheese color and starter, to walk
the vat, pouring it in as you walk, so that the liqu
be distributed the entire length of the vat rathe
dumped all in one spot.

About 12 to 14 hours will be required to obta
desired coagulation, so the best time to set the
usually late in the afternoon, and the curd will be
to cut early in the morning. When the curd i
enough to cut, it shows a "clean break." This
termined by inserting the finger in the curd obli
and slowly raising it to see if the curd breaks
over the finger.

Cutting the Curd.

The acidity of the whey at the time of cuttin
range from 0.5 to 0.6 of one per cent. The curd
just like a cheddar curd, first with the horizontal
lengthwise of the vat, and then crosswise or leng
with the vertical knife, to form cubes of the cur
ways insert the knife so it will cut its way int
not break up the curd. It is extremely importa
the curd particles all be of the same size, as a
curd particle will cook more rapidly than a larg
While the curd cannot be cooked so rapidly in
particles as in small ones, the appearance of the f
cheese will be the best if the curd is cut into cu
to 1 inch in size. As the curd particles shrink
erably when the whey is expelled by cooking, t
ished cheese will have curd particles much s
than ¾ inch in size.

How to Cook the Curd.

No part of the manufacturing process is mo
portant than cooking. The curd is heated very
and stirred only occasionally. Heat the curd wi
water in the jacket of the vat, never with live
Stir by hand just frequently enough to insure ev
tribution of the heat and do not cook so rapidly

Producers and Dealers in
Pure Pasteurized Milk and Cream,
Butter, Buttermilk, Cottage Cheese
Madison, Wisconsin

December 27, 1926

A. H. Barber-Goodhue Company,
Chicago,
Illinois.

Gentlemen:

For some years we delivered milk from our farms unpasturized. Late this summer we consolidated and now pasturize our product.

The question as to which style of equipment was quite a problem. After due consideration we purchased a Simplex Spray Pasturizer. It has met with our approval and soon thereafter we installed the second Pasturizer. We are now using two. We feel with satisfaction that we are securing a better product with the spray pasturizer which gives us a better cream line than we could do with the old coil vat.

We also believe Simplex Spray Pasturizer is superior from a sanitary feature due to elimination of stuffing boxes which to us spells a cleaner bottle of milk and our thought is well substantiated by our results.

We therefore, for the good of the milk business can heartily recommend Burrell Simplex Spray Pasturizers. Enclosed is a picture of our convenient installation of two Burrell Simplex Spray Pasturizers, Burrell Simplex Milk Filter, Titan Cream Separator, Burrell Simplex Surface Cooler and Milwaukee J. Filter.

Yours very truly,

MANDT DAIRY COMPANY

Better Results With Complete Barber-Goodhue Equipment

High speed, greater volume production — better quality products—limited floor space—that's one of the many, varied dairy plant problems submitted to our engineering department. How efficiently — how satisfactorily it was solved for one of our customers is best expressed in the view of the compact installation of complete Barber-Goodhue equipment, and the reproduction of Mandt Dairy Co.'s letter shown on this page.

You too may place utmost confidence in Barber-Goodhue service and equipment. If your plant is not operating as economically, as efficiently as it should — if you believe the quality of your products should be improved, if you need equipment or supplies—large or small—you'll do well to entrust your requirements to us.

Right now is the best time to ask for complete information and prices on your needs.

tough, cooked film surrounds each curd particle, making it impossible for whey to escape from the center of the curd. Do not be disappointed if it requires as long as two hours to warm the curd from the setting temperature to 100 degrees.

As the curd particles become more and more firm, due to the whey being expelled, they can be stirred more rapidly, stirred harder, and the rate of cooking increased. You now lighten your labors by stirring with the rake.

How to Tell When the Curd is Sufficiently Cooked.

Find a ten-letter word meaning "skill or practice gained by personal knowledge" and you have the answer. That word is experience, and experience only, can tell the cheesemaker when to quit cooking—when sufficient whey has been expelled from the curd, and when the curd is firm enough. No two curds are exactly alike—sometimes a cooking temperature of 110 degrees F. and then a temperature as high as 140 degrees F. may be necessary.

If we have accomplished our purpose, the whey should be removed from the curd, and when we break open a curd particle it should break clean, leaving a smooth glossy surface with no whey in the center of the particle. Likewise if the whey is gone from the curd, the curd should be heavier than the whey it displaces and sink to the bottom of the vat. From the appearance of the vat of curd we can, therefore, tell something about how near finished the cooking process is. Press a particle of curd with the thumb. If the dent remains for a minute it indicates that the whey is out of the center of the curd.

Gather up a handful of curd, cool it in a pail of cold water, and observe how much it shrinks. Press the cooled curd together in the hand. When released the curd particles should spring apart, retaining their original shape. If, on the other hand, they mash up like ordinary cottage cheese, they are not done. The curd should be cooked dry enough so a yield of 13 to 15 pounds of curd per 100 pounds of milk will be obtained. Having cooked the curd, push it toward the back end of the vat, make a channel through the middle and drain exactly as in draining a vat of cheddar cheese curd.

How the Curd is Washed.

Unlike many methods of washing and draining, the process here recommended is very simple. No draining racks need be provided, the curd can be drained and washed right in the bottom of the vat. After the whey is off, wash with two or three batches of cold water. Wash until every last trace of whey is removed and, for the last wash water, the cooler the better. Place the curd in a cooler and allow it to chill overnight.

Finishing the Job.

When it is cold, add salt at the approximate rate of one ounce to each ten pounds of curd. If desired, add a rich, heavy cream in such proportion as to give a fat content in the cheese of about two per cent. If the cheese is too dry for the trade, stir in a little cold water at the same time the cream and salt are mixed with the curd.

These methods are intended, not as an array of infallible rules to be followed to the letter, but as a guide to a method of making the most popular and appetizing cottage cheese that is manufactured in America.

* * *

Do you need a good superintendent, buttermaker or buttermilk man? We can find him for you, through a "Milk Dealer" Want Ad.

CHEMICALLY, AVERAGE MAN'S BODY WORTH 98 CENTS.

A report has recently been made to the N
Dairy Council, an organization promoting heal
child welfare, that, chemically, the average ma
feet ten inches high, and weighing about 150
is worth about 98 cents.

It is interesting to see how a man's market
divided. This is what the chemists say the huma
if made of:

Enough fat to make seven bars of soap.
Enough iron to make a nail of medium size
Enough sugar to fill a shaker.
Enough lime to whitewash a chicken-coop.
Enough phosphorus to make 2,200 match tips.
Enough magnesium for a dose of magnesia.
Enough potassium to explode a toy cannon.
Together with a little sulphur.

"There is no single food, except milk, which c
all of the chemical elements mentioned," says M
L. Lockhart of the National Dairy Council, in co
ing on the 98-cent chemical value of the huma
"As Dr. E. V. McCollum, world food authority
out, milk is rich in both calcium and phosphorus.
there are but two classes of foods that are relativ
in calcium, the principal element in lime and the
ant constituent of the substance of bone. These a
and the leafy vegetables."

According to Dr. Henry C. Sherman, note
chemist of Columbia University, milk contains c
magnesium, potassium, sodium, phosphrous, chlor
phur and iron.

Since the proportions which the chemists have
of the various elements show that there is more
the body than any of the other chemical constitu
is particularly important to realize that milk is th
source of supply for lime or calcium.

Trailer Equipment in Milk Hauling

Reduces Hauling Cost $.0102 Per Case Over Trucks. Total Saving is $31,132.00 a Year

Survey Made by A. C. Nielsen Company*

A FLEET of seven 10-ton Fruehauf semi-trailers, with two 5-ton tractors are used by the Gabel Creamery Company in the distribution of cases of bottled milk from its main plant at Detoit to four branches. When the first branch was started two years ago this type of hauling equipment was decided upon as promising the greatest economy.

In general, the advantages of trailers and tractors, as compared with trucks, are that each powered unit hauls a greater number of larger loads than are possible with a truck and the tractor is in operation a maximum, not being tied up during loading and unloading.

This Type Trailer is Proving Practical for the Gabel Creamery Company.

For this particular application the use of trailers eliminates the necessity for installing refrigerating plants at the branches, permits unlimited expansion at each branch by the purchase of additional trailers, and by eliminating handling of cases saves labor, and reduces bottle breakage.

Fruehauf Equipment.

The original purchase was of one tractor, two semi-trailers and one dolly. At present the branches handle 50 per cent of the company's business and are served with eight semi-trailers. One more is now on order.

In addition to the units handling cases, the company operates two tank units making daily trips from Washington and Romeo to Detriot, 30 and 35 miles distant. Each consists of a 5-ton truck with 1,300-gallon glass-lined cork-insulated tank and a 4-wheel Fruehauf trailer with 1,000-gallon tank. From Flint, milk is brought in by a trolley car carrying a 6,200-gallon tank. In rush periods this car draws a trailer carring 5,400 gallons. Regular daily trips are made. All tank units are unloaded by means of compressed air.

Routing and Loading.

For a typical day's work in delivering milk to branches a tractor will leave the garage at 7:00 A. M., pick up a trailer of empty cases at each of two stations, and will reach the main plant at 10:30. At noon it leaves for a third station with two loaded trailers, drops them there, picks up two loads of empties, returns to the plant, takes out two more loaded trailers to tions first mentioned, and then returns to the gar

The tractor has covered 41 miles on its two c trips, and each trailer 15 miles.

At the main plant the trailers are loaded by box men. At the branches the cases are loaded from the standing trailer to the wagons, by the of the wagon.

Capacity.

The trailers are equipped with large enclosed 18 feet long, 8 feet wide and 7 feet high, outsid walls, roof and floor are made up of two thickn wood sheathing with a layer of cork between, with sheet steel on the outside.

The capacity of the body is 360 cases, each 12 quarts. The average load is 300 cases. A full bottles weighs 65 pounds and when em pounds, making an average load of 19,500 pour summer, 2,000 pounds of ice is thrown on top cases.

Trailer-Tractor Costs.

Table A shows operating and unit costs for plete hauling unit of tractor, dolly, and two The total cost of the tractor including fixed driver, gasoline, oil, repairs and tires amounts t per day, or $.367 per mile.

The cost of the trailer is made up almost ent fixed expenses, tire and repair expense being l repairs practically negligible. The total cost semi-trailers and one dolly is $4.53 per day, or $ mile. Per case of milk, the total hauling cost is

Truck Cost.

Trucks have never been used for this work figures are available to show the cost with truck ment. However, in Table B, comparative haulin have been calculated assuming that a 7½ -ton tru a 14-foot body could haul 280 cases per trip. truck could make the two trips per day now ma the tractor but would have no reserve capacity of time lost in waiting for loading and unloadi

One of the Fleet of Trailers Which is Effecting a Real for the Detroit Creamery.

On this basis the cost per day for a truck wo

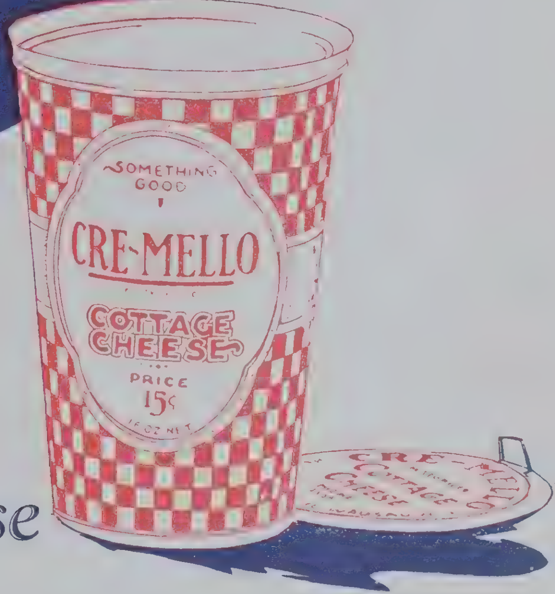
TULIP NESTRITE CONTAINERS



SOMETHING GOOD
CRE-MELLO
COTTAGE CHEESE
PRICE 15¢
CRE-MELLO
COTTAGE CHEESE

The perfect container for packaging cottage cheese

A Few of the Reasons why You Should use Tulip "NESTRITES":

- Most practical method of packaging.
- Low cost.
- More sanitary.
- Bright attractive finish.
- Permits of individuality and originality in package.
- Keeps contents in perfect condition.
- Any style or type of printing in any combination of colors.
- Patented wire pull lid.
- Pleasing shape.
- Made in all sizes from 2 oz. to 32 oz.

MODERNIZE the packaging of your cottage cheese, by using Tulip "Nestrite" Containers! It is the proven, practical method of packaging and its cost is slight.

A "Nestrite" packaged cottage cheese gains immediate consumer acceptance because it is sanitary, clean, attractive in shape, bright in finish, and permits the manufacturer to give originality and individuality to his package. Any style or type of printing can be furnished and in any combination of colors.

The bright gloss finish, an exclusive feature of "Nestrite" containers, not only makes a more attractive and pleasing package, but it likewise keeps the contents in perfect condition.

Tulip "Nestrite" Container lids are press fit, and have our exclusive and patented wire pull feature, making them the most convenient, easy, simple and positive yet devised.

Tulip "Nestrite" Containers are made in all sizes from 2 oz. to the 32 oz. Let us quote you on your container requirements. Write for samples and prices. No obligation involved.

"DRINK BUTTERMILK FOR HEALTH."

"Drink Buttermilk for Health" is the sloga which George Aug, Cincinnati, O., has built a large ness from very meager beginnings. Thirty years Aug entered the buttermilk business with a one- wagon and a hand butter churn. Now he is doing ness in a new two-story concrete plant at 234 E. C Avenue.

Eight trucks are delivering 4,000 quarts of b milk a day. His business has outgrown his qua three times in seven years.

"The influence of newspaper advertising in bui a business is tremendous," Aug said. "Of course, cess always is an up-hill fight. But it is easier you're selling buttermilk than some luxury.

"A large part of the increase in our business i to buttermilk diets being prescribed by doctors."

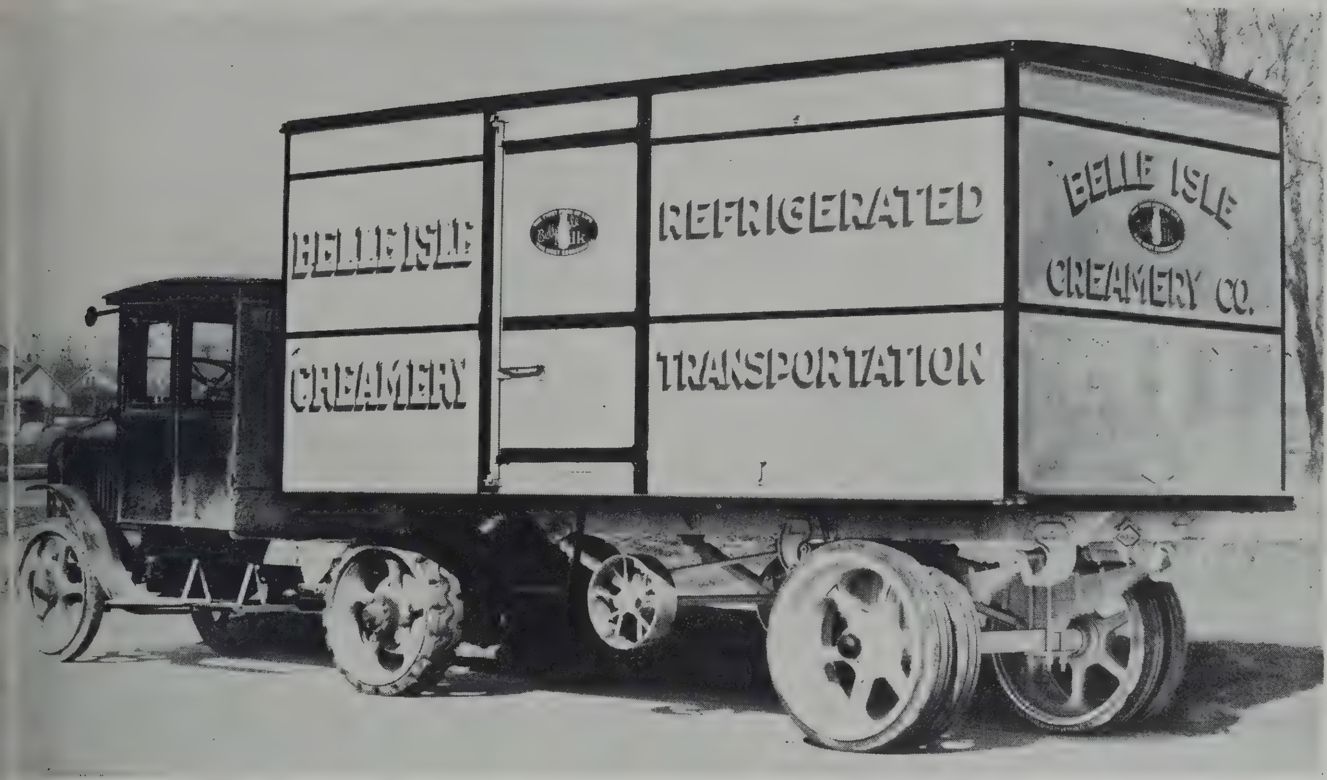
LORD CARNEGIE TAKES PERSONAL PART MANAGEMENT OF HIS DAIRY.

Lord Carnegie, the eldest son of the Earl Sou and husband of Princess Maud, has established at Farm, Kincardineshire, Scotland, a herd of ped Ayrshire cows, all of which have passed the tuberc test. Lord Carnegie is taking an active personal in the management of the herd and experiments a ing carried out to ascertain the rations that will economically give the heaviest yield of top quality



T s Refrigerator Trailer is one unit of a fleet of 9 Fruehauf Trailers operated by the Belle Isle Creamery Company of Detroit

WHY BUILD BRANCHES?

WELL-KNOWN Milk Dealers all over America are using Fruehauf Refrigerator Trailers in place of costly branch buildings. Their experiences are guide posts that point the way to huge savings for you.

Practical and Profitable

Branches maintained at various points throughout your territory mean heavy investment in modern refrigerator equipment—and substantial costs for handling and supervision.

Fruehauf Refrigerator Trailers are storage-plants-on-wheels. They can be "spotted" each night in your branch locations. Then, early in the morning, the neighborhood delivery wagons can be loaded directly from the Trailers—saving extra handling and the investment required for permanent plants. Trailer haulage costs, too, will show a great decrease in costs as compared with motor truck transportation.

Do You Want Figures?

Are you ready to consider figures that support the above statements? Impartial surveys by a neutral engineering firm are now available—giving detailed facts about the low-cost haulage performance of Fruehauf Refrigerator Trailers and Tank Trailers. We'll place these figures before you without obligating you in any way. Write us.

The City of Birmingham's Milk Supply

What Has Been Accomplished in the Alabama Metropolis in a Very Few Years. Adulteration of Milk Has Been Eliminated and Typhoid Death Rate Greatly Reduced

By L. C. BULMER, B. S.*

THE history of Birmingham's milk supply is probably unique among cities of this country, in that within a span of little more than five years this city has revolutionized its milk supply from what was generally regarded as the worst in America to what is now accepted, at least from a public health standpoint, to be one of the best regulated supplies.

Birmingham was allowed to grow to a population of 200,000 before any definite attempt was made to solve its milk problems. The city, even as late as 1920, was dependent upon the village type of supply. At that time about two hundred more or less backyard dairymen converged upon the city daily and peddled milk in its raw state, while two small concerns attempted to produce pasteurized milk, which product rapidly grew into disrepute, due to inexperience on the part of the persons engaged in the enterprise and lack of official control by the department of health.

In 1921 Birmingham gained considerable noteriety from the fact that official investigation revealed that, in comparison with its population, this city consumed less milk than any city of which statistics were available. Theconsumption of milk was less than one-fifth of a pint per capita.

Evidence at that time pointed clealy to the fact that the public were wholesomely afraid to drink milk. This was scarcely to be wondered at in the face of milk-borne epidemics, one of which it was estimated caused over seven hundred cases of typhoid fever and more than one hundred deaths as a result of an infected raw milk supply from one dairy. Birmingham had the highest death rate in America, both for typhoid fever and colitis of children under two years of age who depend on milk for sustenance. Available statistics show that 53 per cent of the city milk supply was adulterated to the extent of approximately 10 per cent added water; the average bacterial count of all samples analyzed for three years prior to 1921 exceeded 780,000 per cubic centimeter; while those who recall the conditions at that time will testify that it was almost impossible to buy a bottle of milk that had no visible signs of sediment, and that the average milk would not keep twelve hours with ordinary care after it reached the hands of the consumer.

It was such facts that the health officer, Dr. J. D. Dowling, presented to the city government in 1921, when the present milk code was adopted and an appropriation of over $30,000 a year for milk control was sought. He pointed out that the citizens of Birmingham were spending approximately $94,000 a year on water added to their milk supply and with an appropriation of one-third that amount for milk control purposes he pledged the elimination of adulteration, in addition to insuring clean milk. The appropriation was approved, both as a public health measure and as a sound business proposition.

Today the division of food and dairy inspection of the department of health comprises a personnel of seventeen persons. All dairy inspectors on the staff are required to be graduates of recognized agricultural colleges and specalists in dairy husbandry or manufa The policy of the department of health in dealin its milk problem has been along educational lines than following the rigid system of enforcement o requirements. Education has been extended to th lic and to the dairymen. An endeavor has been to carefully mould public opinion on the milk qu and to aid dairymen by advice on both milk hygie dairy husbandry. It is recognized that unless th business is on a profitable basis reform cannot be for. The department of health, therefore, has exp much time on education talks, furnishing service preparation of plans for sanitary dairy building ing advice on all matters pertaining to dairy husb and affording free laboratory service to determi creased efficiency. Frequently as many as one hu samples a day are submitted to the department of laboratories for complete bacterial and chemical a for which a commercial laboratory would charge $4 to $6 per sample.

Such a policy, while exceeding that of the a department of health, has proven highly fertile following facts show: During the past five years has been 30 per cent increase in population, while the same period there has been over 100 per cent in in milk consumption and slightly more than 100 pe increase in cow population from sources of supply have actually decreased largely in numbers due t sons withdrawing from business who are unprepa comply with proper sanitary requirements. The ty death rate has decreased from 65 to less than eight the death rate from colitis of children under two of age has decreased from 182 to 33. The averag terial count of market milk has decreased from o ceeding 780,000 to one well below 50,000 per cubic meter. Adulteration has been practically elimi The consumption of pasteurized milk has increased almost nil to over 45 per cent.

It is true that Birmingham consumes only two- the milk consumption per capita of the average ci the use of pasteurized milk is relatively small. fact is, that it is impossible to rectify condition night which have existed for half a century. (definite program, education and patience will do together with co-operation and enterprise on th of the dairy interests.

The department of health, however, has blaz trail in no unmistakable manner. It behooves the interests who, heretofore, have depended almost on the department of health, to become more active coming to Birmingham of Southern Dairies and it struction of one of the most modern plants in the under competent management, is a great asset i respect. The recent introduction and re-organizat other plants, and the better spirit of co-operation fested between all milk interests, is also notew and lends promise to greater progress.

In all, it is felt that progress from now on w pend largely on commercial enterprise. With the growth of this city much of the burden will be

CLEVELAND BOTTLE WASHER

MR. OLDHAM of the Phenix Dairy, Houston, Texas, after having carefully studied all makes of bottle washers for more than three years, decided on the **CLEVELAND** for his new plant, which is one of the largest and most up-to-date in the South.

He was thoroughly convinced that the **Cleveland Method of Pressure and Dormant Soaking in Conjunction with Clean and Sterile Brushes** would give him the cleanest and most sterile bottles to match his unexcelled product. Furthermore he knew that the Cleveland Bottle Washer was the machine for service due to its rugged construction and simplified design and this has been conclusively proven by the fact that **The Phenix Dairy erected and put their bottle washer into operation themselves without the assistance of any representative of the Union Engineering Co.**

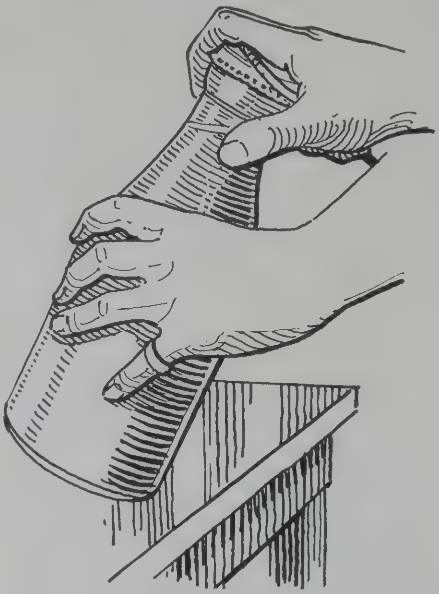
THE
DACRO
METAL CAP

Here at last is the perfect package of Milk or Cream, pure and sweet pasteurized IN the bottle! Made possible by a mechanically perfect closure.



Pure, sweet MILK—delivered under hermetic seal to the home. Handy openers supplied at small cost.

The Dacro Metal Crown—This remarkable cap is made on exactly the same principle as the famous Crown Cork which revolutionized the bottled beverage industry. The Dacro Crown is a hermetic seal. It automatically locks under the glass rim of the bottle. It is scientifically a perfect closure. Sealed with the Dacro Crown, Milk or Cream can be pasteurized in the bottle, an exclusive advantage of this seal. The Dacro Crown covers and protects the pouring lip. It KEEPS clean milk clean! No danger of contamination or tampering with pure contents. And the Dacro Crown can be replaced for temporary covering and seal after opening bottle.

Tycos Recorders on Storage Tanks

Here are twelve *Tycos* mercury actuated temperature recorders installed on the storage tanks of a large Eastern manufacturing company.

They keep faithful record of every fluctuation in the temperature of the stored milk. After long periods of use they check accurately with test thermometers when they are inspected. They are rendering the *Tycos* service which we built into them and which by experience milk dealers and superintendents have grown to depend on.

If you plan additions to your temperature equipment, be sure to send for *Tycos* Catalog Part 500-A for milk plants. In it you will find a *Tycos* or Taylor temperature instrument for every milk plant need.

Use of Motor Driven Vehicles Milk Deliveri

BORDEN'S
BOTTLED
MILK & CREAM

By F. A. WEBB*

THE milk industry has looked upon the problem of distribution only in the light of transportation of our products from receiving stations in the country to pasteurizing plants and to branch distributing points, and has worked out economical means of transportation by the use of tank cars, tank trucks and trailers. The economies effected have been due to the increase of volume, one large tank for many cans, one unit for many.

The same principle has been applied in the use of trailers, increasing the quantity of goods handled.

Another application of the same principle was made when the gas car was used to increase the radius of operation on account of the limitations of the horse. Adding new territory and business, thereby increasing the volume of the plant.

In the natural course of events, the milkman (like Savonoralla traveling the universe in search of diamonds, finds them in his own back yard) at last has attacked the problem nearest to him—the final step in the distribution of his goods to the consumer.

The horse has been the only motive power used in this last step of distribution, and rightly so because the work as planned on account of distances traveled, rest periods, and his intelligence is found to be at his most efficient basis of work.

The problem presented is to find something that will enable us to distribute more goods with better satisfaction at lower cost. This is certainly a worthy undertaking. With that end in view, the Borden's Farm Products Company of Illinois undertook to study the problem. We found the electric truck people ready to present their claim as having the substitute for the horse that would accomplish these objectives.

Enough cannot be said of the company and the salesman who assisted in making the surveys and preparation of reports. It is the type of salesmanship that is ever alert to get at the facts and assist in making the correct application of them. This was done at heavy expense to the company, and is greatly appreciated.

A small branch was selected which we thought, on account of its location and the exclusiveness of its people, electric transportation would work out economically and appeal to them from the standpoint of appearance and noiselessness, etc.

The first step was to find out what we were doing with horses. We collected this information on each route. In making the time study, we found the driving time from distributing station to the first customer was 31 minutes; serving time on the route, 4 hours, 40 minutes; driving time from last customer to station, 34 minutes; mileage to first customer, 2.7 miles; from last stop to distributing station, 3.1 miles; mileage from firs tomer to last customer, 4.9. Total mileage—10.7 Total stops of vehicle, 77.6, together with a mass formation not pertinent to this discussion.

After completing this survey, the electric truck p demonstrated they could make the deliveries and 30 minutes on actual serving time and approxim 30 minutes in time going to and from route. We found by taking advantage of the time saved in se we could eliminate five routes which increased the age per route, 25 points per day, giving the salesma benefit of time saved going to and from the route.

The question of the kind of body to be used h be settled. A careful analysis of the work to be compelled us to overrule custom and the idea of s ardization and adopt the drop frame.

Having agreed on the advantages of electrifyin the type of body, we still had to make a decision the type of battery. Electric truck people, if you ha had the experience, are inclined to leave the sele of batteries up to the purchaser. So we set out t the battery best adapted to our use, and strange t all the different battery concerns have staunch sup ers. I suppose it's the same old story that each c had to justify his purchase. After carefully wei the information, we disposed of the battery questio

You will note I have refrained from mentioning n of concerns. This is done in the spirit of fairne truck manufacturers and battery people.

As stated before, our problem is to distribute goods with better satisfaction at less cost. Acco to our survey, the mileage on routes was 4.9 mil 25,872 feet. There were 77 stops of the vehicle average distance between stops was 336 feet. N casual observation of a street car will show quickly and easily it gets under way, compared w horse. An electric truck will be traveling at the of 10 miles an hour in covering a distance of twic length. In some cases the route men will use som the time saved in going to and from the route, so if the time is saved, the salesman can make even deliveries.

Another help in saving of time is the drop frame this survey, the salesman left and returned to the ve 77 times. With the drop frame, he saved 154 climbing up and down, which is enough time and en to climb to the top of a 10-story building. Of co this doesn't mean much, but the few seconds here there count. Therefore, because you can save time, t by increasing the unit volume, the electric shoul place the horse.

Herbert Hoover says an increased standard of li for the whole nation depends upon the maximum vidual production within the proper limits of the hu

[*The use of gelatine in buttermilk will build more sales for you*]

Gelatine in Buttermilk

Is Approved by Dairy Industry Experts

BECAUSE:

1. It checks "wheying off"
2. Improves taste and texture
3. Retards development of acidity
4. Increases food value and digestibility
5. Is successful in both natural churn and commercial buttermilk
6. Costs less than 1 cent per gallon
7. Does not change the manufacturing process

total mileage was over 30 miles, and they came in with no trouble, which is further evidence that the electrics should have been able to make the rounds without difficulty.

Now, I believe we have established the fact that more goods can be delivered and with better satisfaction.

We have been operating these trucks about a year. The question of cost cannot be definitely determined at this time, as certain fixed charges such as depreciation on batteries and trucks have been based on the experiences of users in other lines of industry. We expect to get longer life from batteries because of the variation of current consumption required on different routes. When a battery can no longer handle a twenty mile route, it can be placed on a 15, 10 or 5 mile route. In this way, we will be able to get the maximum life of the battery.

Batteries are depreciated at the rate of 25 per cent, and trucks at 10 per cent per year. We expect trucks to be in service longer than 10 years. In fact, our investigation made at the beginning of the study, disclosed the fact that it was not uncommon to find trucks that had been 12 to 14 years in service with no appearance of wear, and no thought on the part of the owner to discard them.

We found that the fixed charges over a nine month period for 1926, when electric trucks were used, showed an increase over corresponding periods when horses were used, but the savings effected in the controllable expense more than made up for the increase in the cost of fixed charges, and showed a distinct saving on the whole.

Then again, if we had taken advantage of the consolidation of 2 or more branches disposing of those properties and relocated in a garage type building, we could have materially decreased the cost of fixed charges and controllable expense and had the advantages that accrue to increased volume.

While this discussion has been confined to a comparison of horse cost with electric truck cost, statistics prove that gas truck costs are higher than electric truck costs, and should not be used on frequent stop work. It is probable that gas trucks can be used to further extend your territory even beyond the possibilities of an electric truck, but for frequent stop work, the electric is more economical than a gas car.

Consider the number of movements saved by a driver of an electric over the period of a year. It is estimated it would be over 100,000. This means energy conserved and energy is the measure of results obtained. Then again, frequent starting and stopping of a gas motor adds to wear and tear and shortens the life; at the same time, if the motor is running, it is consuming oil and gas. On frequent stop work, gas and oil consumption is increased 3 or 4 times. Not so, with an electric. Several milkmen have recently purchased electric trucks for milk distribution, and are experimenting with them.

Ice cream companies years ago, went into electric transportation quite extensively.

Mr. Robert E. M. Cowie, President of the American Railway Express Company, addressing the National Electric Light Association at Atlantic City in 1924, on the subject, "WHY THE AMERICAN RAILWAY EXPRESS COMPANY USES IN EXCESS OF 1800 ELECTRIC VEHICLES," gave the following 15 reasons:

1. Reduce cost.
2. Fastest trucks there are on short haul or frequent stop work.
3. Its simplicity makes it easy to run and easy to repair.
4. Rugged, reliable, seldom breaks down on the road; disabled more infrequently than any other type of truck.
5. Electric trucks last longer than gas truc
6. Electric trucks are clean.
7. Electric trucks are quiet.
8. Electric trucks are odorless.
9. It can be stored at loading platforms, garage space.
10. It uses power with minimum waste.
11. Speed that is consistent with prudence running and power economy.
12. Employers' control of speed is inheren truck.
13. Its tractive power is greatest in proportic horse power used.
14. Its hazard of fire, accidents and theft is
15. It costs less to run and maintain.

The American Express Company's business is cent transportation. They sell service. Each is zoned or routed the same as in the milk busin packages of all sizes and dimensions called for livered in that zone.

We know that many of the best known bus stitutions of the country use electric trucks, such Wanamaker, Ward Baking Company, American Express Company, Tiffany and Company, H Hardart, Marshall Field and Company, and man This equipment having been in service over a years, such eminent authorities as Thomas A. Ed the late Charles P. Steinmetz declare the electri are superior for ordinary deliveries where sh and frequent stop work is involved.

In the September issue of "The Power Frank H. Williams of the Los Angeles Creame pany, says that they have been operating electri since 1911; his reasons for their use are—first costs one-third less per year per car to operate tric truck on short hauls and frequent stops tha to use gas trucks.

2. It is much easier for the driver to handl trucks on such routes than gas cars.

3. Easier to break in "green" men on elect gas trucks, because of simpler operation.

4. Slow speed of the electric cuts down the of wrecks.

5. The drivers on their short hauls and stop routes prefer electrics to gas cars because the constant pedal manipulation necessary on g no cranking, etc.

6. Lack of complaints from customers wher trucks are used for night deliveries on accour lack of noise.

7. Smooth running, which means less shakin the milk and cream and other products delivere truck.

In summing up, we have demonstrated tha deliver more goods with greater satisfaction to and our customers and for the short period months, at less cost, and it is the statement of ma concerns who have operated electrics over long on short hauls and frequent stop work, that th less than with horses and wagons or gas trucks

We believe we have been justified in recom to our company the investment of capital nec make the installation of electric trucks possible

Best we have had"—this user writes

IN recent years, dairies in all parts of the country have tested Pure Nickel equipment in day-to-day service. Without exception, they have found that this attractive, silvery metal furnishes advantages that can be secured in no other material.

They have found, for instance, that Pure Nickel equipment helps to lower the bacteria count—that it facilitates the production of better, cleaner milk. They have also found that it is more economical because of its greater strength and toughness. It stands up for years in the hardest service.

The opinion of Hutts' Dairy is typical of that expressed by dairy owners everywhere. Mr. H. R. Hutt writes: "....... we are operating a milk distributing plant and find our Burrell Nickel Spray Vat pasteurizers the best we have had. The Nickel is easy to keep clean and always looks bright."

If you have any doubts concerning the advisability of using Pure Nickel equipment, we suggest that you consult your regular manufacturer. Additional information about Pure Nickel may also be secured direct from us.

not make the change, because of the question—will it pay?

Distributors in other lines have made the change, possibly not to the extent of 100 per cent, and contend they do not regret having done so.

There is only one way to find out if it will pay and that is by the actual operation of electric trucks, the expenses of operation being carefully classified and properly accounted for, and comparison made with expenses of operating with the horse-drawn vehicles.

The subject assigned to me for discussion is "Ascertaining Motor Vehicle Delivery Expenses." However, the problem before us is "The Accounting Procedure to be followed in ascertaining the Expenses of Operating Electric Trucks and in comparing them with the Expenses incident to the Operation of Horse-Drawn Vehicles."

This comparison is not made between electric trucks and gasoline trucks for the reason that the electric truck will in most instances replace the horse-drawn vehicle rather than the gasoline truck.

My address will therefore deal with the accounting procedure to be followed in ascertaining the expenses in operating electric trucks and with the comparison of these expenses with the expense of operating horse-drawn vehicles.

While the accounting procedure takes in not only a correct classification of accounts, but also covers the flow of business transactions over the books of record, in order not to take up your time with a subject with which you are all more or less familiar, by this I mean the details of accounting procedure, I will confine my paper to the classification of accounts which I believe to be the most important.

Amongst the larger companies where there are a number of distributing branches, and individual route costs are not maintained, the ideal method would be a complete installation at any one distributing branch, where certain results of operating electrics could be compared with the previous results of operating with horse-drawn vehicles. With the smaller companies, meaning those companies who maintain but one distributing branch, this would not be feasible, but in the latter instance, individual route costs would be necessary. These could be kept very handily, charging each route with its direct charges and spreading overhead items on a basis of routes or points sold.

In setting up a series of accounts, I have grouped them under three classifications, namely:

Controllable Expenses
Fixed Charges
General Expenses

Under the Controllable Expense classification are those expenses which are more or less controllable, and in which an increase or decrease might occur by reason of the installation of electric trucks.

Fixed Charges are non-controllable expenses, which also might increase or decrease through the installation of electrics.

General Expenses are the controllable or non-controllable expenses, whose increase or decrease would not be affected through the installation of electric trucks.

While these classifications are set primarily for the use of the larger dealer, the same type of classifications could be used by the smaller dealer; in fact, the smaller dealer could go into greater detail.

CONTROLLABLE EXPENSES:

Electric truck would compare with **Horse-drawn**

Salaries and wages:	Salaries and wages
Milk room and platform men	Milk room and pl men
Garagemen	Stablemen and ba
Senior and junior foremen	Senior and junio men

Commissions	Commissions
Watchmen, etc.	Watchmen, etc.
Repairs and supplies	Repairs and supplie
Charging batteries	Feed and bedding
Water	Horse shoeing
Ice used	Veterinarian
	Water
	Ice used

In a comparison of controllable expenses, the e truck in early years would probably show a co able saving, which would be due principally to t creased wages of foremen and route salesmen— creased wages is meant rather the elimination of —on the theory that a greater volume could be h via the electric as compared with the horse-dra hicle, and the elimination of the expense of maint the horses which, according to our experience, i than double the cost of current used in ch electrics.

In view of the fact that management looks u sults as a guide to help him in deciding future p extreme care should be exercised by the account submitting figures of this nature, that facts, not re in his figures, are brought out. For instance: electrics have only been in use for a period of les a year, the repair and upkeep charges may be co tively small, where on the other hand, the repa keep and painting charges on the horse-drawn may be extremely heavy in the period under co son, and unless this fact was brought to the att of management, he would have a distorted pict what has happened. For purposes of comparison tail analysis of expenses in both periods should be and a complete picture submitted, taking into cons tion increase in sales, changes in wage scale, etc.

FIXED CHARGES:

Electric truck would compare with **horse-drawn**

building, if one is built with the idea of using electrics instead of the horse-drawn vehicle. By the type of building, I refer to the wooden construction necessary in stables, etc., as compared to the fire-proof construction of buildings of the garage type.

Depreciation is a very big factor in the elements of cost of operating with electrics. While from the experience of actual users, the life of the electric truck has been found to be considerably in excess of ten years, some as high as fifteen years, and the trucks still running, we should be very careful to correctly set up what in our opinion would be the life of the electric truck, based upon the conditions under which we must operate them, since the users of electrics in other industries usually are carriers of dry merchandise, and while their trucks may be put to as much use as those in our particular line, they are not carrying the same commodities. Therefore, until we learn from actual experience, the ten-year period would be a conservative estimate.

There are various opinions as to how depreciation should be applied, the simpler way is, of course, the fixed rate which is used more or less by the larger companies, but possibly for the smaller companies depreciation on a declining value may work out more satisfactorily. For instance: on the theory that as the truck becomes older, it will require heavier expenditures for repairs and upkeep, there could be put in use a graduated rate of depreciation, starting with a higher rate and working downward, or depreciating at a fixed rate on the depreciated value, which would mean that when the repairs are higher, the depreciation would be lower. This would also leave some value to the truck against which the salvage or turn-in value could be applied.

The type of batteries being used in our service are guaranteed by the manufacturer to give a life of 40 months, and although the experience of actual users of similar type batteries has been as high as 60 months, we believe a conservative estimate to be about 48 months, and in depreciating batteries, we do so on the replacement value, which is considerably less than the list price, due to the salvage allowance on the old battery. This estimate of 48 months of course should be changed to what actual experience teaches us is a more correct life.

General Expenses:

Under the classification of general expenses would go such branch expense items as:

Salaries and wages:
  Superintendents
  Office employees
Lighting
Stationery, postage and telephone
Hauling
Fuel
Building repairs
Reserve for bad debts
Miscellaneous expenses

The installation of electric trucks having no bearing on the increase or decrease of these expenses, no consideration need be given to such increase or decrease in the comparison of expenses.

Naturally, one of the most important problems in the installation of electric trucks is the question of invested capital. While it is true that the conversion of a distributing branch from horse-drawn equipment to that of electric truck equipment is an undertaking that any company might well hesitate to make, if it were a question of the building of a new branch, the decreased investment in the construction of a garage, as compared to barns, stables, etc., would tend to offset part, if not all, of the increase in investment, due to the installation of electric trucks as compared to horse-drawn equipment.

Gentlemen: In my introduction I have raised the question—Would it pay to substitute the electric tr
the horse-drawn vehicle?

We, as milk dealers, have operated few electr
a period of two years, and have had one bran
pletely electrified for one year, the operating re
which would warrant our answering this questio
affirmative.

We are, of course, not in a position to state f
own experience what the operating figures wi
over a period of years. However, there are m
liable fleet users of electric trucks in other lines
ness whose experience seemingly justify the use

Mr. Webb, in his paper, has pointed out to y
through the installation of the electric truck, v
accomplished the following:

1. We can handle a larger load.
2. We can save time and render our servi
   greater efficiency.
3. There will be a savings in wages paid rou
   men.
4. We can operate them at less cost.

Also, he has pointed out to you that they a
sanitary, that they can be operated with less n
they enable us to render a more satisfactory serv
the standpoint of our customers and ourselves.

In my paper, I have pointed out to you:

1. The fixed charges for electric trucks
   heavier than for horse-drawn vehicles be
   the greater charge for depreciation, due
   larger investment.
2. The controllable expenses for electric tru
   be less than for horse-drawn vehicles.
3. Changes in general expenses need not
   sidered.
4. (a) In the earlier stages of the installa
   electrics, the capital investment will b
   greater than that necessary with hors
   vehicles.
   (b) However, in the later stages of the
   tion of electric trucks, when the conversi
   horse-drawn vehicles to electrics has beer
   completed, the decreased investment, be
   the nature of buildings required, will in
   not fully, offset the increased capital inv
   electric trucks as compared to horse-dr
   hicles. Bear in mind, however, that thi
   only capital invested, and would not of
   additional depreciation on the electrics.

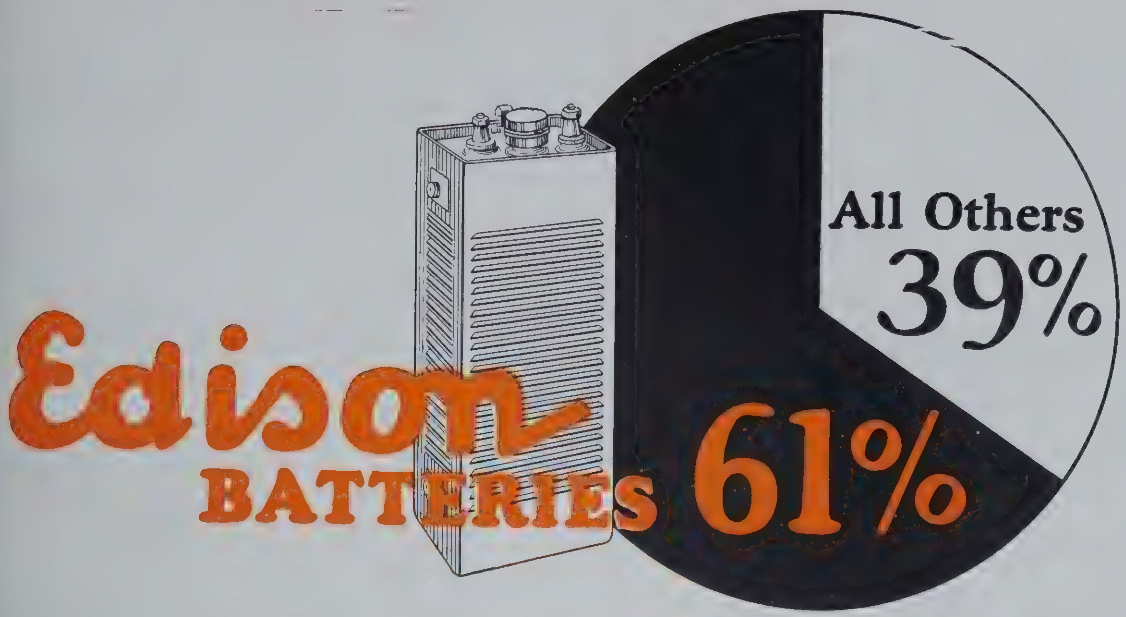
was conceived almost forty years ago.



EDISON serves the users of more than 61 per cent (nearly two-thirds) of all motive power battery equipment—industrial trucks, street trucks and mine locomotives—because Edison serves best at the lowest cost.

No less potent reason could have brought about this unquestioned leadership in the relatively short period of nineteen years since Mr. Edison first placed the Edison nickel-iron-alkaline Battery on the market.

The Edison Battery is *not an adaptation* of old principles to new uses, but *a new battery,* operating on a new electro-chemical principle, made of new materials, differing in construction and designed specifically for motive power service. The Edison Storage Battery is today specified by the majority of large users of industrial batteries because engineering surveys and comparative operating cost records invariably prove that Edisons haul more for less cost.

World's Dairy Congress Official Liner—S. S. Leviathan

World's Dairy Congress Tour

to Europe in 1928

A VACATION abroad with the wife and family on the greatest ocean liner of the seven seas! Now your dream can be realized; for next year in June, Dairy Products Manufacturers from every part of the United States and Canada are going to Europe to attend the World's Dairy Congress in London.

At this monster convention, the biggest of its kind in the history of Dairying, there will be delegates and representatives from the Dairy Products Industries of practically every civilized nation in the world. And after the convention, there lies before you the wonderful vista of quaint European cities and towns, travels and sights that will live forever in your memory.

The S. S. Leviathan, the largest and most luxurious steamship afloat, has been selected for this memorable trip. From stem to stern it measures 950.7 feet—width 100 ft. 6 inches—59956.65 tons.

Staterooms, social halls, dressing rooms, smoking rooms, libraries, music rooms, dining rooms, tea rooms, gymnasiums, swimming pool, and baths all represent a supreme triumph in ship building and ship decoration.

Forego your vacation this year, if necessary, to take in this great European Trip. Write for reservation blank which gives full information to **THE OLSEN PUBLISHING COMPANY, 501-515 Cherry Street, Milwaukee, Wis.**

Watch the Belting!

Can Be a Source of Great Expense, Inconvenience and Losses if Proper Precautions are Not Taken and Care Exercised in Buying

IT HAS been said that "anybody's job is nobody's job." Perhaps there is nothing in the creamery in which this is more applicable than the belting used to drive the various machinery and equipment. For, while it is true that belting plays a very important part in the operation of a butter plant and is, undoubtedly, a considerable expense, it is a peculiar fact that very little attention is paid to the upkeep and selection of belting in the majority of plants.

To the average creamery operator, a belt is nothing more or less than something to drive his machinery and equipment. If it wears out (which it does at frequent intervals when so little care is paid to it) there is but one thing to do and that is to order another one. Usually, when they are ordered they are selected without giving a great deal of thought to it and in the most haphazard manner.

Still the average creameryman knows that belting is of tremendous importance to him, from the standpoint that it can cause him serious inconvenience and in some cases loss of time, labor and material. Too often a belt will break or because of excess slipping a churn of half-churned cream will have to rest until the slack is taken up or the belt repaired. Again it frequently happens that the same thing occurs on a vat of cream being pasteurized. In some cases it is excusable, of course, but in a great number this difficulty could be overcome by the proper care and selection of the belting.

Not only is there a great possibility of loss from these sources, but there is in very many cases a loss of horsepower due to excess slippage of the belt. This is particularly true in the case of the larger machines, such as refrigerating machines, churns, pumps, etc. Of course it will be pointed out by some that this is almost a negligible factor, but when it is considered that this loss is incurred month after month it can run into a considerable figure.

Selection is Important.

Of course, the first consideration of importance is the selection of the belt. It is quite well known that it often takes an experienced beltman to select belting of the best quality, and that the inexperienced man has nothing in the form of rules on which to base his selection. This is undeniably true, but there are some considerations which should be taken into account in the purchase of belting. Among other conditions accounting for the difference in belting are the hides from which they are made. It is a known fact that belting selected from the hides taken off the animal during the summer are the best suited, due entirely to the fact that the animals are in the best condition and cleanest during this season. Of course, it is to be admitted that the creameryman can hardly be in a position to know when the animal was killed when he is selecting the belting, but he can at least specify that he wants the belting selected from summer hides.

Perhaps the surest way of obtaining a high grade belt is to pay the price. Belting, like any other article, has certain definable grades, and in order to secure the highest quality it is necessary to pay for quality. This rule applies to belting as well as to the cream he buys.
Unfortunately, it is too often the case that a be
belt to most creamery operators, and price does not
into their selection. If they would but consult
records and add up their belting expenditures
would, undoubtedly, see the folly of buying o
basis. Belt manufacturers are no different fro
others in the commercial world. For, they wil
the buyer exactly what he wants for the money t
pays.

Use of Piping Test.

Aside from the price factor there are some
that can be followed out in the selection of the
grades of belting. One test that is most generally
and has limited qualities is known as the "piping"
It simply consists of taking a piece of belting and
ling it up, grain side in. If the wrinkles, or pipin
pearing on the grain side of the leather are lar
course, the leather is not of high quality. Better
ity of belting shows delicate wrinkles which are f
texture and indicate firm, sound leather.

Another thing that is very important in the
tion is the detection of mixed qualities of leather
might be used in the finished belt. Generally, it
possible for anyone but one knowing belts very w
detect this, but, in general, coarse, parallel wri
denote shoulder strips whether running lengthwi
across the end of the belting strip. If running le
wise the wrinkles denote that shoulder strips have
used. If the wrinkles running crosswise are dee
pronounced, belting strips which are too long have
used which necessitated cutting into the shoulder.

Of particular importance to the creameryman
secure a belt that is waterproof. Necessarily, be
of the extreme moist condition found in butter n
facturing plants it is to the manufacturer's intere
secure a belt that will resist moisture. The reaso
this is totally unnecessary to explain, for it is a
known fact that belting that is not waterproof wil
in a very short time, or will show excess sag and
page. Waterproof belts can be secured, for they
and have been on the market for some time.

Buy On Thickness Standard.

Belting is purchased on many different stand
but perhaps the most commonly used are the stand
of weight and thickness. Many manufacturers
that the best policy is to buy on thickness, inasmuc
some belting is known to be "weighted," and for
reason the thickness basis is the most satisfactory.

Those creameries buying a considerable amoun
belting at one time should also buy on the basis of
sile strength. All belting should have a minimum te
strength of 3,000 pounds per square inch and an ave
of approximately 3,750 pounds per square inch. Bel
should be selected at random using five test speci
when making the test.

It is a well known fact that different belts ha
greater or less tendency to slippage, and this is a
important factor in the proper selection of belting.
ally a highly polished belt, that is hard rolled, sho
low coefficient of friction and, therefore, will slip
readily and will be a poor transmitter of power, w

IT'S HIGH TIM

A Message to The Dairy Indus

FOR months past reports have been drifting in f
our friends in the dairy industry that certain run
were afloat about Rice and Adams—unpleasant
of gossip that were totally unsupported by f
Apparently the death of Mr. Chas. Adams and his
and the subsequent reorganization which was required,
sented a choice opportunity to attack a strong competito

At first, because Rice and Adams has always operated o
basis of clean competition, these reports were greatly
counted. It seemed inconceivable that anyone would st
to tactics so unethical and we supposed that the fabricati
soon would die a natural death.

Now, however, the day has come to assert ourselves. It's h
time the truth were told, and the following statements will
at rest any doubts which may have assailed you:

Rice and Adams was never in a stronger position than i
today. The death of the senior Mr. Adams and his son na
rally required readjustments of personnel and stock, but th
ideal of service and quality are permanent possessions wh
will always be found reflected in every R & A machine.

SINCE 1895—AMERICA'S FINEST DAIRY EQUIPMEN

The R & A Threeway

Utilizes a highly efficient combination of Soaking, Hydro and Brush methods of washing. Also furnished without brushes if desired. Built in all standard capacities.

The R & A Rotary Can Wash

Three different models, 1 hand feed, 2 power
Capacities 2—8 cans per minute. Ask for literature.

Milk COOLERS

U-K Direct Expansion Sections utilize the Ammonia Gas direct from the refrigerating machine. They require no brine, brine-tank, or pump. This saves installation and maintenance expense of a pump and brine-tank.

U-K Coolers cool the milk faster and prevent any further growth of bacteria in the milk after the pasteurization process.

A nickel silver tube drawn over the two inch steel tube reduces frost to a minimum, eliminates rust and wear entirely, and makes the U-K Direct Expansion Coolers last indefinitely. The U-shaped ends and center supporting yokes are heavy brass castings. All joints are so welded and guaranteed against leakage.

coefficient of friction. Again, a belt that is well worn shows a higher coefficient of friction than a new one, or in other words the efficiency of the belt increases with age, providing, of course, that it is not too aged so that there is excessive breakage. It is unquestionably best in purchasing belting that a soft, pliable belt should be selected, for a stiff belt will not transmit the maximum amount of power and will crack quite readily.

Belting of the better quality is usually pliable and although it will show some stretch, it is usually elastic enough to avoid breaking the fibers of the leather and destroying the life of the belt.

There are some who place much stress on the straightness of the belts to gauge their possibility of running straight on the pulleys. In the case of double belts, this is, perhaps, a good rule to follow; for by the nature of their construction a double belt, if properly made, will lay straight on the floor. However, this is not the case with single belts, for a well made single belt will have a gradual sweeping curve to it when laid on the floor, but will, nevertheless, run straight on the pulley.

Types of Drives.

Because of the machines used in the butter industry, there are, of necessity, many different types of drives used. In general it can be said that the ideal drive is the horizontal drive with the slack of the belt on top, but, inasmuch as this drive cannot be adapted to all conditions in the creamery, its use is not always possible. In those cases where it becomes necessary to have the slack of the belt on the bottom it is advisable to use a belt at least 10 per cent wider than would be used in case of where the slack is on the top. Another form of drive that is frequently used is the cross-belt drive. Usually, it is inadvisable to use this type of drive or belt greater than 10 inches in width.

In many plants a fixed binder is employed on the drive. Usually, it is found on such machines as ice machines and other heavy machinery. According to the best authorities the fixed binder should not be used whenever it is possible to eliminate it, inasmuch as it imposes hardship on the belt and is of no particular value, other than when used as a device to clear beams or other obstructions.

In installing the belt it is quite a safe rule to install the belt at a tension which will carry the load easily without straining. In other words, they should be just as slack as possible without incurring slipping. Belts should never be absolutely tight, and if it is found that this becomes necessary in order to pull the load it is an almost sure indication that there is something amiss with the drive. Single belts should be put on to run with the grain side next to the pulley, and in such a manner that the point of the laps will run against the pulleys in order to minimize the possibility of the laps on the outside of the belt coming apart. Double belts should be put on so that the point of the laps will run with the pulley. It has been found that the grain side of the belting possesses greater driving qualities than the flesh side of the leather. This is not a factor that should be overlooked or taken lightly, for tests show that when the grain side of the leather is toward the pulley it has the power of pulling a load from 20 to 40 per cent greater than the flesh side, which shows a great tendency to slip under a load. It is true that when the smooth side is run against the pulleys that the belt is broken in easier and it pulls fairly well as soon as it is placed on the drive. However, after the grain side has been broken in it shows far greater efficiency than when the flesh side is toward the pulleys, and while the grain side improves in transmitting quantities with flesh side does the reverse.

Have a Beltman.

Unquestionably, the wisest policy is to have in the creamery look after the belts. For, to repea body's job is nobody's job," and if no one is d assigned to the task of caring for the belts it safe to assume that they will receive very little a Belts should receive regular periodic inspection inspecting the belts the following points should sidered: dryness, too oily or too heavily dressed, belts too slack or too tight, whether the belts ning true on the pulleys, and the general cond the belt and drive. It is far easier to correct these points in their beginning, than it is to ma eral repairs when a belt has been allowed to bec far gone. At the same time, it is safe to say tha siderable saving will be effected if regular atte paid to the belts, which will eliminate the possi frequent purchases of belts.

If a belt on inspection shows signs of openi certainly an unwise policy to try to repair the by driving a hand full of tacks, rivets or othe shifts into the leather. For, the leather will break within a short time, whereas, if it was p cared for the life would be materially lengthen

Another point of major consideration is the of a belt. When it is found that the belt is be dry, and shows a sign of cracking, it is an ind that the natural oil of the belt has been exhaust such cases, the belt should be carefully cleaned face dirt with a coarse piece of cloth. Kerosene used to wash the belt if it is necessary, and oft necessary to scrape the belt of such dirt. This accomplished by using a wooden block. In apply dressing to the belt it is always the best policy t little on the pulley side and more on the outside belt, but it should also be remembered that too dressing is as bad as a dry belt. In other word enough should be applied which will be readily ab by the belt and pulley side of the belt should greasy when the application is completed. This should be done when the belt is idle and there opportunity for it to remain so for several ho order to allow the dressing to soak in.

Not only is a dry belt a bad condition, but of importance is a greasy and oily belt. Grease a are very injurious to leather, and when a belt b soaked it is quite subject to rot. Oil and grease removed by applying gasoline to it from time t or, if the condition is not too serious, it is often p to remove the oil by packing it in dry materia as sawdust.

Often times the creamery operator is lost to what causes the many belting troubles which he ences. In general, the most frequent troubles ar ping, excessive stretch, running to one side of the weaving, cracking grain, and peeling grain.

Slip is usually caused by overloads, oily, oily surface, too much dressing or a dry belt surface cessive stretch is usually caused by overload, poo ing or damp conditions. Running to one side pulley is due to the pulley not being in alig Weaving is due to underload most generally, but also be due to overload. Cracking grain is caus overload, dry belt surface or excessive slipping. P grain can be caused by excessive slippage or the sticky surface dressings.

LITHIC MAN FIRST TO DISCOVER USE OF MILK IN HUMAN DIET.

Neolithic man, the man of the Stone Age, realized there was a property in milk which caused those drank it to become large and strong, but it re- ed for modern science to discover just what that rty is," said Sam H. Greene, secretary-manager of ornia Dairy Council, in speaking of the use of in the new dietary plan to fight pernicious anemia, by Dr. Karl Koessler of the University of Chicago. Neolithic man was the world's first herdsman, and vered the use of cow's milk in the human diet."

Centuries following the Stone Age," continued ne, "there lived in Egypt a great Pharoah, Men- ep, whose young queen, Aashait, was frail in health. her death he wanted to show his subjects that he aken good care of her, and had carved on the walls r tomb a cow being milked by one attendant and nilk being handed in a bowl to the queen by an- ."

Scientists have today proved, beyond the shadow doubt, that the fat soluble vitamines found in milk ote growth, form new blood, and prolong life. Dr. sler's experiments in treating pernicious anemia by se of milk, butter, cream, egg yolks, and tomatoes, rms the teaching of council nutrition specialists, advocate the use of at least four glasses of milk day."—California Dairy Council.

AIRYING OLDEST INDUSTRY IN CANADA.

airying is one of the oldest and one of the most rtant industries in Canada. It owes its modern de- ment and expansion to the introduction of the fac- system for the making of cheese and butter, to the tion of the centrifugal cream separator and to the ties afforded by improved methods of cold storage. first Canadian cheese factory was established in rio in 1864, and the first Canadian creamery for rmaking in Quebec in 1873. The first centrifugal n separator was imported from Denmark in 1882, he governmental organization of cold storage dates 1895.

he value of all dairy products in Canada in 1925 is ated at $241,069,320, distributed as follows: Cream- utter, 169,494,967 pounds, value, $63,008,907; dairy r (estimated) 100,000,000 pounds, value, $32,128,- factory cheese, 177,139,113 pounds, value, $36,571,- home-made cheese (estimated) 533,016 pounds, , $95,073; miscellaneous factory products, $16,882,- and milk consumed fresh or otherwise used (esti- d) 384,945,413 gallons, value, $92,383,048. The per a consumption of butter in Canada in 1925 has estimated at 27.36 pounds and the consumption of e at 3.26 pounds.

NSUMPTION OF MILK IN SAN FRANCISCO SHOWS BIG INCREASE.

he percentage of increase in the per capita con- tion of milk in San Francisco during March this is 50 per cent over that of the same month in 1922, ding to figures received by Sam H. Greene, secre- manager of California Dairy Council, from the u of dairy control and San Francisco department alth, co-operating.

he statistics show that during 1922 the people of Francisco consumed a daily average per capita of ints, while this year the daily average is .72 pints. San Francisco increase is twice as much as the rate in for the state, the report showing that the people lifornia drank 23 per cent more milk last year than did five years ago.

A Profitable Milk Grading Program

California Authority Gives Results of Ten Year Program. Great Advancement Made in Grading Milk and Working for Quality

By DR. M. E. McDONALD*

THE question of whether or not the grading of milk pays is still being debated in some quarters. In California this subject is no longer a question, inasmuch as the answer has been definitely and accurately determined to be in the affirmative, and the answer is based upon results of a ten year program, since the uniform grading of milk in this state was provided for in the Pure Milk Law in 1916.

The grading of a product is of necessity based upon definite standards. The standards adopted for the various grades of milk in California are outlined as follows:

Certified Milk is milk produced and handled in accordance with the rules of the American Association of Medical Milk Commissions and certified by a milk commission of a county medical society, the principal requirements of which are:

Cows shall be free from disease as determined by a physical examination once a month, and a tuberculin test every six months. There shall be not more than ten thousand bacteria per milliliter when delivered to the consumer. It shall contain an average of four per cent milk fat with a minimum of three and five-tenths per cent. To be cooled immediately and maintained at forty-five degrees F. Milk is to be bottled and sealed on the farm where it is produced.

Guaranteed Raw Milk is milk of a higher standard than that required for grade A raw. To be sold only on written approval of an inspecting department. The usual minimum requirements are as follows:

A physical examination of dairy cattle once every three months. Tuberculin test annually except where reactors are found, in which case it is repeated in six months. Dairy farm score of 85 per cent. Bacteria standard of 10,000 or 15,000 bacteria per milliliter when delivered to the consumer. Minimum butterfat content of three and eight-tenths per cent or four per cent. Cooled immediately to 45 degrees F. and so maintained. Bottled on the ranch where produced. The pouring lip of the bottle to be protected by a covering.

Provision has been made in the law for a guaranteed pasteurized milk, but as yet there is none on the market.

Grade A Raw is of a quality which requires a physical examination of cows every six months and a tuberculin test annually, where reactors are found the test is repeated in six months. Dairy farm score of not less than seventy per cent. Not more than 100,000 bacteria per milliliter when delivered to the consumer. When distributed twice daily it should be cooled to at least 60 degrees F. and so maintained; when not distributed twice daily it should be cooled to 55 degrees F. and held below 60 degrees until delivered to the consumer.

Grade A Pasteurized. Physical examination of dairy cows required every six months. Dairy farm score of not less than sixty per cent. The bacteria content before pasteurization shall not be more than 200,000; after pasteurization the bacteria content shall not be more than 15,000. Milk should be cooled immediately after pasteurization to 50 degrees F. and so maintained.

A standard has been provided for grade B pasteurized milk with the following requirements as a minimum: It must be obtained from cows in no wa
for the production of milk for use by man as dete
by a physical examination at least once in six
Before pasteurization shall contain not more than
000 bacteria per milliliter, and after pasteurizatio
contain not more than 50,000 bacteria per mi
There has been no milk of this grade on the Ca
market sold as retail milk for several years.

The grading of milk is permitted by law only
produced and distributed under the supervisio
local milk inspecting department operating as a
the local health department, which shall includ
organization at least one regularly licensed ph
and shall provide for field inspections of dairi
milk plants, veterinary inspection of all dairy cat
chemical and bacterial examination of the produc
local departments may grade their milk only af
proval of the state department of agriculture ha
obtained, and in order to secure this approval it is
sary that the local departments not only provide
service outlined above, but each branch of the wor
be conducted in such a manner as will meet w
state standard of efficiency, thus insuring unif
throughout the state.

The regulations under which an approved lo
partment operate are as follows:

Rule 1. Milk Inspecting Departments.

1. Every city, county, or city and county, d
approval of a milk inspecting department, shal
application for approval in writing to the depa
of agriculture of the state of California. Upon
of said application, the said department of agri
shall determine if such city, county, or city and
is entitled to approval. If such approval is giv
said department of agriculture shall issue a certifi
approval to the milk inspecting department, pr
such approval may be withdrawn should the m
specting department later become inefficient;
upon, the certificate of approval shall be forfeited.

2. To secure and hold such approval, a m
specting department must:

(a) Provide a sufficient force of qualified ins
and sufficient laboratory facilities to enfo
ficiently the "Pure Milk Law" and othe
and regulations relating to the grading o
and cream. In the absence of a laborato
rangements may be made with a person
approved by the department of agricult
the state of California to do bacteriologic
other laboratory work.

(b) Provide for the physical examination, by a
fied veterinarian, of all cattle producing
be sold within its jurisdiction at least once
six months. A clinical examination is not
sary; however, general physical examinati
manifest evidence of diseases such as en
glands, mastitis, pyometra, tuberculosis,
sores, ulcerated teeth, abscesses, etc., sh
conducted.

(c) Maintain the standards for the various gra

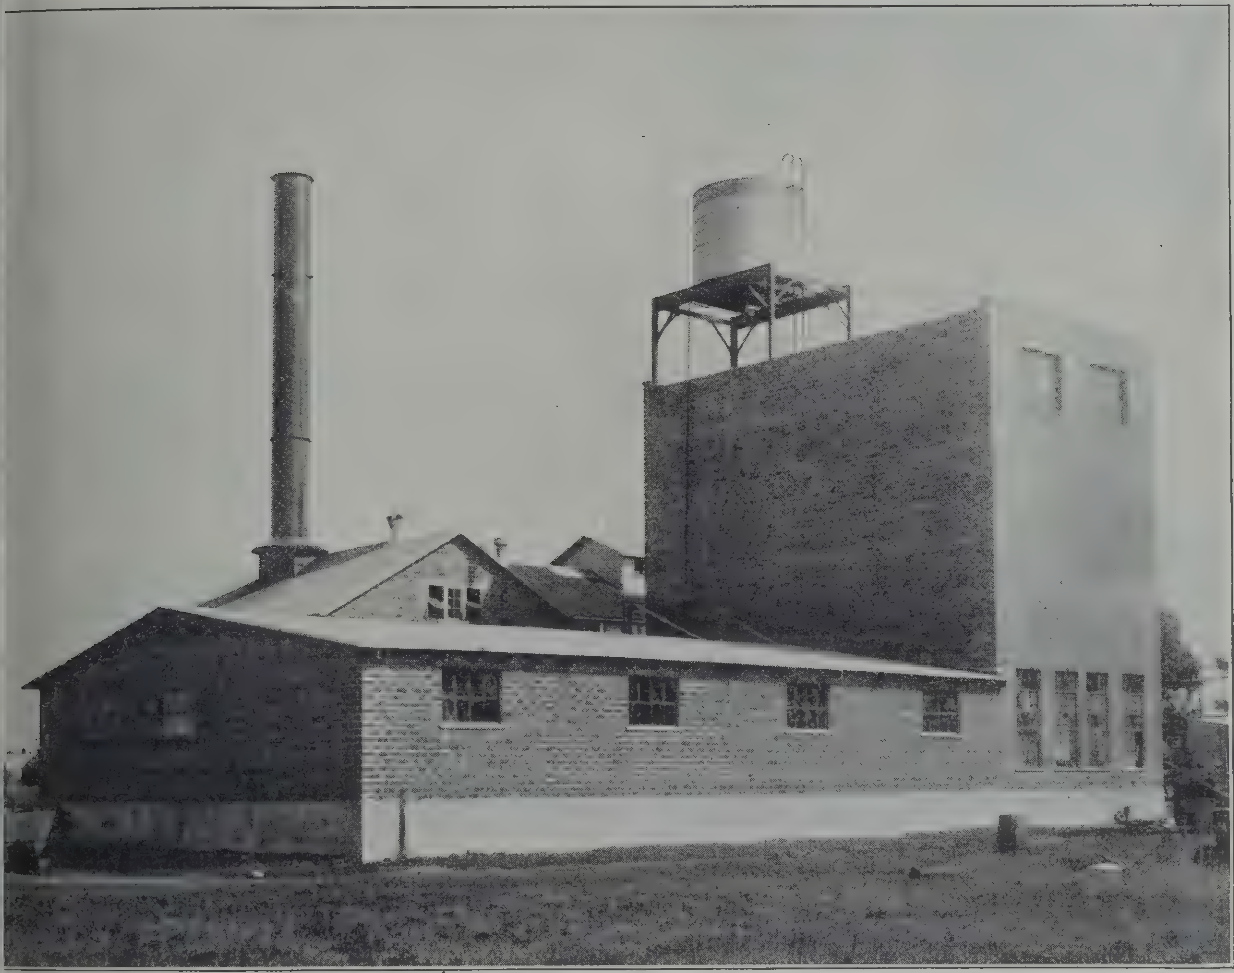
UTHITT MILK POWDER PLANT

GRAY-JENSEN SPRAY PROCESS

Designed and Built by

DOUTHITT ENGINEERING COMPANY

100 WEST MONROE STREET, CHICAGO



Sheffield Farms Company's plant at Lisbon, N. Y.

Add to your creamery profits by manufacturing your skim milk, buttermilk, or whey into powder on the Gray-Jensen Spray Process Milk Powder Plant.

The highly developed efficiency of the Gray-Jensen process results in recovery of milk powder actually equivalent to the solids in the milk, with lower labor, fuel and power costs than are possible with any other type of milk powder plant. These savings alone pay for one of our plants in from one to three years. Operating records prove this.

We can furnish an assured market for all skim milk and buttermilk powder made on our plants.

These plants are built in sizes to handle from 10,000 to 120,000 pounds of normal liquid milk or milk products daily.

Write today for booklet describing the Gray-Jensen Spray Process Milk Powder Plant

Friendly Talks on the Important Subject of Sterilization

Conducted by
J. W. YATES
formerly Dairy & Food Commissioner, Health Dept., Kansas City, Mo.

Talk No. 8

Sterilizing large surfaces to which milk is exposed by spraying with B-K

The problem of treating large surfaces in milk plants, such as open coolers, storage tanks, pasteurizing vats, is being successfully solved by applying B-K dilutions through the medium of a spraying machine. It is effectively and easily used at the logical time, **just before the equipment makes contact with the milk.**

We have under observation several plants that have satisfactorily sterilized and pasteurized equipment at an extremely low cost, using the B-K method with a spray as the only sterilizing agent. The success of this procedure is due to the uniform and dependable strength of the B-K solution, plus its effectiveness as a germ destroying agent, plus the ease of application, plus the sound principles that are behind its activity as a germicide.

The use of the spraying system relieves the necessity for making up batches of solutions of sufficient amounts to cover large surfaces, such as storage tanks, holding vats, tubular coolers, weigh tanks, dump vats, etc.

The great variety of pasteurizing equipment makes it impossible for us to prescribe here definite treatments for them. But we will be glad to give you definite and particular information regarding this method of using B-K in your plant, if you will

nother big reason . . why *Jamison* Doors are well worth the little more that they cost . . .

Jamison Doors
JAMISON COLD STORAGE DOOR CO

Your request for our new Catalog No. 13 brings you —quickly—complete information on Jamison Cooler and Freezer Doors and Automatic Ice Chutes. Send for it now and HAVE it when you need it.

THERE is no art in knowing how to make a cheap product. We *could* lower Jamison Prices by lowering Jamison quality—and no doubt the Doors still would sell. But our gain in selling such Doors would be just as short-lasting as your "economy" in buying them. There are several reasons why Jamison Cooler and Freezer Doors cost a little more and are well worth it. One of them is the *Jamison Patent Self-Tightening Fastener* shown above.

Constructed with massive, sturdy simplicity—with tough drop steel forgings for its moving parts—the Jamison Fastener continues to "hold its own" through a lifetime of hard knocks. The harder you slam it the tighter it grips. No slips, no rebounds, no slackening after it takes hold. And how it *does* take hold! With automatic bull-dog grip it *continues* to exert a constant inward pressure on the door, against its seals. The door cannot be jarred, pushed, bumped or blown open accidentally or carelessly. The handle must first be turned—and that so easily that a child can do it.

Yes, you *can* get *less* Door and less Protection for a little less (first) Cost than a Jamison. In fact, only Jamison's big volume of production keeps our prices as low as they are. But the same factor that makes our volume possible also proves that Jamison superiorities are well worth the difference: *Jamison* Cooler and Freezer Doors outsell all other makes *combined*. That's food for thought—and action!

Jamison Doors

special attention and recording thermometers tested for accuracy at least once every two weeks.

4. All persons engaged in handling milk, either before or after pasteurization, shall be required to exercise scrupulous cleanliness and must not harbor the germs of typhoid fever, tuberculosis, diphtheria, or other communicable diseases liable to be conveyed through the milk. Absence of such communicable disease may be determined by cultures and physical examination to the satisfaction of the local health officer or milk inspecting department.

5. Each dairy or distributor of milk and cream shall be kept informed of the results of the laboratory examinations and scoring of their individual products and equipment. On the basis of these determinations the inspecting departments shall issue written authorization to each person or concern who desires to sell milk under its jurisdiction; provided, that authorization shall be revoked in every case when the product or equipment of any person or concern does not consistently meet the requirements of the "Pure Milk Law" or of the rules and regulations for its enforcement.

6. In case an official plate count exceeding the legal standard is obtained, the milk inspecting department shall make at least three recounts within a period of two weeks in addition to the routine milk examination whereupon, if the count is persistently high and the average count obtained during the two weeks period exceeds that established by the "Pure Milk Law" such milk may be degraded, or, at the option of the milk inspecting department, excluded from the local market. Whenever the product has been degraded by this procedure, such product shall not be re-established at its previous standing for a period of at least four weeks during which time it must have met the requirements of the "Pure Milk Law" as determined by official count. All recounts are considered as official samples in computing final milk scores.

7. All publications or public statements relating to the quality of milk or cream, or the condition of dairies or milk plants, shall be expressed in terms of percentage, one hundred being considered perfect. In rating milk or cream this percentage shall be based on an average of results obtained by the examination of at least four samples taken at intervals of at least a week. In no case shall publication of numbers of bacteria be made. The method used for computing milk scores for publication shall be approved by the department of agriculture of the state of California.

Rule 4. Standards.

1. The standards for the various grades of milk shall be those established by the "Pure Milk Law" and in addition the following requirements with respect to cooling.

(a) Grade "A" raw milk, when distributed twice a day by the producer, must be cooled to a temperature of 60 degrees F. or below, immediately after being drawn from the cow, and so maintained until delivery to consumers.

(b) Grade "A" raw milk, when distributed once a day by the producer, must be cooled to a temperature of 55 degrees F. or below immediately after being drawn from the cow, and thereafter maintained at a temperature not exceeding 60 degrees F. until delivery to the consumer.

(c) Grade "A" raw milk bottled at a distributing plant must be cooled to a temperature of 55 degrees F. or below, immediately after being drawn from the cow, and thereafter maintained at a temperature not exceeding 60 degrees F. until delivered to the consumer.

(d) Grade "A" milk for pasteurization r
cooled immediately after being drawn f
cow to as low a temperature as practica
maintained until delivery to the plant.
pasteurization, milk must be cooled to a
ature of 50 degrees F. or below, and s
tained until delivery to the consumer.

Rule 5. Labeling.

1. Graded market milk must be labeled to
following information:

(a) Name of product, using one of the fo
legal terms to correctly define the grade
Certified Milk
Guaranteed Raw Milk
Guaranteed Pasteurized Milk
Grade "A" Raw Milk
Grade "A" Pasteurized Milk
Grade "B" Pasteurized Milk

(b) Name of producer or distributor.

(c) Address of producer or distributor.

2. Special designating words such as "In
Milk," "Extra Quality Milk," "Purity Guara
"Special Baby Milk," etc., must not be used.

In connection with each of the grades of m
average quality found on the market is far supe
the actual requirements. While 100,000 bacte
milliliter are permitted for grade A raw, the
bacterial count for that grade is less than 15,00
distributor of grade A raw milk having placed
market milk with an average bacterial count of
a period of over one year. Many producer-distr
are regularly supplying a milk with a cou
1,000 or less.

While fifteen thousand bacteria per milliliter
lowed for grade A pasteurized milk, the average
state is less than five thousand per milliliter
majority of the distributors of that grade of mil
on the market a product with an average bacteria
of less than two thousand throughout the entir
It is quite apparent therefore that a revision of th
grading standards is in order. A revision that wil
the standards more nearly representing the actua
ity of the product is indicated, and is now unde
sideration by the legislature.

Previous to the adoption of the pure milk
1916, providing for milk grading on a statewide
a few of the larger cities maintained a local insp
service with independent standards which were n
form. However, most of the local departments
tioning effectively at that time adopted the state g
standards and applied for state approval, so th
program was inaugurated with fifteen local depar
for the most part operating in the larger centers of
lation.

It might be of interest to note that up to thi
and for several years following, inspection was
lished only upon the solicitation of the public and
authorities, the primary object being the protect
the public from unwholesome milk. The recognit
the benefits to the dealer of inspection service
later development.

The original fifteen departments continued to
ate along approved lines but there was not much ac
in extending the work until 1923, at about which
the value of an adequate milk control service b
apparent to the producer and dealer to such an e
through strict enforcement of the standards, that
cations for this type of service upon the part of t
dustry occurred with increasing frequency. In so
stances the desire for the protection offered th
local inspection on the part of the industry exc

the appreciation of the local governing bodies for that work. In some cases where local governing organizations refused to provide funds for the milk control service the dealers involved desired a program to such an extent that they voluntarily supported placing the work on a self-supporting basis through levying a registration fee based on the amount of milk distributed by each.

At the present time there are eighteen departments in the state supported entirely, or in part, in this manner, the fees ranging from two-tenths of a cent a gallon to one cent a gallon. In no case has there been an increase in the price of the milk to the consumer as a result of such fee. Intelligently conducted inspection will more than pay its own way, and the benefits derived by the producer and distributor have more than paid for the cost of this service to them. While the consumer receives protection from the possibility of obtaining an unwholesome or adulterated product at all times, the milk dealer receives protection from illegitimate competition, that is, the competitor who has no regard for public health nor honest business, which in many cases has proven to be the most distressing feature of the milk business.

The milk business is much more scientific than is generally recognized, being based on the laws of chemistry, physics, bacteriology and the principles of sanitation. The producer and dealer are, therefore, frequently confronted with trade problems which they do not have the facilities to solve. The solution of these trade problems is a service offered by an efficient inspecting department, and has in many cases proved to be an important factor in the economy of the production and distribution.

Public appreciation of a commodity is shown through increased purchases. This is especially true of milk and dairy products. There has been an average increase in the sale of milk amounting to at least twenty per cent in all communities after the adoption of a milk inspection program. In addition to whatever milk demand is due to new population, a market has been created solely through increased per capita consumption, amounting to an annual increase in the business of the milk distributors of California of over ten million dollars. This has been brought about through improvement in the quality of the product and resultant increase in confidence of the public in the milk supply.

In 1923 five new -departments were approved, in 1924 ten departments were added to our list, in 1925 seven more were approved, in 1926 four departments were approved, and four departments have been approved so far in 1927, bringing the total to forty-five. A number of these departments extend over entire counties and several to groups of cities, altogether extending the benefits of a graded milk supply to two hundred and forty cities and towns in California, the population of which consumes over ninety per cent of all of the market milk sold in this state.

Since the state department of agriculture is charged with the responsibility for the work of all approved local departments it was necessary that a program of supervision over those departments be inaugurated. This work was placed in charge of a market milk specialist at the time the work was limited to the original fifteen departments. During the past five years the program has become so popular to the public and the industry, being responsible for a rapid expansion of the work, it required the services of two full time market milk specialists to maintain the supervision of the forty-five local departments now in existence and to render assistance in organization work in other communities desiring this service.

Prior to 1923 the United States Department o culture through their market milk specialist con surprise milk scoring contests in some of the Cal cities where inspection was maintained. These c were conducted largely from an educational star and upon the option of the local department. sults obtained by the milk scoring were so imp that the California Department of Agriculture a the surprise contest as a fundamental part of th gram of supervision maintained over the local ap departments.

A fact generally accepted by milk control offi that a single examination of the product may representative. Therefore, the more samples th be included in arriving at the final rating, the m liable the results will be. We, therefore, include final rating in addition to the results obtained time of the contest, the average results secured local laboratory for a preceding period amount approximately four months. A reliable rating also take into consideration all factors affecti quality of the product, which is accomplished by t of the United States official milk score card, al thirty-five per cent for bacterial analysis, fifteen pe for flavor and odor, ten per cent for sediment, fifte cent for butterfat content, fifteen per cent for soli fat, five per cent for acidity, and five per cent for and cap, making a total of one hundred per cent.

In addition to supplying us with definite in tion as to the quality of the milk itself, we ar through the milk contests to obtain information in days time relative to the field and laboratory m employed by the local department that would ta weeks to obtain in any other manner.

The milk scoring carried out in our program i fornia through holding surprise contests at freque regular intervals throughout the year in each app local inspecting department, together with publishi results by the local press, has proven to be very ben in improving the quality of milk sold in Californi fact, such contests furnish the necessary commerc centive to constantly maintain a uniform high q milk. In times past the dairymen or distributors agree in a general way to the fundamental necess maintaining a high standard of quality, but in practice, with rare exceptions, expediency, prevaile the quality sucered. The surprise milk scoring co and the subsequent publicity has removed the q quetion from the position of remote fundamental has placed it in the class of immediate expediency a the forefront of eminent business necessity.

The published results of these contests draw th tention of a sufficient number of consumers to ca material loss in trade for those dairies at the bott the list and a corresponding gain for those at the t

Through our milk scoring program and the eff services rendered by each of the local approved de ments, together with the splendid co-operation o milk dealers themselves the average quality o graded milk in California has improved from proximately ninety per cent in 1923, computed o basis of the United States official milk scoring card weighted average of over ninety-five per cent, wh now being maintained in each of the two hundre forty cities and towns included under this progra

Just What You Have
Been Waiting For—

AN Extensive and Authoritative Experiment with Children to Prove the Wonder-
ful Value of Milk

Up to the present time, practically all ex-
eriments to prove the value of milk have been
nducted on animals, and it has been necessary
try to persuade the housewife that if milk
ade animals grow then it would make children
ow. Now, however, information is available
owing what milk actually does for **children**.

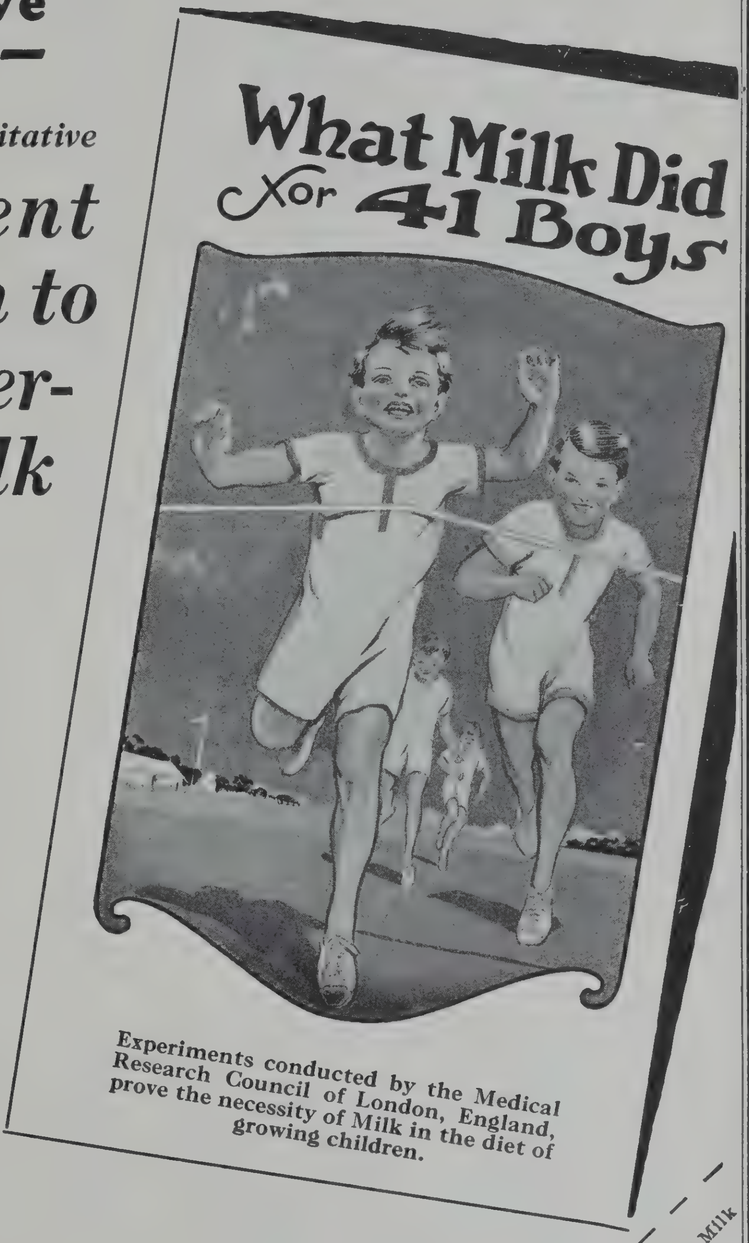
The Medical Research Council of London,
nducted an experiment on 220 boys. Their
ndings are given in a popular way in this little
page folder—actual size shown here.

You can now secure these folders for your
n use in any quantities desired. Your name
n be imprinted on the back page if you wish
a slight additional cost ($1.50 per M; 10,000
more $1.25 per M).

These valuable circulars suitable for enclos-
g with your monthly statements, for distribu-
n through your driver-salesmen, and of great
rth in many other ways, will cost only—

$5.00 per M for 1,000 to 10,000
4.50 per M for 10,000 or more

Your order will be filled promptly.



What Milk Did For 41 Boys

Experiments conducted by the Medical Research Council of London, England, prove the necessity of Milk in the diet of growing children.

Don't overlook this opportunity. Every customer and prospective customer should know of this wonderful experiment on children.

Clean Equipment Lasts Longer

It is a well known fact that things kept clean will last longer and wear better. This is especially true with all equipment in the milk business. Here, cleanliness is an absolute necessity irrespective of the cost.

And when Solvay Super Cleanser is used the cleansing is perfectly done while the cost is extremely low.

SOLVAY
SUPER CLEANSER

Trade Mark Reg. U. S. Pat. Off.

the ideal cleaner and cleanser, is produced and sold direct to the trade by the largest producer of alkali products in the United States.

You receive the benefit of the large scale operations and enjoy an exceptional product at a most reasonable cost.

Place your special cleaning problem in the hands of our Technical Service Department. Their experts will help you. No charge of course.

You can quickly demonstrate the efficiency of Super Cleanser—send today for a testing sample and a copy of the Super Cleanser booklet.

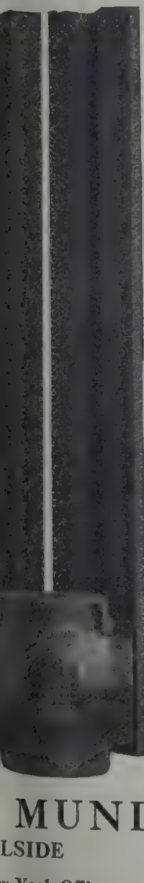
l cold pipe lines in the New ss Building, San Francisco, e efficiently insulated with



At the left is an unretouched photograph of two half sections of Mundet Jointite Cork Pipe Covering, and a Mundet Jointite Cork Fitting Cover.

Mundet Jointite TRADE MARK **Cork Pipe Covering**

Thirty-seven stories high, this tallest building on the Pacific coast is also one of the most modern in the world.

You can drive your car right into the building, which is provided with a 400-car garage for tenants' use. No more parking troubles. Entrance on two main traffic streets. Then go directly to the office by express elevator. That's just ONE of the modernizations.

In the building are thousands of feet of ice water pipe lines. It is important from the standpoint of economy, year after year, that all such lines be PROPERLY insulated.

MUNDET JOINTITE CORK PIPE COVERING was chosen for this purpose. Our own contract department applied the covering.

Our Practical Refrigerating Engineers cover the entire United States. Our service is complete—we manufacture, consult, sell, and install.

MUNDET & SON, Inc.

Manufacturers of Jointite Pure Cork for all cold insulating purposes

Let *both* talk QUALITY!

YOU want your product to talk quality—to *look* clean and wholesome, because such an appearance helps sales. Yet what a handicap it must overcome when carried in delivery units that tell a different story. For people *do* form an opinion of your product and plant from the appearance of your trucks and wagons.

Let your delivery units talk quality, too! Let their appearance attract favorable attention. Clean them regularly with Oakite. Free them of all road dirt, tar, oil and grease, and *keep* them looking clean—it pays.

Every phase of dairy cleaning is included in our booklet "Oakite in Dairies." A copy is yours for the asking.

OAKITE IS MANUFACTURED ONLY BY

GARDEN SPOTS OF INDUSTRY.

An analysis of manufacturing statistics by the department of manufacture of the chamber of commerce of the United States shows that there is no particular section of the United States which might be regarded as the garden spot of industry. Industry is growing in various sections. As expressed in the number of wage earners per 1,000 of population, the country as a whole shows an increase of 5.4 per cent for the past 15 years, the age of the chamber. For the North Atlantic Seaboard the number of wage earners engaged in manufacturing has not kept up with the rate of growth of the population generally. On the other hand, Michigan shows a 30 per cent growth; Indiana and California a 25 per cent growth, and the other Pacific Coast states—Washington a 33 per cent growth, and Oregon a 60 per cent growth.

Contrary to some statements, the departm that the growth in manufacturing in the Sou states has been less than for the country as a the basis of comparison with population. Th for North Carolina is 3.8 per cent; South Car per cent, and Georgia, 3.0 per cent.

When it comes to density of manufacturing, England States, of course, still maintain a long other sections of the country. In Rhode Island ample, there are over 200 wage earners per 1,0 lation, and for the New England States as a wh 150. The density in Illinois is 93 wage earners population, in Indiana 88, and in Michigan 116

On the West Coast the density of manufact California is 67 wage earners per 1,000 popula Oregon 69, and in Washington 79. In the United a whole there are 78 wage earners per 1,000 po

Ask for Bestov Filter Bulletin

Cherry-Bassett Company

Phila., Pittsburgh, Baltimore, N. Y. City, Syracuse

When writing to CHERRY-BASSETT COMPANY *please mention The Milk Dealer.*

PROF. BURKE'S INQUIRY DEPARTMENT.

(Continued from page 32)

the average per cent of solids present (the rest being water) we have 60 × .089 = 5.34 pounds of solids-not-fat. Thus we have 40 pounds of fat + 5.34 pounds of solids-not-fat present and the balance, or 54.66 pounds, is water.

Now, for your third question. The addition of .4 per cent inoculation of buttermilk to milk for cottage cheese is for the purpose of developing flavor and rapidity of ripening rather than texture. Cottage cheese to be palatable must contain some acid, otherwise it would taste flat. The proper texture is developed chiefly by handling the curd in the correct way after the product is properly ripened.

* * *

Kansas.

Dear Sir:—At the present time we are buying approximately 50,000 pounds of milk a day. Securing an accurate test as a basis of paying our customer has become quite a problem. At the present time we are taking from three to four tests of milk for each customer during a pay of fifteen days, and averaging these tests to determine an approximate test of his milk for that pay.

If possible, we would like for you to furnish us with whatever information you have in regard to the accuracy of this method as checking against the 100 per cent correct method of testing the milk each day.

Please give us the per cent of accuracy for one test during the fifteen day period, for two tests, and so on up to fourteen tests during the fifteen days.

Reply: Some years ago Hunziker reported in the Purdue experiment station 27th annual report, some very interesting figures on the accuracy of samples of milk which were tested every two, three, four and five days, and compared with composites and daily samples. These tests were found to check very closely with tests made daily, as reported in the following table:

	% Fat	Lbs. Fat
Daily samples	4.90	31.94
Composite samples aliquot portions.......	4.865	31.72
Composite samples equal portions........	4.870	31.75
Daily samples every second day.........	4.914	32.04
Daily samples every third day...........	4.905	31.98
Daily samples every fourth day..........	4.903	31.97
Daily samples every fifth day............	4.893	31.90

In the Journal of Dairy Science for 1921, page 351, Judkins ran some comparative tests. In this work, milk brought to the plant by twelve patrons was tested according to the following method:

1. A complete sample taken with a milk thief and tested twice monthly.
2. A composite sample taken with a dipper and tested twice monthly.
3. A test on the 15th and 30th of the month, added and divided by two,
4. A test on the 15th and 30th of the month, used in figuring the true average test by finding the pounds of fat and dividing by the pounds of milk.
5. A test made on the 10th, 20th and 30th of the month, added and divided by three.
6. A test on the 10th, 20th and 30th of the month, used in figuring the true average test by finding the pounds of fat and dividing by the pounds of milk.

Method	No. times difference is .2% or more	Smallest difference	Largest difference	Average difference
Tube+or—daily test..	1	+.012	+.209	+.031
Dipper+or--daily test	1	—.007	+.250	+.057
Dipper+or—tube test.	0	—.000	+.186	+.026
Sum of 2 tests÷2+or ---daily test	6	+.009	+.415	+.136
True ave. test 2 tests+ or—daily test	5	+.007	+.404	—.098
True ave. test 3 tests+ or—daily tests.....	1	—.015	+.204	—.022
Sum of 3 tests÷3+or —daily test	1	—.003	—.204	+.092

He states, "Since considerable figuring is n
to calculate the true average test of a large nu
patrons when samples are taken three times a
is very interesting to note that the last meth
tioned in the table, namely, adding up the three t
dividing by three comes so near the results obta
daily testing, and even nearer those obtained
posite sampling, that the method is worthy of
mendation."

Your attention is called to the fact that meth
above, where two monthly tests were added and
by two, and also method four, where the two
tests were used in figuring the true average te
both less accurate than the other methods. The
of using three monthly tests, adding these and
by three gives very accurate and satisfactory re
believe if you were to follow this practice of
three tests during a fifteen day period you wou
an average test very close to one where the te
made daily.

Oklah

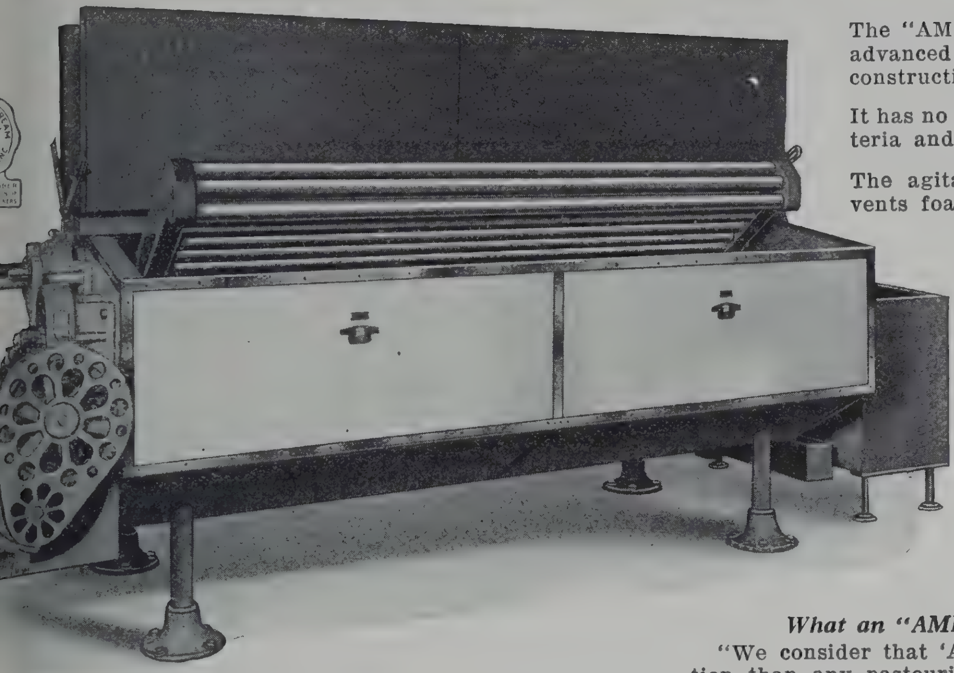
Dear Sir:—Will you please send us all the i
tion you can on cooling and caring for milk?
the lowest bacteria count you know of and wha
missible? We milk in covered buckets throu
thicknesses of cheese cloth, strain into cans
four thicknesses and then through cotton and into
through two more layers of cheese cloth. We
cans in a tank of ice water that comes up to the
can. All strainer cloths are washed and boile
daily. We wash our bottles, using Wyandotte
and rinse in water which has B-K. Put bottles i
izer, give them 180 degrees.

Our cows are clean and yet they claim a pa
does none of these things has a count of 3100 b
and we 7000. We cannot account for it, and if
tell us anything to do to make our milk better
appreciate same.

Reply: You certainly appear to be handling t
properly. There are, of course, several causes
terial contamination of milk. One is the dust a
which falls into the milk and the other is throu
teria in the udder of the cow. As a rule the milk
from the cow's udder seldom contains a thousa
teria per cubic centimeter, which is very low,
stances are on record where milk has been obta
a sterile condition. The count which you are ob
of seven thousand, is certainly very low and I do
lieve I would worry about the bacteria count if
not run any higher than this. The law specifies n
100,000 bacteria per cubic centimeter, so you see
basis you are well within the law. There may b
reasons why the party to whom you refer is putt
milk with a count of 3100. May be in your he
cow is secreting milk with a much higher bacteria
than the others.

I note you mention the straining of milk. St
does not remove bacteria. Bacteria are so minu
they readily pass through the pores of cheese clo
thin cotton disc. The idea in every instance sho
to keep any dirt particles, however small, from
into the milk, as they usually harbor many thousa
bacteria. Of course, once the dirt falls in the on
to remove it is by straining, which should be pra
I suggest that you try boiling your utensils in wa
five minutes after they are thoroughly washed an
rinse them with the water containing hypochlorit
tion.

AMERICO" THE PASTEURIZER WITH A PURPOSE



The "AMERICO" embodies the most advanced principles in design and construction.

It has no stuffing boxes to gather bacteria and contaminate the batch.

The agitation is gentle. This prevents foaming, churning and breaking of fat globules.

Heating is done with water below 160° F. There is no burning on the coils nor scorching of the product.

The flush type outlet valve is standard on all vats.

Thorough cleaning of all parts is accomplished with ease as the coils can be raised out of the vat.

What an "AMERICO" User Says:
"We consider that 'AMERICO' is nearer perfection than any pasteurizer we have ever used."

new "AMERICO" with improved coil control

"Highland—The Better Milk"

New St. Louis Plant "The Last Word" in Appointment and Efficiency. Company Officials Insist That Their Best Advertisements Are Their Products

SUCH is the significant slogan of the Highland Dairy Farms Company, an organization of over 600 farmers, who entered the milk business six years ago, and are now one of the dominating factors in the St. Louis market, with a beautiful new pasteurizing and bottling plant in Highland, Ill., and distributing plants in St. Louis, Mo., and East St. Louis, Ill. This new country plant is one of the most beautiful in the country, erected and equipped at a cost of over $225,000.

Progressive Spirit Aids Growth.

The wonderful, progressive spirit of every man in the organization has made possible this remarkable record of achievement. Established on April 1, 1921, and starting from "scratch," the company is actually putting onto the market every day over 140,000 pounds of milk in the form of various dairy products.

Exterior of the Highland Dairy Farms Company's new plant located at Highland, Ill., 35 miles east of St. Louis, where the product is marketed. The building was erected and equipped at a cost of $225,000.

Credit for this achievement is due to the quality of the products marketed; the enthusiastic co-operation of the entire organization; and to the careful management of the board of directors, who are directly represented in the affairs of the business by Julius Reinhart, president; August Weder, vice-president; B. F. Tschannen, secretary, treasurer and general manager. The energy and good business judgment of Mr. Tschannen, the general manager, is in a great measure responsible for the growth to a larger and more profitable business through each year.

The first few years were not entirely free from struggle, however, after the crisis period was passed, the growth became steady and determined. The company is free from debt, and in 1926 had a gross volume of well over $2,000,000.

New Country Bottling Plant.

The new country plant is as fine as any in existence today, as the illustrations clearly show. It is 103 feet in length, 83 feet in width, and three stories high. A concrete driveway runs entirely around the building; the incoming milk being received on one side and the bottled milk being trucked away to market from another side, so that the two lines of vehicles do not interfere, one with the other. The outside walls are of rough matt brick and stone trim. The inside walls are of glazed
white brick, the ceilings and columns are of gl
white "Sarryonyx," and the floors are all of "T

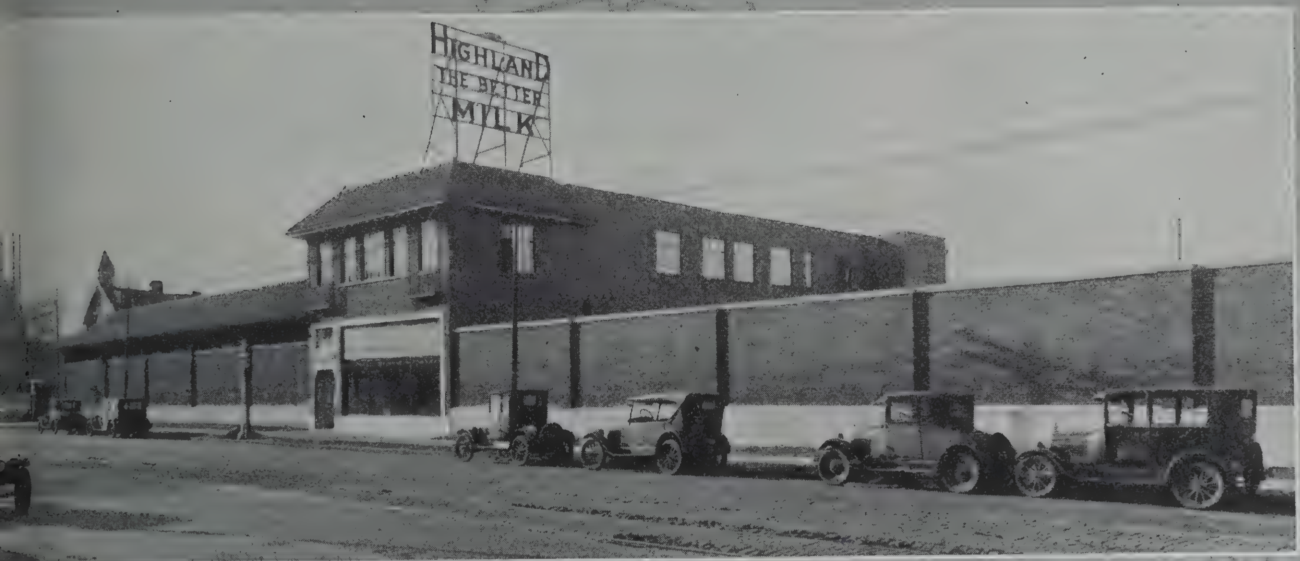
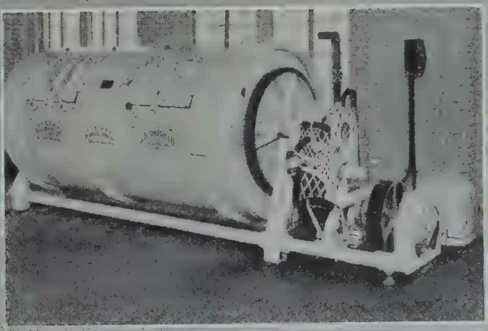
The Highland Dairy Has Perfected Every Detail of Production, Management and Distribution



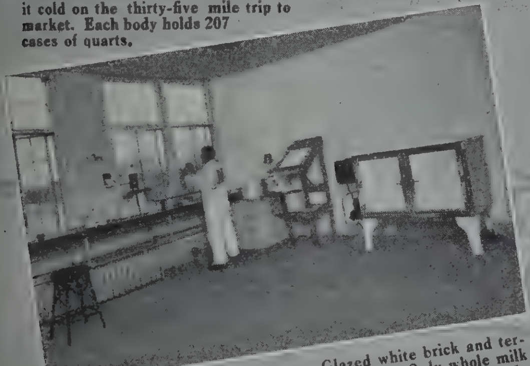
The St. Louis distributing plant, erected two years ago to handle the increasing business. Here the milk is delivered from the country plant and redistributed to the wagons and motor trucks which handle the 80 routes in St. Louis.

THE MILKY WAY
HIGHLAND
DAIRY FARMS CO.

One of ten tractors and bodies for hauling the bottled milk to the distributing plants in St. Louis, Mo. and East St. Louis, Ill. The bodies are insulated and the milk is iced, thus keeping it cold on the thirty-five mile trip to market. Each body holds 207 cases of quarts.



Interior of the Churning Room showing motor-driven, gear type No. 18 Cherry Dreadnaught Churn which turned out over 37,000 pounds of butter in March.



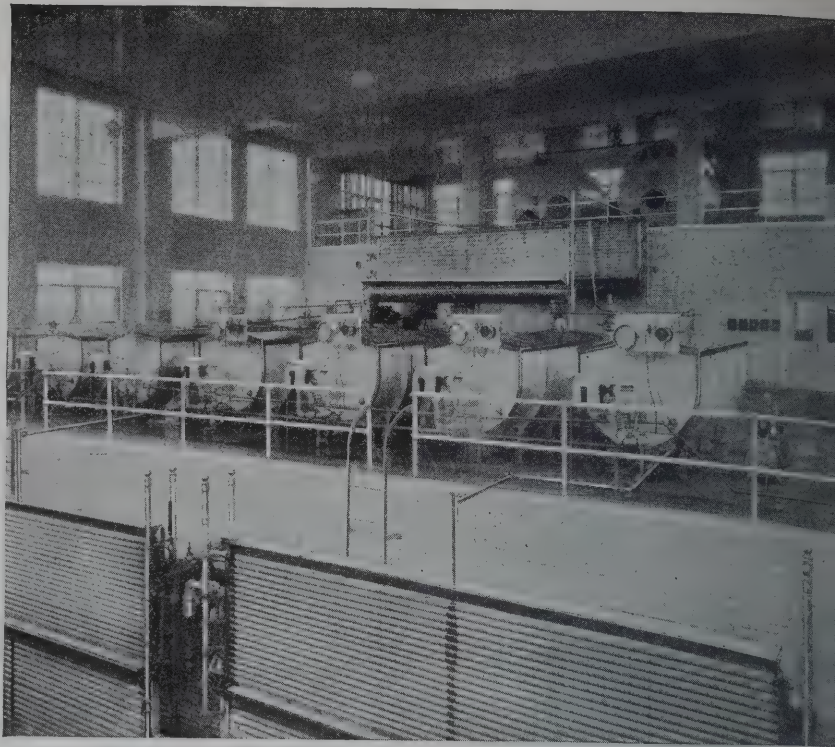
The laboratory and testing-room. Glazed white brick and terrazo floors here, just as in the whole building. Only whole milk is purchased from the 1,200 producers supplying milk for "Highland" products.

The unique directors' room in this new plant. The pasteurizing room can be seen through the plate glass partition which makes up one entire wall. The business office at the other end of the building is similarly arranged.

butter or for bottled table cream is put through the separator.

The milk, after clarification, flows over the secondary tubular preheater (12 tubes—14-foot—3-inch) and is further aerated while heating to about 138 to 140 degrees F. before being discharged into four 600-gallon twin coil pasteurizers. made of pure nickel, direct-connected, motor-driven, fitted with valves and equipped with automatic air-operated temperature controllers which automatically shut off the flow of the water when the milk has reached the pasteurizing temperature absolutely for the 30-minute holding period.

These pasteurizers heat and hold every particle of the milk at a uniform and positive temperature, and cannot overheat a batch of milk. This insures a maximum cream line and makes it absolutely impossible to impart a scorched or cooked flavor to the milk.

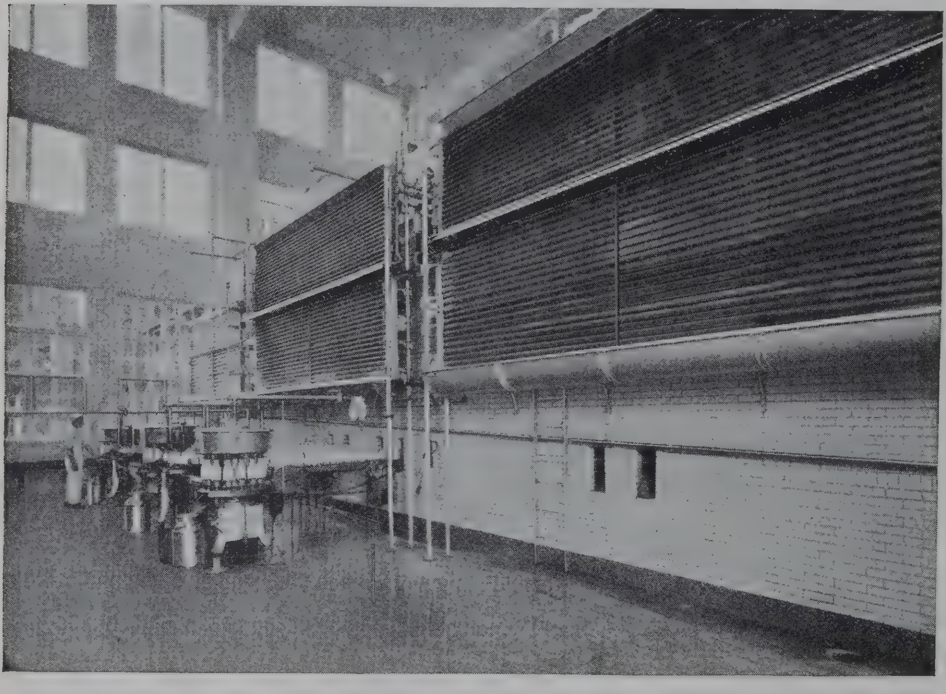


The beautiful pasteurizing room showing seven twin coil pasteurizers, five
lon machines of pure nickel and two 500-gallon glass-lined, all with pure wh
ous enameled outside bodies. All machines are equipped with the latest flus
The four pasteurizers used for milk are automatically controlled (by air pres
it is absolutely impossible to overheat a batch of milk. Note the primary and s
tubular pre-heaters. The first pre-heats to separation and clarification temp
the latter to about 136 to 138 degrees F.

The hot water is pumped from a hot water heater or master supply tank in which the water is controlled to a low temperature, which will have no injurious effect on the milk and yet is hot enough to pasteurize the milk rapidly. With this type installation, which controls the temperature of the water and also controls the flow of the water, it is absolutely impossible to ruin the creaming ability by overheating, or to impart a cooked flavor to the product.

After heating and holding so accurately and positively, the milk flows (still by gravity) over two tubular surface coolers (20 tubes water—20 tubes direct expansion) where it is cooled to 32 degrees F. for bottling by two fillers and cappers.

The tubular cooler on the left of the illustration showing the coolers (12 tubes water—12 tubes
expansion) is for cooling table cream, culture
milk and buttermilk. These products are also
to 32 degrees F. and bottled by the third fil
capper.



Two 40-tube tubular coolers for milk, 20 tinned copper tubes for water and 20 nickel tubes for direct expansion. Also one 24-tube cooler for cream and buttermilk, 12 tubes for water and 12 tubes for direct expansion. All cooling is to 32 degrees F. before filling and capping on three fillers and cappers. Note provision for additional battery of fillers. A chart is kept on a recording thermometer of each day's cooling. Redistribution troughs keep the milk flow in an even film.

Handling of By-products.

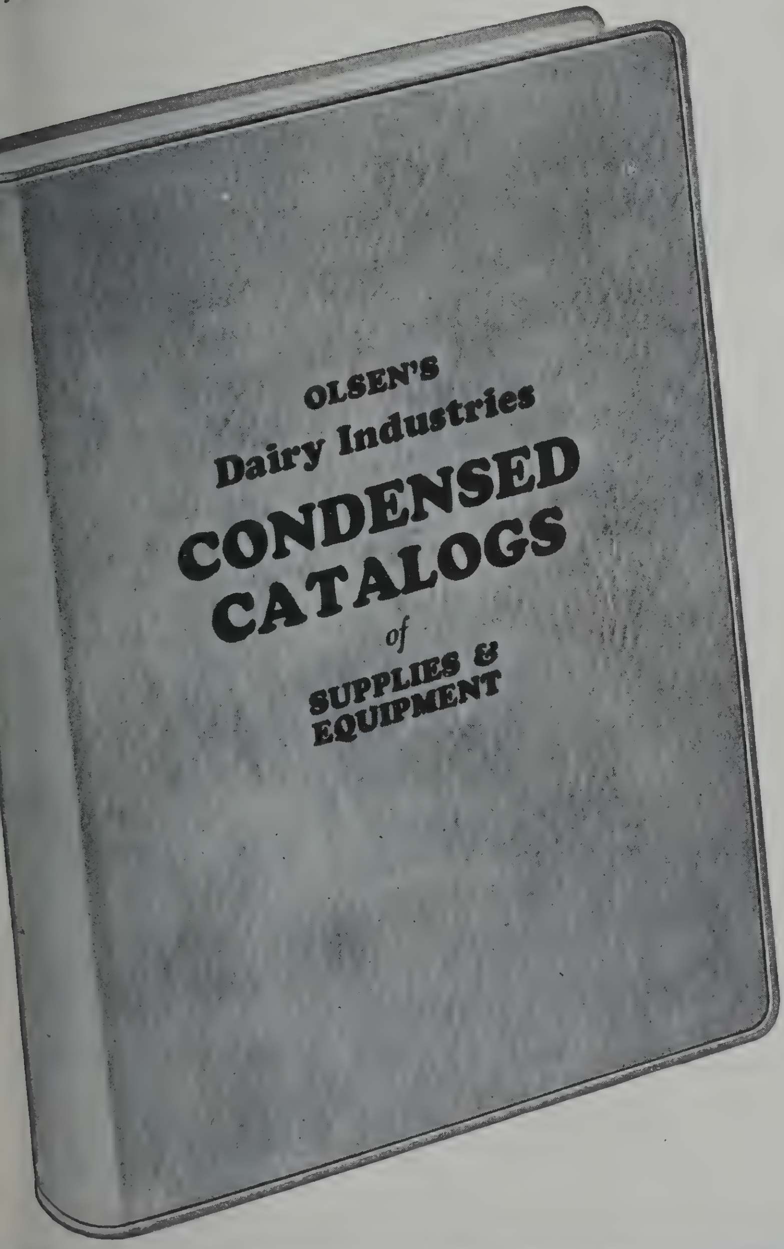
Roomful of Catalogs
One Volume

HERE is one of the most helpful and important works ever undertaken in the Dairy Products Industries. Now, when you need buying information, you don't have to rummage through files looking for catalogs and literature that has been faultily filed or, more likely, lost. Just look up the product or service in Olsen's Dairy Industries Condensed Catalogs. You can buy directly from this book because it contains detailed data and information, specifications, tables of weights and sizes, illustrations and descriptions of the more important products and services used in all branches of the Dairy Products Industries.

x12 inches.
ly Bound



This Book is FREE to Dairy Industries Buyers

Olsen's Dairy Industries Condensed Catalogs is given to you on a registered loan basis, free of charge. Each year it is replaced with a new volume. It is heavily bound, standardized in typographical form, and cross indexed so that you can quickly find complete buying information and specifications on any product or service in which you are interested. It is a roomful of catalogs condensed into one handy volume—always at your fingertips.

Olsen's Dairy Industries Catalogs will be ready for distribution within a short time. To get your copy early, please send in your request now.

Here is what two of the Country's Largest Dairy Products Concerns say:—

"We understand you are getting up a dairy industry reference catalog, giving specifications and data, on various types of dairy equipment. Please be advised that we are most anxious to have you send us one of these as soon as they are ready for distribution. We think this would be a most useful catalog to have in a dairy plant."

"I think your idea of publishing the consolidated catalog for the Dairy Products Industries will prove to be one of the best helps I know of for the buyer. It is a thing that I have been looking for for a long time and I am sure that it will prove an invaluable help. There are many times I want to obtain references for some article which we use around the plant and it is sometimes a week or two before I am able to locate anyone handling it. If there is anything we can do to further assist you in your plan, kindly call on us."

◆

ATTENTION EQUIPMENT AND SUPPLY CONCERNS

This is not an advertising medium, in fact, no display advertising is accepted.

It is the standard Buyers' Reference Book made up only of Condensed Catalogs.

is the only process that—

Produces a uniformly high grade Milk Powder.

Guarantees complete recovery of solids.

Produces milk powder completely soluble even in ice water.

Gives you greater capacity at lower costs.

Guarantees uniformly low moisture content.

Eliminates all possibility of second grade powder.

That's why there is more milk powder produced by Rogers Spray Process Milk Powder Plants than by any other process.

That's why Rogers Spray Process Milk Powder is always in demand.

Rogers Vacuum Pans

Rogers Vacuum Pans are the most efficient means of removing water from milk. They double the capacity of your drying unit, besides putting you in position to take advantage of the Condensed Milk market, as well as the Milk Powder market.

Rogers Vacuum Pans, as well as Rogers Drying Equipment, can be operated efficiently on exhaust steam.

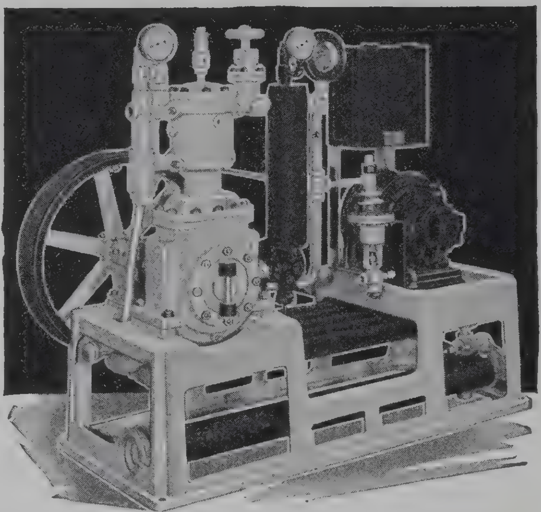
ROME
FULL AUTOMATIC REFRIGERATION



Installed Easily and Economically

A wise old Milk Dealer once said, "You can't beat our milk, BUT you CAN whip our cream."

Without doubt the above remark was made because the Milk Dealer had already installed a Mechanical Refrigerating Machine.

The ROME FULL AUTOMATIC is quickly, easily and economically installed and on such reasonable terms that no Milk Dealer need be without a Rome. Fill in your name and address below and mail today for the complete facts.

Rome Manufacturing Company
Refrigeration Dept. • Rome N. Y., U. S. A.

ROME MFG. CO.
Gentlemen:—
The undersigned would like to learn the facts about Rome Full Automatic Refrigerating Machine.

____

tributed by the drivers. The large electric sig roof of the city distributing plant is also an a when illuminated at night can be seen for man by approaching motorists. Every wagon and kept spick and span by the washing departm rendering each of the more than 100 vehicles a tive moving advertisement.

A recent publicity stunt is the conducting o to the country plant. Two de luxe busses are c each day, and take from 50 to 60 housewives fr ous clubs on a day's outing. An hour's ride bri to the plant in Highland, Ill. A tour of the made under the direction of the publicity man great deal is said about the milk; however, the are explained very carefully. After the visi plant, they are conducted to the cafe and chicken dinner, with the compliments of the and then return to St. Louis. Here they are sh city distributing plant, quench their thirst wit of cold milk, and then embark for their homes that there is much truth in the slogan, "Highlan Milk."

Neal C. Davis, St. Louis architect, planned plant and the Meyer-Blanke Co., St. Louis, pla layout of the equipment and supervised its ins —The Cherry Circle.

UNITED STATES PRODUCED 52,000,000 LON OF MILK IN 1926.

In an address given by W. D. James of For son, Wis., at a convention of Northwestern sal the James Manufacturing Co., Mr. James sai country's milk production in 1926 amounted t 000 long tons." Mr. James stated further, as fo

"That's twice the weight of the pig iron p in the United States. To transport it would re the ships of the merchant marine of the Unite United Kingdom, France, Japan, Italy, Holl Sweden. In money it represents a value of $2, 000. The United States is the greatest gold p country in the world, but it would take our o the yellow metal for 55 years to pay for last yea production.

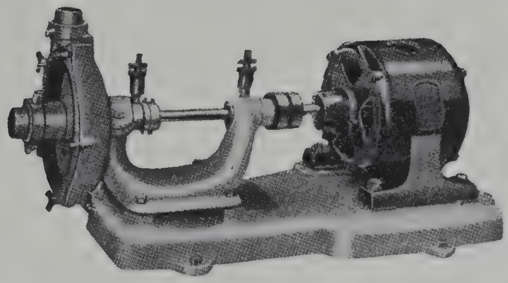
"We could pay off the entire public deb United States with interest, $20,500,000,000, in eight years, from farmers' milk and cream chec represent one-fourth of all the farm income in t try and supply one-fifth of the family food budg

CONNECTICUT MILK SHIPPED TO PROVI R. I., VIA TRUCK.

Because the amount of milk shipped to t Windham and New London counties has decreas 100,000 quarts daily to 25,000 quarts, dairy fa towns in eastern Connecticut are gradually aba railroads as a means of sending milk to Providen and Boston, Mass.

Figuring the freight at eight cents per 10-q to Providence and Boston, the trucks have ga equivalent of $800 per day in freight business.

Large trucks providing this service deliver chasers in Providence and bring back empty farmers, and during the summer do it at hou more agreeable to the farmers than those prov by the railroads when daylight saving time is i



Answer to a Vexing Pumping Problem —

Class "B" Sanitary MILK PUMPS!

**Enormous Capacity---A Really Sanitary Pump--- Simple in Construction---
Easily and Quickly Cleaned.**

Operates with minimum power. Thoroughly cleaned by simply removing two parts.

No opportunity for worn metal particles to combine with the liquid, thereby causing metallic flavors; there are no wearing parts.

The "Class B" is a long life pump and some have operated 20 hours a day for sixteen years.

All contact liquid parts made of BRONZE heavily tinned.

The Unique Simplicity of

PERFECTION ROTARY PUMPS

PERFECTION MFG.CO.

Sanitary Pump mounted on pedestal for individual motor drive.

THERE are only two moving parts in the Perfection Rotary Pumps,—the internal gear rotor and the idler pinion. The inter-meshing teeth in the rotor and pinion work like a series of pistons in cylinders.

The outstanding feature of the Perfection is the helical (spiral) cut of the teeth in the rotor and pinion. The teeth of the rotor "shear" through the liquid at the intake and discharge ports instead of striking the liquid column flat or head on, thus eliminating shock and vibration. The smooth running helical gears prevent excessive churning and deliver a uniform flow.

Perfection Sanitary Pumps are made in Iron or Bronze and are highly finished inside,—easy to keep sanitary. Bronze pumps nickel plated if desired. Capacities 8 to 90 gallons per minute. Mounted on base with with tight and loose pulleys or with reduction gears for individual motor drive or on pedestal like illustration. Industrial types for water or brine. Write for catalog and prices.

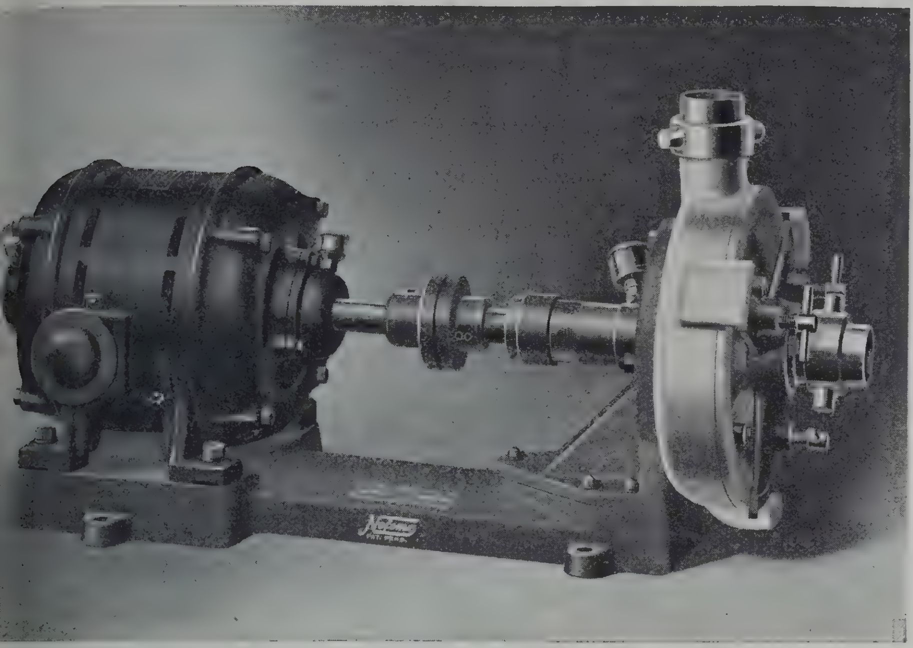
Superior Russell Creamery Company, 1627 Br
Superior, Wis., staged in the lobby of a local ban
exhibition attracted many favorable comments.

Nofome Sanitary Milk Pump



No churning, because the enclosed impeller carries the milk to full periphial speed without the vanes passing through the milk.

No foam because no air can enter the pump from shaft bearing, nor grease from the same source.

Milk passes through the impeller housing, but the vanes do not pass through the milk, which prevents churning and injury to the cream line.

Let us solve your Pump and Fitting Problems.

KENTUCKY DAIRY EDUCATIONAL TRA

A purebred sire train furnished by the L. & the L. H. & St. L. railroads through the courtes agricultural development department, visited tucky counties and made 52 stops from April 2 12, inclusive.

Agricultural trains and educational cars a new venture in Kentucky, but the attendance re the generous reception of the purebred sire sp exceeded any previous effort. Official attendanc show a total of 75,100 or an average of 1,444 visited.

In every county visited by the train, a pure was traded for a scrub bull with the exception

One-half of the crowd of 3,000 people who visite pure bred sire special at Lebanon, Ky.

county where a scrub bull could not be found this county was the first one in the United eradicate the scrub.

The train was sponsored by the Agricultu mittee of the Kentucky Bankers' Association doing so they also utilized the co-operation and of some 20 other agencies which have been promulgating the idea of bettering the dairy Kentucky.

It is felt that not only will the train be re the accomplishment of much good which wi directly on the farm, but it is also pointed out merchants and bankers of the communities vi come to a greater realization that agricultural is necessary, serious and a worth while cause. ing to advice received from Kentucky, comm cream is growing in popularity, but in the ma the rural towns it is still looked upon as noth than a Sunday dessert and possibly a summe the fountain. However, they do seem very cated concerning the misleading facts which h intensified by the negative advertising and the tive conduct of some indifferent, unscrupulous manufacturers.

This and the fact that pasteurized milk is able in most places and is looked upon in a so or superstition points out the need of well educational propaganda.

WHEN TO SCRAP DELIVERY TRUCK

(Continued from page 30)

"According to our way of reckoning, a li cylinder car that we use for city salesmen s good on an average of three years, and at th that time should be traded in on a new one. made rather exhaustive surveys of the subject a series of reports made by our department of i engineering, we have been able to apply stand to individual cars. These reports provide for t year trade-in policy—the period will, of cou with conditions of use."

Amortizing Trucks.

Every cost system, of course, if it is at all and trustworthy, allows for depreciation bas on years or mileage.

Different concerns depreciate trucks in ways. Nevertheless, it is advisable to set an mate length of service to be expected from eac and to charge off pro-rata each month until the investment is accounted for. Amortization (th for depreciation) is best calculated on a basis running from a usual minimum of 20,000 miles miles, depending on the quality of the vehicle kind of service.

If, at the time of a trade-in, the full invest not been charged off, the depreciation period underestimated or the truck has given poor se the vehicle has been charged off completely with amount of service still to be received, the amo course, considered as a profit in the business.

By keeping charts as mentioned above and s the illustration, it is possible to accurately tel investment from a poor one. Likewise, ex expenses due to poor handling on the part o can be detected and remedied.

Advice on "Trading-In."

There is always a tendency to scrap a truck turely or unwisely due to what appear to be u good trade-in allowances from truck dealers. A trying to sell a new truck with a policy of "long and an inflated price to make up for it, often m unusually high offer for an old truck on a trad

This, of course, is one of the biggest prob both the motor truck and passenger car industri trade allowances are misleading and often te owner to trade in his old machine at a good pri new truck that is really not such a bargain a The best advice that can be given on this subjec your first problem is to select equipment that w full dollar value by harmonizing with condition iar to your business. Consideration of this i mount. Forget your second-hand equipment moment, for its disposal is a problem all its ow an important problem, to be sure, but of second portance during the purchase of new equipment

The purchase of new equipment should not p contemplate the replacement of old, but if it d must carefully weigh the dollar value that is s in the old equipment or its component parts that of the new.

The purchase of new equipment must nec be considered from so many different angles th difficult to conceive of anything else occupyin mind during the transaction.

The purchase of new equipment is of paramo portance, the disposal of the old secondary. quire study and a knowledge not only of transp

ditions but of sales values as well. "Be sure you are right, then go ahead."

Scrapping Obsolete Trucks.

A truck which has become an "orphan" or an obsolete model may usually be scrapped to profitable advantage. As a truck becomes older it is necessary that parts should be immediately available. One owner expresses this well in the following statement:

"One of the big factors we found we had to take into consideration when we were simplifying our equipment was to select those types of cars that underwent the fewest engineering changes from year to year, and whose makers give good service on parts. This latter has been extremely important for with some of the makes that we have owned, it has occurred many times that a car has had to stand idle on the floor for several days waiting for some minor part which was expected at a moment from the factory. This kind of a situation is naturally very expensive as our net loss on a car standing idle is in the neighborhood of $15 a day."

In buying a truck, likewise, the trade-in value at the time of turning-in should be considered. There is a great difference in the "book value" of different makes of trucks of the same age and original price and this difference is generally based on the popularity of the make and its reputation for quality.

Avoid, by all means, the possibility of having an "orphan" or an obsolete model on your hands at the time of a resale. It means hundreds of dollars of difference in the actual price obtained.

When to Scrap Tires.

The replacement of solid tires when necessary should not be neglected. A great deal of damage may be inflicted upon the vehicle when the tires have been worn to a point where they have very little cushioning quality. Ordinarily, a solid tire should be replaced when it has been worn down to within an inch of the steel base. It must also be remembered that the condition of the rubber in a solid tire has a great effect upon the tire's resiliency and that even though it may be two or three inches in thickness, it may need replacement.

It is a good idea to occasionally interchange rear tires with front ones. The rear tires, being the driving and braking tries, naturally are subject to the greater abuse, and by interchanging them with the front tires, their mileage life will be considerably lengthened. Changing tires from one side to the other is also a practical method of increasing the service obtained from them as those on the right-hand side are usuall
ered to be subject to the greater strain.

"Breaking-In" a New Truck.

And remember that when you do trade in
truck for a new one, some provision must be
that the new truck gets the right start towar
mileage life.

The bearings and all working parts of a ne
are fitted sufficiently snug to prevent them fro
ing loose, until they have adjusted themselves.
fore, the driver should exercise care and good j
in driving the new truck by avoiding the full-g
speed and hard going for the first two hundred

The working-in of the engine and all new
parts is entirely in the hands of the operator.
care and sufficient lubrication during the wo
period will repay the owner well after the tr
"found" itself.

It is a good practice to pour one quart of goo
cating oil into the gasoline tank with every five
of gasoline during the first 500 miles. This will
lubricate the piston rings while they are wor
and will give more mileage to the gallon.

Inspect and tighten all nuts frequently (es
those on the spring clips) during the breaking-i
All nuts are thoroughly tightened at the fact
while the spring leaves are settling, the sprin
have a tendency to work loose.

MISSOURI
DAIRY

$3.25 Each
Less In Quantities

Put Your Men In ALLOVA UNIFORMS at Wholesale Cost!

Allova Work Suits, Work Coats and Caps are made of eight-ounce cloths, closely woven, and stronger, heavier, longer wearing! In order to guard against the inevitable shrinkage, we cut all garments oversize, and make them two inches longer than ordinary work clothes.

Snappy uniforms, lettered with the individual name, trademark or monogram of the wearer, give an air of "class" to any place of business—and yet cost but little more than nondescript, shabby overalls.

Every seam is stitched to stay. Pockets reinforced with double thickness of material. All buttons covered. Your choice of many colors: Solid blue; solid white; solid khaki; blue and white striped; blue and khaki striped. Sizes 34 to 56.

Improve your milk
. . . at the farm!

Sell farmers and dairymen these two filtering aids. Our advertising will help

MILK should be filtered *before* it reaches the pail—to catch the bacteria-laden dirt particles before the bacteria have a chance to do harm. That is the verdict of authorities.

Farmers and dairymen everywhere are learning this fact from our advertising—learning to stretch a J & J Filter Cloth over the pail at milking time—and to use J & J Cotton Discs in their strainers.

Sell these aids to *your* supply men. Make sure that your milk is of higher quality before it leaves the farm. Often this precaution will make a real difference in the grading of your milk.

We also make Filter Cloths on order to fit the various machines on the market. All three of these products are chemically pure and aseptic. Write direct to us for prices and free samples.

WASHINGTON — MAINE

Notes From Far and Near

CALIFORNIA — FLORIDA

Pawhauska, Okla.—Lee Hopkins has purchased the former Whipkey Dairy and has added it to his dairy herd.

Malvern, Ark.—J. F. and T. C. Guerin have purchased the Charles S. Smith property in this city and will open a dairy there.

Tulsa, Okla.—Tulsa Dairy Products Company has been chartered with a capital stock of $24,000 by P. E. Estill and others.

Bonifay, Fla.—The Bonifay Dairy, of which C. A. Melvin is proprietor, has purchased the J. T. Byrd dairy herd.

Wills Point, Tex.—The Sanitary Dairy barn here was destroyed by fire recently with a loss of $8,000, partially covered by insurance.

Barron, Wis.—The whole milk supply has already outgrown the capacity of the new whole milk plant of the Barron Co-operative Creamery here. A month ago a new dryer was installed in addition to the first one and it was thought that would take care of the whole milk for some time to come. For the month of April patrons of the whole milk and butter departments were paid $87,733.87.

Madison, Wis.—The board of health recently announced a new ruling, effective January 1, 1928, under the terms of which all milk delivered in the city must be either pasteurized or certified. More than 23,000 quarts of milk were delivered to Madison homes each day during the past year, an increase of more than 9,000 quarts since 1920.

Manitowoc, Wis.—Articles of organization of the Osman Co-operative Dairy Association Company, listing the capital stock of the corporation at $10,000, were filed with the register of deeds recently.

Atlanta, Ga.—It is reported that Columbus Roberts, president of the Coca-Cola Bottling Co., 12th St. and Sixth Ave., Columbus, Ga., has purchased the pasteurizing plant and delivery equipment of the Georgia Dairies, Inc., located at 198 S. Forsyth St., this city. He will remodel the same to handle 400 gallons of milk daily. The company will be known as the Georgia Dairy Co.

Hazard, Ky.—The Bluegrass Milk Co. has been incorporated here with a capital of $8,000. J. D. Smith, Curtis Lucas, and W. C. Smith are the incorporators.

Greeneville, Tenn.—With Will Kiser as head of the condensery committee, directed by the Chamber of Commerce, and assisted by County Agent Vickers, plans are being made to get in touch with the farmers of each district. The condensery demands that the farmers furnish 50,000 pounds of milk daily.

Chester, Pa.—The commissioners of Upper Darby township, in a special session held in the municipal building, Upper Darby, recently, passed a resolution adopting a lengthy milk ordinance as prepared by the board of health and presented to the commissioners for approval. The township heretofore has had no form of legislation governing the methods of distribution and sanitary features of milk in this section, and this ordinance, according to Cyrus F. president of the board, is a necessity in the protectio dents of the community.

Fairmount, Ind.—Fire recently destroyed the la buildings owned by Emory Adams, near here, doing a estimated at from $4,000 to $5,000. The loss wa covered by insurance.

Moundsville, W. Va.—Dairymen of Marshall co invited to inspect a model steam sterilizer for sterili bottles and utensils, which is on display at the County health office on Sixth Street.

Los Angeles, Cal.—Milk shipped across the from Los Angeles to Washington, D. C., scored 99.3 perfect in the national milk scoring contest after it days old. Arden Certified Dairy, this city, entered which defeated 30 other certified milk entrants repr dairies all over the country. The American Assoc Medical Milk Commissioners sponsored the contest.

Washington, D. C.—The report of the bureau of tural economics of the United States Department of ture shows the "average American" drank nearly more milk last year than he drank in 1920.

Huntington, W. Va.—Federal co-operation has sured the city when the new full-time milk and spector takes charge on July 1. The plans sugges for a thorough inspection of every dairy in the working out with the dairyman conditions that will the product as well as benefit the producer. Miss E Moore is the inspector.

Eugene, Ore.—Two consolidations of dairies s Eugene with milk have taken place here. The "Do dairy, an establishment founded by J. W. Swope near field, to produce fancy milk, is now being conducte similar lines by the Wild Rose Stock Farm, the "Do herd of Guernseys having been moved to the new a ern barn on the Wild Rose farm. C. B. Swango is t ager. The other consolidation was that of the dai ated by J. A. Neher of Springfield, whose retail mi ness was purchased by W. H. Stout, proprietor of the side" and "Norkenzie" dairies.

Belleville, Ill.—The A. and L. White Lily Dairy h incorporated here at 1613 W. Main St., this city, wit ital of $5,000. The dairy will distribute and sell m dairy products of all kinds. The incorporators are Abend, Charles Abend, Wilmer Liebig and Homer Lie

Monticello, Wis.—The Monticello Dooly Dai changed hands and is now the property of John C. The dairy was previously owned by James Dooly. Th ness will now be run under the name of Elmer's Brow Dairy.

Santa Monica, Cal.—The Santa Monica Dairy Co this city, was awarded second place with a score of a result of a milk scoring contest held in conjuncti the Certified Milk Producers' Association of the Unite and Canada which held its annual convention at Wash D. C.

Martinsburg, W. Va.—Dr. C. W. Larson, chief Federal Bureau of Dairy Industry, said that indicati that there will be an increase in the milk produc southern New Mexico, Arizona and the Imperial Va the near future.

Dayton, O.—The very latest equipment for paste milk has been installed recently in the plant of The

Leffel CREAMERY BOILERS

Save Time Labor Fuel

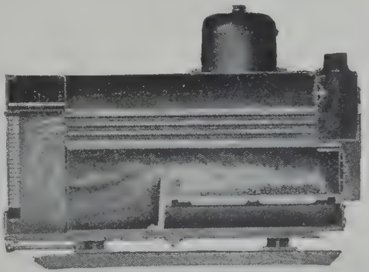
A tremendous saving in fuel costs at your plant, can be effected by using Leffel Creamery Boilers, because they get double service from every pound of coal used.

The hot gases are **compelled** to travel twice the length of the boiler through water surrounded passageways.

Even the ash pit is surrounded by water, thus utilizing every possible heat unit to produce steam.

Because of this highly efficient application of heat, owners save 30 to 50% in fuel costs.

In all sizes 6 to 150 H.P.—workmanship and quality guaranteed—will meet all state boiler laws.



Full description and prices on request.

The James Leffel & Co. BOX 330
SPRINGFIELD,
OHIO, U. S. A.

3

Products Co. at 219 E. Fifth Street, this city. The new equipment has an output of 1,200 quarts of pasteurized milk an hour. The Dairy Products Company was the first organization of its kind in Dayton, and has kept progressing through the ability of President John N. Gibson to anticipate future needs. Today this plant stands, and is widely recognized, as the most complete dairy plant in the country.

Gary, Ind.—The Bowman Dairy Company, an Illinois corporation, has been incorporated here to conduct a general dairy business, with a capital of $54,000.

Martins Ferry, O.—A new bottling house has just been completed at the Golden Guernsey dairy farm of Roy S. Smith & Sons on North Sugar St., this city. The new structure has windows on all sides and along the western exposure is a device in which milk bottles are hung for purification by the sun after they have been washed.

Pittsburgh, Pa.—The Dearborn Dairy Company has been incorporated here with a capital of $10,000. Henry P. Lotz, treasurer; John Lotz and William Lotz are the interested parties.

La Grande, Ore.—Members of the La Grande Realty Board have as their program to increase better dairying in Union county three or four times its present scope.

Eatonton, Ga.—T. H. Strange, well known man of the county, has gone into the dairy business. While as yet his herd is not a large one, he is entering the business with pure-bred registered cows.

Klamath Falls, Ore.—That this city is immediately faced with the problem of providing an inspector and a car to handle dairy sanitation work for this section, became apparent at the city council meeting held recently when Dr. E. D. Lamb, deputy state dairy and food commissioner for this district, appeared before the council with a startling statement as to existing dairy conditions. Dr. Lamb told the council that four dairies had been closed because they failed to come up to the standard set by the state for dairy operatives.

Winstom Salem, N. C.—The Southern Dairies, Inc., of Washington, D. C., have taken over the Forsyth Dairy Company of this city, according to information received recently. The Carolina Creamery of Asheville is also concerned in the merger. The Southern Dairies, Inc., have a number of branches throughout Virginia, North Carolina and other states.

Morgantown, N. C.—John M. Mull of Morgantown has opened a dairy on his farm near Lake James, starting the enterprise with 42 thoroughbred Jersey cows. It is the plan of Mr. Mull to supply Morgantown and surrounding towns with milk and cream daily.

Benton Harbor, Mich.—When the large new daylight addition to the plant of the Producers' Creamery Company, this city, opens in July, the twin city public need have no worry as to either purity or supply of milk for the new machinery that has been installed will bottle 43,200 quarts of pasteurized milk in a 12-hour working day.

Bartow, Fla.—Dexter Summerlin has started a dairy business with his farm east of this city. "Quality is what I am striving for," he said.

Janesville, Wis.—A surplus supply of milk, in order that a sufficient quantity will be available during the low point of production during August, September and October, is being purchased by the Bowman Dairy Company throughout this section and is being shipped through the Janesville creamery.

Waukesha, Wis.—The contract for the construction of the Wisconsin Sterile Milk Company building was let recently and construction will begin in a few days, according
to the Association of Commerce which has been instr
in bringing to this city the new milk plant, backe
organization incorporated for $100,000.

Santa Paula, Cal.—A fine new and up-to-date coo
bottling plant has been installed by Harold and Erne
ardson, proprietors of the South Mountain Dairy. T
is to be made a model of sanitation and cleanliness.

Cincinnati, O.—The Norwood Dairy Products
will become the buying company for the Louis Kae
Dairy Company, Norwood. The company applied for
ter with 100 shares of no par value stock. Louis, He
Amelia Kaesemeyer, Violet Crail, Harry E. Engelha
A. C. Shattuck are the incorporators.

Toledo, O.—The Ohio-Clover Leaf Dairy Co.,
large milk and cream distributing plant at 1820-24
Avenue, is the largest distributor of dairy product
home in this city, according to the officers.

Columbus, O.—Incorporation of the Tip Top Dai
Dayton, with capitalization of $50,000, was perfec
recently. The incorporators of the new concern ar
J. Reichert, former owner and manager of the
Hotel, Dayton; Adam D. Steele, Ida E. Steele, E
Steele, Ida E. Reichert and Mary E. Kerber.

Grand Rapids, Mich.—The purpose of the newly
Milk and Milk Products Research Bureau, which
headquarters here, is to establish bureaus of resear
cation and general information for the public's
throughout the United States and Canada. W. H.
the managing director.

Sherman, Tex.—Through the establishing of
cream market here for Grayson county farmers by
deker Ice Cream Company, dairying in the count
pected to be increased and become more profitable
opinion of H. F. Boedeker, member of the firm from

Brooklyn, N. Y.—The new distributing station
1689 Sixty-second Street, of the M. H. Danken Dai
pany, has the most modern equipment to insure sanit
distribution of milk and milk products.

Bloomer, Ark.—A. T. Crouch was able to see
future of dairying and this vision has now led him
enterprise that keeps a score of people busy oper
creamery and nine trucks on the road hauling cream

Sacramento, Calif.—California is inaugurating a

A uniform medium containing ingredients in proportions stipulated in "Standard Methods."

Invaluable in milk control for the collection of comparative bacteriological data over long periods of time.

Bacto-Nutrient Agar, Dehydrated, has been recommended by the Laboratory Section of the American Public Health Association as allowable in "Standard Methods" of Milk Analysis.

To use dissolve 23 grams in a liter of water and sterilize. No adjustment of reaction or filtration.

The Arcus Ticket Company
350 N. Ashland Avenue CHICAGO, ILL.

milk, has been organized here with a capitalization of $100,000.

North Costa Mesa, Calif.—Earl Patterson is constructing buildings here at 22nd and Santa Ana Avenue for the operation of the Newport Creamery. Mr. Patterson is the owner of the Santa Ana Creamery.

Tacoma, Wash.—Plans for an entirely new and complete electrically equipped plant of the Producers Dairy, this city, are being made and work will be started within the next two or three months.

Menomonie, Wis.—It is expected that the Nestles Food Company will begin receiving milk at its condensery, June 15, according to M. C. Reppen, district field manager.

Kansas City, Kans.—The Milk Producers' Association has an approximate membership of 100, who desire to systematize the sale and distribution of milk in the Kansas City market.

Canton, O.—The Universal Dairy Company has been incorporated here with a capital of 500 shares, common, no par value, and $50,000 preferred. W. A. Pittenger, H. I. Pittenger, R. S. White, M. E. White and W. R. Thackwell are the interested parties.

Standish, Mich.—The Freeman Dairy Company, of Flint, Mich., has purchased the Standish Milk Plant.

Belvedere Gardens, Calif.—A surprise milk scoring contest has just been completed in the Huntington Park-Belvedere district of the Los Angeles County Health Department. As a result of the contest a rating of 94.8 per cent was given the district, which is an increase of 2.4 points over the last contest in the district which was held in December, 1925.

Newark, N. J.—Bordens Farm Products Co., Inc., are the owners of the new pasteurizing plant which is being erected at Orange and Nesbitt Sts., this city. The architects estimate the building will cost $1,000,000.

Morristown, Pa.—After being affiliated with the Penn Dairies for the last year, the Baumgart Dairies, known for the last generation as one of the outstanding milk dealers in this section, is again doing business independently, according to a recent announcement.

Covington, Ky.—Summe & Ratterman have a permit to erect a $20,000 milk depot in the rear of 219 E. Nineteenth St. The building will be of brick and concrete.

Easton, Md.—The mayor of this city has reported that the city is planning the building of a $30,000 milk cooling station.

Indianapolis, Ind.—Articles of incorporation were filed recently with the secretary of state by the Indianapolis Dairy Club, a new organization for men engaged in the dairy business. The purpose is to get men of the dairy business together to discuss matters of mutual interest, according to Mr. Carey, treasurer.

Wheeling, W. Va.—Dr. D. Berman of the Marshall county health unit, is finishing plans for the testing of all milk brought into the city, by means of the new bacteriological testing process recently purchased by the city council.

Cudahy, Calif.—A new dairy company has located here, under the name of Spencer's Dairy Company, to deal in milk, cream, butter, buttermilk and pure food products at 925 Cecelia St. Vivian M. Spencer, residing at 215 Prospect Ave., Bell, Calif., is the sole owner of the business.

Canton, O.—O. E. Barkey, manager of the Canton Pure Milk Company this city, states that at the present time the concern is distributing 25,000 pounds, or approximately 2,100 gallons, of milk every day.

Washington D. C.—The Interstate Commerce Commission, in a decision rendered in Investigation and Suspension Docket
No. 2653, Milk and Cream Between New England Poi
held that the increase of 20 per cent proposed by
roads on shipments from New England points and fro
in New York to points in New England, was not
except for distances up to 100 miles.

Columbus, O.—According to data collected by
cians, Ohioans spend approximately $1,200,000 dail
state's 13,000 restaurants, and from one-tenth to
of it goes for dairy products, which include milk,
butter and ice cream.

Seattle, Wash.—Through the activity of the Roya
5428 Leary St., this city is now shipping 400 gallons
to Manila every two weeks for human consumptio
product, according to F. R. Schain, manager of th
Dairy, is pasteurized and shipped in the refrigeration
ment of the steamer. When it arrives at its destin
is said to be in as perfect condition as on the day of s

Akron, O.—The Akron Pure Milk Co. has purcha
Ewart Dairy Co. of Cuyahoga Falls, it was learned, f
filing of a deed conveying the property on Northamp
to the Akron company.

Spokane, Wash.—W. V. Robb, manager of the
division of the Western Dairy Products Company,
announced the sale of its milk, cream, buttermilk, co
milk, and ice cream business in Idaho and Montan
Broadview Dairy Company of this city.

Madison, Wis.—Improvement in the nation's mil
will follow a more common use of the practice of gra
of purchasing milk and cream according to its g
quality, E. H. Farrington, head of the dairy depart
the University of Wisconsin, points out in his ne
"Quality in Dairy Products."

Minneapolis, Minn.—Alden W. Elwell, vice-presi
the Northland Milk & Ice Cream Co., died at his hom
Come Ave. S. E., after an illness of three months.
39 years of age.

Miami, Fla.—Work has been started on the new
home of the June Dairy Products Co., Inc., which
located at 1773 N. W. Seventh Ave., this city. It is
to be ready for occupancy by July 1.

Toledo, O.—The Tindall Dairy has just installed
cally new equipment throughout, and is now prepare
liver either raw or pasteurized milk.

Tyler, Tex.—Geo. Wilhams, proprietor of the
Dairy, which suffered a loss on account of fire, estima
loss to be about $8,000. The fire is said to have start
an improperly insulated electric wire.

Dayton, O.—The Tip Top Dairy Co. has been incor
here for $50,000. Frank J. Reichert is the owner.

Improve Your Buttermilk with

ESSEX GELATINE

YOUR buttermilk will be improved by the wonderfully smooth and creamy flavor. It softens the curd, retards excessive acid flavor, prevents wheying-off, and imparts a new and delicious smoothness that will quickly increase your buttermilk sales.

For many years Essex Gelatine has been used in the highest grades of ice cream for body and velvety smoothness. You too can now take advantage of this stabilizer for your natural or cultured buttermilk.

Essex Gelatine is economical, you would use only 2 pounds in 100 gallons for a marked improvement. Write for working sample, instructions and prices.

CONTROL OF MILK SUPPLY STRESSED IN NEW JERSEY PUBLIC HEALTH COURSE.

From June 28 to August 4, a course in public health administration is given at Rutgers University Summer School, New Brunswick, N. J. Not alone are the subjects of epidemiology, vital statistics, public health law, bacteriology of communicable diseases and general sanitation discussed but a considerable period is devoted to milk and its products.

Beginning with sanitation in the production of milk at the farm until the milk reaches the consumer either in the fluid state or in the form of by-products, every phase of this important food is discussed. Besides the lectures and quiz periods, several hours are set aside for visits to model dairies, pasteurizing plants, certified dairies, ice cream plants and restaurants. Prospective health officers and sanitary inspectors are expected to have an intimate working knowledge of dairy control matters, as this part of sanitary science in New Jersey demands their frequent attention.

The lectures and field demonstrations in milk control are under the direction of A. I. Goehrig, special investigator of milk products, New Jersey Department of Health; also a member of the examining board for health officers and sanitary inspectors.

⁂

68 YEARS YOUNG.

In a recent letter our good friend E. R. Leighton of the Milk Dealers' Supply Co., Lawrence, Mass., lays claim to being the oldest dairy supply salesman in New England. He says "I am 68 years young with 34 years experience, first selling the milk man his milk cans, and old one and two quart measures, and later the old Fidelity milk bottles and caps. Always a booster for everything of interest to the milk man. Right here I wish to say the average milk man is the reddest blooded, he man in the good old U. S. A. and I will bet a box of cigars that Lindbergh has helped some milk dealer in old Minnesota."

⁂

NEW FORM OF MALTED MILK INTRODUCED.

Malted milk mints, a delicious confection, is being produced by the Kraft Cheese Company at Plymouth, Wis. The mints have proven an instant success. It is said that the buyer "goes after them as a hungry trout after an angle worm."

REPORT OF CONSOLIDATED DAIRY PROD COMPANY.

Consolidated Dairy Products Company, Nev
City, reports sales of $652,200 in 1926, as compar
$180,580 in 1924, an increase of 261 per cent over
year period. It estimates that sales for 1927 w
$1,300,000.

:NG ON A SUCCESSFUL MILK EXHIBIT.

(Continued from page 23)

ɔut that only harmless and beneficial germs are n milk that has been carefully handled and then :ed.

ıs also made plain that certain germs, should into milk, are very dangerous and should be at any cost. This can be done by rigid cleanli- prompt cooling of the milk after it is drawn, diligent care of the health of the cow and the ıdler. Pasteurization was illustrated and the .de that when done all disease-producing germs l.

ed to the idea of cleanliness was the demonstra- couple of flies mounted on a card board so that ɔer and under sides would show under a special us, binocular microscope. This apparatus is n the table at the extreme left just in front of that reads "The Dirty Fly." Every minute of one heard "Oh's" and "Ah's" and "Oh come the flies." Every one seemed impressed with that the fly is really a horrid creature, and s resolved to keep them out of the milk.

lletin machine displayed twelve catchy health each with an appropriate cartoon cleverly done by Mr. Iske. The only trouble with this ar- nt was that folks wanted to wait and see what em said and this sometimes tied up the proces- ıe quips on the cards were as follows:

nk creamy milk and rise to the top."
n the window and throw out your chest."
ou digest well you won't die jest yet."
ep in bed but not in your shoes."
spinach and own your own iron range."
your rouge of the vegetable man."
cabbage and come out ahead."
ı't be afraid to bathe. You won't shrink."
ke the cow one of the family."
it with cauliflowers."

ıe end of the booth that does not show were particularly interesting things. One of them y steam engine which was run by the heat of butter. There seemed to be no way of burning ilk as was done in such a spectacular way by desen of Chicago so butter was used instead. ine clicked right along though it smoked quite ome folks thought it was run by a hidden elec- or, but they were all wrong. It was a real steam hat used water in a boiler heated with butter, urned many awkward fingers that needed occa- to adjust it.

her feature not shown was a comparison of the ıe of a glass of milk with other common foods. sat on a little shelf and its food equivalents in ɔotatoes, eggs, meat, sugar, beans, apples and aples indicated below with the actual food on

llon of milk had been analyzed and its content of rotein, fat, milk sugar, and ash shown in bottles able. From each bottle a ribbon led to a beauti- lored poster describing the use in the body of ticular ingredient indicated. Folks who had study of the matter were greatly surprised to t there was so much protein, sugar and ash in t was clear that they were convinced that milk l to be eaten and not merely a beverage to tickle ıte.

Use
BOVINOL
REG. U.S. PAT. OFF.
and Stop the Unequal Fight

your cows must wage against flies. A cow has only a switching tail for a weapon to keep flies from stinging. Fighting the unequal battle for quiet and comfort, the cow wastes energy—equivalent to the food value of a pound of oats per head per day! Scientists have made that estimate.

What is the result of this waste to farmers and dairymen? Financial losses. During very severe outbreaks of flies, it has been estimated that milk production was reduced by 40 to 60 per cent, while the rate of fattening was reduced almost as much.

STANDARD OIL COMPANY
SERVICE
(INDIANA)
STANDARD OIL COMPANY
(INDIANA)

Spray your cows with Bovinol and prevent such losses. Flies may settle on a cow that has been sprayed with Bovinol—but they cannot sting! Bovinol is harmless—contains no poisonous elements. It is odorless, tasteless, and stainless.

Apply Bovinol with the compressed air type of sprayer in which the oil is forced out by air pressure and is further atomized by an air blast. Spray against the direction of the hair, so that Bovinol will penetrate the coat, and be sure that every square inch of the hide is covered. It requires less than a minute to spray one cow.

Agricultural experiments and practical dairy tests have shown that a consistent use of Bovinol will increase milk production at least 10%!

Spray your cows morning and evening with Bovinol.

DAIRY SCIENCE ASSOCIATION TO MEET JUNE 22, 23, 24, 1927.

The annual meeting of the Dairy Science Association is scheduled for June 22, 23, 24, 1927, at East Lansing, Mich. The summer meeting is an experiment and officials of the association express the hope that the three days given over to the meeting, without interference with other activities, will make it possible to have a real gathering. Members are urged to attend and the department of dairy husbandry of the Michigan State College has completed plans to help make the meeting a success. It is announced that the best program ever offered to the members has been prepared.

In addition to the regular program the local members have made plans for a general get-together on Wednesday evening at 8 o'clock, at the Woman's Building. On Thursday evening the entertainment will consist of a "fish fry" at Pine Lake. Plenty of time will be available for a swim and other forms of recreation at this time.

Arrangements have been made to house the guests in the Woman's Dormitory. Charges for this will be $1.00 per person, per day. Those who desire hotel accommodations should make their reservations at Hotel Olds, Lansing, Michigan.

Golf fans, tennis sharks, and Ananias fishermen will be given an opportunity to show "their stuff" in Michigan—the sportsman's paradise.

The ladies are also cordially invited to attend the meeting. Arrangements will be made for their entertainment.

PROGRAM.

President J. B. Fitch, Presiding.

9:30 A. M.—Opening Remarks, Dean R. S. Shaw.
Announcements, President J. B. Fitch.

10:00-11:00 A. M.—"Vocational Teaching," Dean Phelan, Educational Dept., Mich. Agr. College.

11:00-11:40 A. M.—"Importance of the Fundamentals in Dairy Instruction," J. M. Sherman, Cornell University.

1:30-2:20 P. M.—"Teaching Cattle Breeding," W. W. Yapp, University of Illinois.

2:20-3:00 P. M.—"Fitting Our Curriculum to Meet the Demands of Industry," H. A. Ruehe, Univ. of Illinois.

3:00-3:40 P. M.—"The First Course in Dairying. What it Should Contain and How it Should be Taught," H. P. Davis, University of Nebraska.

3:40 P. M.—Demonstration of Experimental Work in Progress at Michigan Experiment Station, O. E. Reed, C. F. Huffman.

Thursday, June 23—Research Program.

J. M. Sherman, Vice-President, Presiding.

9:30-9:45 A. M.—"The Possibility of Producing Iodized Milk, a Progress Report of the Study of the Iodine Content of Milk as Affected by Feeding Iodine," C. F. Monroe, Ohio Experiment Station.

9:45-10:00 A. M.—"The Effect of High and Low Protein Diets on Growth and Development of the Internal Organs," S. W. Mead, University of California.

10:00-10:15 A. M.—"High and Low Protein Rations," A. E. Perkins, Ohio Experiment Station.

10:15-10:30 A. M.—"The Economic Effect of Contagious Abortion," R. F. Morgan, University of Nebraska.

10:30-10:45 A. M.—"Chemical Sterilization in the Dairy Industry," M. J. Prucha, J. M. Brannon, Univ. of Illinois.

10:45-11:00 A. M.—"The Food Value of Milk as Affected by Rations. The Effect of Widely Differing Rations on the Vitamine Content of Milk," W. E. Krauss, Ohio Experiment Station.

11:00-11:15 A. M.—"The Adaptation of the MacDonad Process for the Removal of Onion Odor and Flavor in Milk to Creamery Practice," C. E. Wylie, Univ. of Tennessee.

11:15-11:30 A. M.—"Recent Results Concerning Vita
Requirements for Calves," S. I. Bechdel, State
Pennsylvania.

11:30-11:45 A. M.—"Recent Development in Calciu
Phosphorus Metabolism," C. F. Huffman, Mich. E

11:45-12:00 M.—"The Effect of Butterfat on Overr
Quality," P. S. Lucas, Michigan Experiment Stat

1:30-1:45 P. M.—"Sugar in Ice Cream," W. N. Marti
sas Experiment Station.

1:45-2:00 P. M.—"Research Problems in Dairy Pro
on the Pacific Coast," W. M. Regan, Univ. of Cal

NOTES OF THE TRADE

News of Interest Concerning What Our Readers and Advertisers are Doing
to Develop the Industry. We Invite Correspondence Relative
to New Products and New Equipment.

A GASOLINE TRUCK ESPECIALLY FOR DELIVERY OF MILK.

For the first time in the history of the automotive industry, a gasoline-operated motor truck is being built especially for the retail delivery of milk. It was designed by creamery men for their own use, and embodies many revolutionary time-saving and money saving features heretofore unheard of in house-to-house and store-to-store delivery vehicles. The new truck (Divco) is being manufactured by the Divco-Detroit Corporation, a newly organized company, 2435 Merrick at Sixteenth St., Detroit.

A compilation of the results obtained by many of the representative plants using Divco trucks showed that Divco had reduced delivery costs to ten cents a mile. This remarkably low figure included everything—operation, maintenance and fixed costs. In comparison with the other delivery vehicles used (horse and wagon, electrics, and various conventional trucks) Divco saved on an average more than 33 per cent for every mile it operated. The saving in time ranged between one and two hours for every route. The milk routes over which the results were obtained varied from 10 to 50 miles, and from 135 to 350 stops.

Perhaps the most sensational of the many time-saving features is its patented three-point control. With this simple arrangement of driving controls, the driver can start, operate, and stop the truck from either running board or from the front seat—a convenience which saves time and many stops for the delivery man.

Another important convenience is its unusually accessible body; it may be loaded and unloaded from either side the front or rear. Ample room is provided for 45 cases—twice the carrying capacity of the horse-drawn The body is also dust-proof and insulated, thus a clean, fresh milk under all weather conditions. This w proof body likewise provides complete protection driver, all three sets of controls being enclosed.

Other unique features designed to save time and m multiple-stop delivery are its patented "controlled ho carburetor which cuts gasoline consumption in half; its oil filter which purifies the oil every 30 minutes and it necessary to change oil but twice a year; and its safety brake which se an automatic stop Divco is in motion.

It is as quiet as an and its heavy dut speed, spring suspend tor, governed to 18 m hour (1,400 R. P. M.) and vibrationless. makes for long life a maintenance costs, a the sturdy oversize the full ball bearing mission, the special n the counter balanced shaft, and other oversize parts.

Divco is a real b the solution of traffi gestion problems. Ha wheelbase of only 86 it turns around in a street or on an averag four-foot smaller circl a Ford. In traffic it re but half the space required for a horse and wagon. The omy of storage space is even greater, three Divcos occ no more space than one horse and wagon.

Names prominent in automotive and financial circl pear on the directorate of the Divco-Detroit Corpo Carl H. F. L. Flinterman, who was for several years pre of the Detroit Pressed Steel Company, and now heavily ested in automotive companies, including the Flint Corporation, is president. C. R. Norton (inset), fo years general sales manager of the Packard Motor Car pany of Detroit, is directing vice-president. G. M. who promoted and developed the Detroit Electric "An Carriage," and who conceived the idea of a three-poin trol to reduce delivery costs, is another vice-president. M. Ferguson, Divco chief engineer, was formerly chi gineer of Studebaker and later consulting engineer fo General Motors Corporation.

CHANGES IN THE BARBER-GOODHUE ORGANIZATION.

Announcement is made of an enlargement of the board of directors of A. H. Barker-Goodhue Company, by which the directorate is increased from three to seven.

At a special stockholders' meeting, held on March 26, the following men were added to the board: H. H. King, T. K. Johansen, E. L. Slayton, L. H. Barber. These men, in addition to the old board consisting of A. H. Barber, P. C. Barber and H. S. Fielder, constitute the entire board. The officers are as follows: A. H. Barber, president; E. L. Slayton, vice-president; P. C. Barber, treasurer; H. S. Fielder, secretary.

Mr. Slayton has had active experience in the sales department for the last ten years; he has a wide acquaintance among ice cream manufacturers, milk dealers and large creamery operators. In addition to his general sales duties he has active charge of the ice cream department.

Mr. Fiedler has had a long identification with the pany both in the capacity of sales and engineering. cent years his work has been entirely in the engineeri partment, where he was closely associated with Mr. Goo After the death of Mr. Goodhue, Mr. Fielder was made of the engineering department and continues in that ca

Mr. King has been identified with the company more 20 years; he is purchasing agent and director of supply

Mr. Johansen has been with the company all of 15 and has been principally identified with Chicago sale continues in that capacity and as director of sales of B Simplex long distance flow pasteurizers.

L. H. Barber is not actively identified with the co as his time is devoted to A. H. Barber & Company, who cheese dealers; he is the secretary of that company.

These changes place added responsibility upon these long been identified with the company and who ributed to its success.

GLIABUE MFG. CO. HAS OPENED NEW BRANCH FACTORY.

. J. Tagliabue Mfg. Co. of Brooklyn, N. Y., makers rial instruments, has opened a branch factory at negie Ave., Cleveland, the recent growth of the iness in that region having made it necessary to a branch factory there.

rice function of the new factory will be repair work, ial attention to emergency orders. The Cleveland ill be prepared to fill emergency orders for standard eters both of the industrial and laboratory type, ers and kindred instruments, oil testing instru- nd other laboratory supplies, standard recording eters and recording pressure gages, standard auto- ntrollers for temperature and pressure and various sses of instruments.

actory is in charge of the district manager, A. R.

* * *

THE "PAK-AGE-CAR."

Dobbin," who has consistently maintained a promi- sition in the house to house milk delivery field ut the motor age, is now confronted with a new Pak-Age-Car. The vehicle, designed and built to the horse in the work where he has proved most efficient, exhibited for the first time, is made by the Package Car Corporation, Union Stock Yards, Chicago. Factory offices for national sales and distribution have been opened at 1923 South Michigan Avenue, in charge of Albert A. Lau, general sales manager.

Through two years of ruthless testing on Chicago milk routes the car has shown itself capable oming all weather obstacles, and has established a upkeep record unrivaled by the horse-drawn vehicle to house delivery.

gasoline consumption is one quart per hour of run- approximately 40 to 60 miles per gallon straight Oil consumption is one quart per week.

ppearance, the car resembles an underslung wagon. ors, extending from floor to roof, permit easy en- rom either side. There are no built-in seats.

re control is vested in dual levers, one beside each it can be operated from either side. A steering wheel enter is adjusted to the standing posture. An auto- lutch permits shifting of gears without use of foot The shifting lever, when pulled back, operates the The car is accelerated by turning the handle, the used on motorcycles.

Truck Has No Chassis.

re is no chassis. The enclosed body is supported by a al truss that extends along the roof from front to t has no axles. The front supporting springs, mount- swise, one above the other, terminate in ball and connections which replace the usual king-pin construc-

power plant is one of its most startling features. ine and all of its accessories, clutch, transmission and orm drive are all assembled in a unit with the rear and wheels. In case of emergency, this entire unit replaced on the road, without disturbing the load, in minutes.

twin-cylinder, horizontally opposed engine used in ck has been designed by members of the Society of otive Engineers. It develops about ten brake horse- and is capable of propelling the truck at the rate of s per hour when carrying 3,000 pounds, about twice ed of a horse at trot. Its maximum speed, unloaded, iles an hour. The truck alone weighs 1,800 pounds. ause the car is designed for frequent stop, short-haul ies, the motor is seldom shut off. It is, however, d with a self-starter. In the water cooling system, a is employed, operating on the same principle of nu- small stationary engines, which eliminates radiators, d pumps, and the usual freezing hazard.

The truck, with body completely equipped, sells for $950 f. o. b. Chicago. The designers not only have applied the principles of efficient automobile construction to their product through fourteen years of experimentation, but they have utilized ideas that have proved of value in the construction of motorcycles, aviation engines, and stationary gas engines. The truck embodies features so different from conventional designs that it may justly be regarded a new type of motor construction, yet every detail conforms to established engineering principles.

TWO NATIONALLY KNOWN MILK BOTTLE COMPANIES CONSOLIDATE.

The Berney-Bond Glass Company, Clarion, Pa., and The Winslow Glass Company, Columbus, O., having in common the same high ideals of quality and service and ever mindful of their increasing responsibility to their many customers, have joined forces to the end that they may effect a wider field of usefulness.

It is claimed that the merger will give the customers a better bottle, because the combined knowledge of both engineering departments will be united; quicker delivery, due to increased manufacturing capacity and factories located in different sections; and uninterrupted service, due to the fact that there are now five complete manufacturing units, two at Clarion, Pa., two at Columbus, O., and one at Hazelhurst, Pa.

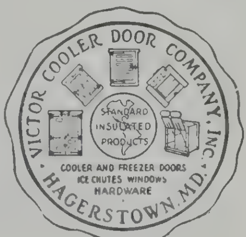
* * *

VICTOR COOLER DOOR COMPANY INCREASES PLANT CAPACITY.

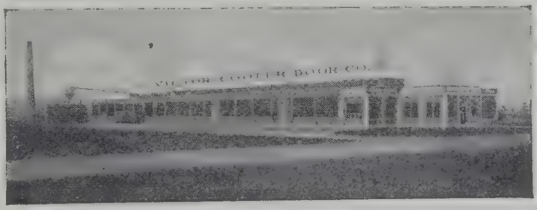
Back in 1917 several modest frame buildings, with a floor space of 4,200 square feet, represented the factory possibilities of the Victor Cooler Door Co. But, today, the former factory would not be sufficient to house the present shipping department.

In but ten short years the recognized standard of the Victor Cooler Door Co. products has made necessary the erection — at Hagerstown — of a magnificient steel and brick construction factory building, containing more than 42,000 square feet of floor space —all on the ground floor.

And even this greater structure is proving none too large to take care of the great increase in the demand for Victor Standard refrigeration products, cooler and freezer doors, ice chutes, windows and refrigeration hardware.



With every part of this new and modern plant flooded with direct daylight—with the most modern of efficient and labor-saving equipment— with the most comfortable and up-to-the-minute offices and executives quarters—and with shipping facilities second to none, the Victor Company is consistently keeping step with the unusual and rapidly growing demand for its product.



Victor Cooler Door Co.'s Plant at Hagerstown, Md.

The new trade mark seal of the company evidences this organization's appreciation of the value of a recognized and merited name of dependability, the confidence it inspires and the quality it assures.

* * *

TWO BIG FIRMS MERGE.

According to an announcement in the Toledo newspapers, M. V. Girkins, vice-president and general manager of The Automat Molding and Folding Company, disclosed the fact that negotiations have been concluded for the merger of The American Butter Cutting Machine Company of New York with the Toledo company.

The joining of these two companies, with manufacturing centered in the Toledo plant, is a big forward step in the history of The Automat Company, and makes it the manufacturer of the most complete line of wrapping, cartoning and cutting machines ever made by any one concern.

R. F. Stewart, former head of The American Butter Cutting Machine Company, is well known to the dairy trade and as an inventor and manufacturer of printing and cutting machines and other labor saving devices for print rooms, has obtained a wide distribution of Stewart equipment throughout the dairy industry.

Under the merger agreement with The Automat Company, Mr. Stewart will have charge of the New York sales office, and servicing the complete Stewart-Automat line.

With the establishment of the New York office under the personal supervision of Mr. Stewart, The Automat Molding and Folding Company now has sales and service branches in three strategic centers of the country through its New York, Toledo and Los Angeles sales offices. The complete Automat line now comprises the following units: wrapping and cartoning machines, wrapping machines, tub cutters, print-making machines, individual chip cutters, and collapsible butter boxes.

The engineering staff of The Automat Company has been augmented by the addition of Stewart engineers, and, according to Mr. Girkins, plans are already in force to design and produce a line of the most efficient machines ever offered to the trade.

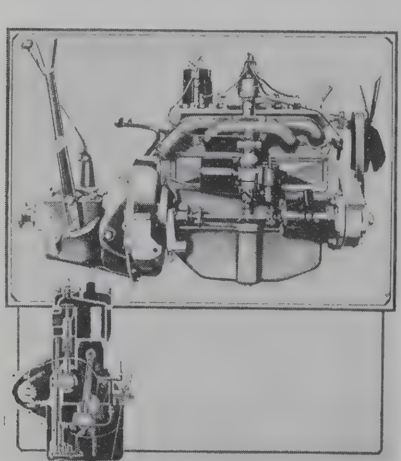
The Automat Company was incorporated in 1921, and its history has been one of continuous success. Automat machines of various types are operating throughout the country.

Officers are: J. J. Urschel, president; M. V. Girkins, vice-president and general manager; G. H. Faist, secretary, and Geo. C. Urschel, treasurer.

* * *

NEW ENGINE IN GRAHAM BROTHERS TRUCKS.

A great step forward in Graham Brothers history—and in motor truck development—has just been taken. A new, greater performing four-cylinder engine built by Dodge Brothers, Inc., now replaces the former powerful and economical engine which has been built into Graham Brothers truck for six years.



More power, greater speed throughout the range of usual operation, quicker pick-up and smoother, quieter operation at all speeds result from the use of this new motor.

However, the most striking fact about the new engine is that while it develops more power and has greater acceleration it actually operates on less gasoline.

The chief reasons for this are the improved vaporization of the gasoline due to the design of the new intake and exhaust manifolds with "hot-spot" and to the new combustion chamber with sloped head.

The fact that the new engine is now used in all Graham Brothers trucks and commercial cars, including ¾, 1, 1½ and 2-ton models—capacities which serve 91.9 per cent of all commercial motor transportation requirements—makes the advance important to practically every user and prospective user of delivery and hauling equipment.

The new engine is fitted with a sturdy, heavy-duty transmission and a large single plate clutch, both de
truck service.

While the engine is a new design, the bore
dimensions and the time-tried qualities of the one
—which is serving thousands of truck owners so
retained. The large chrome-vanadium steel crank
five main bearings and the highly efficient two-u
generator system, introduced during the last y
Dodge Brothers engines, are essential features.

The smoothness of power flow resulting from t
in the engine itself has been enhanced by increase
of the engine supports. This reduces vibration to a
and permits much smoother operation at all speeds
all driving conditions.

The distributor is mounted on top of the new e
eliminating the possibility of trouble from wate
which might enter through the radiator or the lou
sides of the hood.

The location of the water pump has been im
placing it at the rear of the engine. From the
water goes directly to the rear end of the cylin
which is the hottest part. From there, it flows forw
radiator where it is again cooled.

The long hand brake lever has been fitted w
ratchet and improved release and is exceptionally
for quick action by the driver.

Throughout the engine, improvements have b
toward the ideal of the best possible performance a
est operating cost.

* * *

NEW EXPERIMENTAL EQUIPMENT.

New methods of producing milk products a
worked out in the laboratory before they are put
tice in the milk plant. One of the signs of the ti
increasing use of laboratory equipment, both in m
and in the agricultural colleges. An interesting a
experimental equipment has recently been devel
placed on the market by Arthur Harris & Co. of C
is a small, compact milk evaporator, embodying a
provements this company has made during the last
large size evaporators. Instead of the usual coils
jacketed bottom, there is a set of three individual f
ring coils.

The body is made in two sections and hinged a
ter so that by uncoupling the vacuum suction line a
ing the clamps, the top half of the evaporator can
back, leaving the inside exposed for easy cleaning.
paratus is furnished complete with vacuum pum
necessary valves and fittings ready to be connect
water and steam lines.

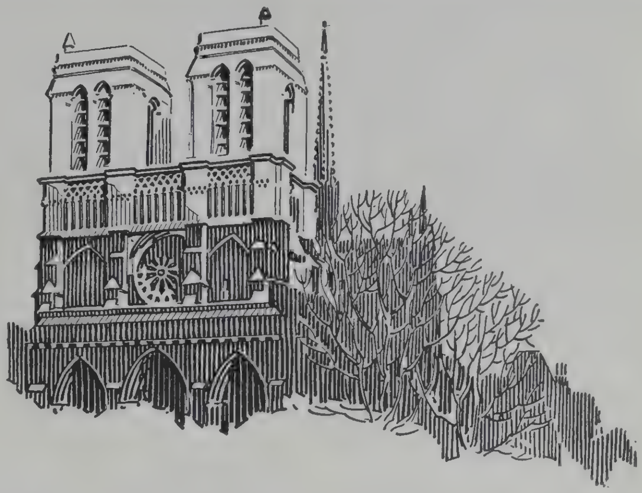
S OF DAIRY PRODUCTS TO HOLD STRONG FOR SOME TIME.

). Pope, farm economist of the Alabama Experi-
Station, Auburn, Ala., has made an analysis of
t supplies and prospective production of livestock
estock products which reveals that prices of dairy
ts promise to hold strong for some time. The
nption of dairy products is increasing and this
se is increasing the demand which is being re-
in prices. It is expected that dairy products will
a good price for some time.
e analysis shows that important livestock changes
seen during the next few years.



See.. Europe

while attending the

World's Dairy Congress

THE World's Dairy Congress, the greatest international convention of dairy products manufacturers in the history of dairying, will be held in London, England, June 25th until July 4th.

As official transportation agents for the American Delegation, the American Express Company offers a number of carefully planned tours before and after the convention.

These tours vary in length from the ten day tour between the arrival at Cherbourg and the official opening of the Congress in London, to longer and more comprehensive tours to various countries following the Congress.

Planned by travel experts, the itineraries of these tours cover both the important places of interest, and those away from the beaten path. The difficulties of strange customs, currencies and languages are smoothed over. Each travel party will be accompanied by a travel expert.

The American Express Company employs more than 2,000 people in its foreign offices, and its travel service forms a network over Europe. It is estimated that 90% of all American travelers make some use of its offices when abroad. Since 1891, the year it devised the Travelers Check System, the American Express Company has been perfecting its service to American Travelers in Europe.

It is not too early to make plans for this great Congress in London, and the subsequent tours. *For further information write to*

Wanted—A National Slogan

For Selling and Advertising Milk. What the Connecticut Milk Producers' Association is Doing to Attract Public Attention

[By Special Field Representative of the Olsen Publishing Co.]

IS THERE a best slogan for selling milk? If so what is it? Have you the "best" one tucked away some place in your advertising that you feel will do for all the rest? Several have been proposed and none taken because there so far has been no national advertising of milk by any organization of any moment today backed by any adequate allotment of funds to make a dent in getting over to all or to any considerable portion of the populace WHAT MILK WILL DO other than that done by the health agencies, nurses, teachers in the great health movement that has swept over the country the last few years. This latter group without question has been the dominant factor in the impetus given to the extension of the uses of milk especially. Every one who has done any advertising has doubtless helped some but the consumer does not take readily pure educational material when placed in apparent advertising space allocated and paid for by an advertiser who has something to sell as his immediate motive.

C. E. HOUGH.

Well, what is the national slogan? This article will deal with one of the following picked up on a field trip to good old New England. We have had proposed several slogans. Which do you like best and why? The editor of the National Milk Slogans Suggestions will welcome your criticism and suggestions now. "Milk for Health," "A Bottle of Milk is a Bottle of Health," "Be Healthy—Drink Milk," "Milk—A Quart a Day for Every Child—A Pint for Grown-ups," "Milk—the Food for Thought," "Milk, the Best Food We Have,"
—Good to the Last Drop," "Milk, There's H
Every Drop."

"All good in different ways," you'll say, b
is being done about it? You might say, "Let'
thinking about it and then it may be we can get
something together about it, or raise some fu
then decide on the program." The writer beli
should first take some definite surveys to find o
if national milk advertising is feasible and t
way to go about it after the facts are secure
takes time and should be started before any broa
of national advertising should be attempted.
tising and sales surveys, when properly condu
trained surveyors, has shown to milk and ic
dealers oftentimes a saving of from 30 to 50 per
their funds, generally expended with equal o
results. It is known that this has had the atte
the advertising and sales section of the Inter
Association of Milk Dealers and doubtless so
definite will appear in due time.

Connecticut Takes the Lead.

It was six years ago that C. E. Hough took
of the Connecticut Milk Producers' Association
the building housing their office he had erected
signs, "Drink Milk" and the other one "Be He
Later when the Connecticut Dairy and Food
was organized in 1922 the two slogans, which fa

ing for a better position? Why not try a "Milk
Want Ad. They bring results.

"LIKE FATHER, LIKE SON."

J. E. Bell, state dairy expert, recently told dairymen of the lower Rio Grande Valley that they must act like gentlemen if they would have their cows produce good milk, and lots of it.

"Never excite a cow by loud talking or by hard driving, abuse or any unnecessary disturbance," advised Bell, who also suggested that balky bovines can be made to milk more freely if the milker wears a freshly laundered white uniform.

LUCKY LINDY LODGE

Miss Nave, "The Viking Cinderella," christens the "Lucky Lindy Lodge" with a bottle of milk. A tract of beautiful mountain and forest land comprising 240 acres of the Fayson Estates on Fayson Lake near Boonton, N. J., was formally dedicated and named for Col. Charles A. Lindbergh under the title of "Lucky Lindy Lodge." In this secluded and idyllic spot a four-room hunting lodge of field stone and waxed chestnut log construction was built for "Lindy" to rest up when he got through with the New York reporters. A deed for the lodge property, including the run of the entire reservation, which is hemmed in by the Boonton and East Jersey watersheds, was presented to Col. Lindbergh upon his arrival there by the owner, Frank B. Fay.

Milk for the Flood Refugees

Nature's Perfect Food Plays an Important Part in Providing Nourishment for Suffering Thousands. "Milk Time" on the Levees

By FELIX J. KOCH

IF THERE has been one time, more than any other, when milk has done its bit by the great human race that has bred and fostered the cows producing it, 'till they have reached their present super-grades of butterfat efficiency, it was at the very height of the rescue-work for the vast Mississippi river flood zones.

Almost so soon as the waters of the Mississippi and then its major tributaries had risen to either crevasse and break the protective levees of a stated area, or had poured over levee tops to flood the bayou land behind, local agencies, and then the parent Red Cross, set to work bringing out the refugees.

Nature of the territory made the plan of operation a rather step-on-step one. Usually, some large steamer, volunteered to this end, was sent to some central base point in the river.

Around the Milk Tents of the Camps at Vicksburg.

Out and away from that what motor boats and motor launches could be secured would hurtle, going to so far as could be to the submerged buildings, the rises on which people had taken refuge with the caving of the banks. Unable to make a passage closer in then, and the water too deep for the wading over to the parties to be saved, skiffs and punts, with outboard motors, were employed to get them from the shore.

Brought to the big boat, this moved on—up river—to collect more and more of the refugees so, until holding all that decks might hold. Then—full speed—off and away to what rescue camp was nearest, and still might offer accommodations for these.

At these rescue camps there were regular meal-times always, when all who would might stand in line; file past long tables, where volunteer chefs, refugees themselves, all attended carving, serving, and receive all the food that they desired.

But, bringing an entire country-side, it usually was, to a refugee-encampment, meant bringing endless hosts of children, of wee babes, just past the nursing stage, and, in turn, of nursing mothers, along.

Things are dire enough with the poor refugees. God knows; almost all of them state, very frankly, they have had their very all swept away. This so, their health, their kiddies, health and strength, must be conserved, over all.

Milk is the one item of fare found, by lon
ment of welfare-workers put to like situations
every need of a situation like this here.

The more milk, within reason, a babe, a chi
grown adult even, will take per day, the bette
all-'round, in the end.

At the refugee camps about Vicksburg, the
was arranged, very early, that all in addition
milk might be served with the meal-times, the
be distinct milk-calls as well between.

Nicely convenient to the very largest pa
huge encampment, in each case, there was pit
tent just for this work and that labelled, ther
TENT, that all might see.

Each newly-arrived quota of refugees come
and brought up for the inoculations against c
diseases that were required there, was given di
structions as to this.

Neat, bright, shiny tin-cups were issued eve
Your cup was yours to the end. You might
other and another if you lost it. Please, thoug
good of all, do not lend your cups around!

With this cup you might come to the milk-t
times—at the mid-meal periods—and have all
you desired. Drink your fill and welcome; onl
don't be wasteful. Even a tablespoonful of mil
by each random comer here must mean gallons
waste in the end.

Issuing the cups, inexpensive tin-plates we
also. If one wished, he might bring the plate
the tent there and receive a generous helping
clean, healthful crackers along.

Nor did one have to come in person to the
for one's supply.

Mutual sorrow breeds mutual helpfulness all
everywhere about the camps one found a spirit
ally WANTING to lend the next-neighbor a
hand.

So when Ora or Earl went down to the
with the cups for themselves and mother a
brother and tiny sister, they stopped always
those of the poor, despondent widow with the
the tent across the way.

And when Mrs. Brown or Mr. Black went to
Tent with the cups for their own families, the
take those of some broken, dejected, spiritless
refugee on the tent-street along.

Everywhere thus the custom for milk-time.

Everywhere a seeing to it that all who mi
for such should be abundantly supplied.

At the tent, procedure was extra-simple:

The endless line filed slowly by. It came to
door, blocked by a kitchen-table. Behind the g
of milk awaited. As they emptied, they were
by others from the truck behind.

One attache filled the cup and placed it on
plate, or returned it to the owner. The next ad
helping of crackers for the caller only; or
served as well in turn.

Off and away, then, to wherever one's ten
make place for other comers, filing past then
space through—more and more, and ever more

FROM OWNER OF ONE-HORSE DAIRY TO HEAD OF ONE OF LARGEST INDEPENDENTLY-OWNED DAIRIES IN COUNTRY IS RECORD OF ROY BABCOCK.

About thirteen years ago a young man with one horse and a milk cart delivered the best grade of milk he could obtain to a route which brought him in contact with the best families in what was then known as the West End of Toledo, O. Roy Babcock was the name of the young man. It wasn't long until Roy's service and merchandise had made such a name for itself that he was forced to expand his business to the extent of operating a plant with several routes, serving an increasing number of patrons.

Mr. Babcock now has a fine, modernly equipped dairy plant which he operates at Berdan and Martha Avenues, Toledo. It serves 12,000 customers on 30 great milk routes with the fresh milk which 18 huge trucks have collected from the farms in the vicinity of Toledo. Cottage cheese and butter also are products of this dairy. Baby Special milk is also one of the features.

The Babcock plant operates its own ice factory, producing sufficient for refrigeration of all wagons and trucks, totalling some three tons or more daily. A refrigeration system in the plant also is operated. The plant, in its entirety, is said by Mr. Babcock to be one of the largest independently-owned dairies in the country.

Associated with Roy Babcock, who is president and general manager of the Babcock Dairy Co., are his brother, Walter H. Babcock, vice-president and assistant manager, and E. E. Urie, secretary and treasurer.

Mr. Babcock also has been active in civic enterprises.

⁂

FREEMAN DAIRY COMPANY HAS NEW MANAGER.

John. J. McDonald of Detroit has been named vice-president and general manager of the Freeman Dairy Company of Flint, Mich., it was announced in connection with notice of the retirement from the active management of the company of Leonard Freeman. While Mr. Freeman is retiring as the acting head of the concern, he still will remain president of the company. Mr. McDonald also becomes a stockholder.

Until he resigned to come to Flint, the new general manager of the company had been general manager of the Arctic Dairy Products Co. of Detroit since 1923 when that company took over the Conner Ice Cream Co. of Owosso in a merger. It was Mr. McDonald who developed the Connor company which started as a small concern 20 years ago.

Mr. Freeman has been the active head of the Freeman
Dairy Company since its organization in 1913.

PROTECTION

Unretouched Photograph of the United States Battle Fleet steaming through the breakwaters into the harbor at Los Angeles, California.
(Photo by Underwood & Underwood)

ttleship Construction of the *CP* Ladewig Washer Is Your Protection Against Shutdowns

ike a mighty battleship, the *CP* Ladewig sher is fully armored and ready to do le — to dirty bottles. Boiler plate and y rivets make up its walls and compart ts and give it the weight and strength ithstand the strains and stresses to which ay be subjected.

ike a battleship, the *CP* Ladewig has its guns, but in the form of hydraulic scrub jets. Every bottle receives six individ jettings, completely annihilating the my—dirt, old milk and bacteria.

ike a battleship, the *CP* Ladewig is de dable. By building every part over size extra strong, we know with certainty it will give maximum protection, service profit to the plant that owns one.

Attention - Mr. W. D. [illegible]

Gentlemen:

We have been using our Ladewig Bottle Washer nearly three months and find it far superior to the pressure washer.

During this time we have not received any complaints due to dirty bottles. Previous to the time we began operating the Ladewig machine, scarcely a day passed without at least one complaint due to dirty bottles.

We also find the breakage of bottles to be very small, as compared to the breakage experienced with the pressure washer.

Yours very truly,
HOSLER'S DAIRY

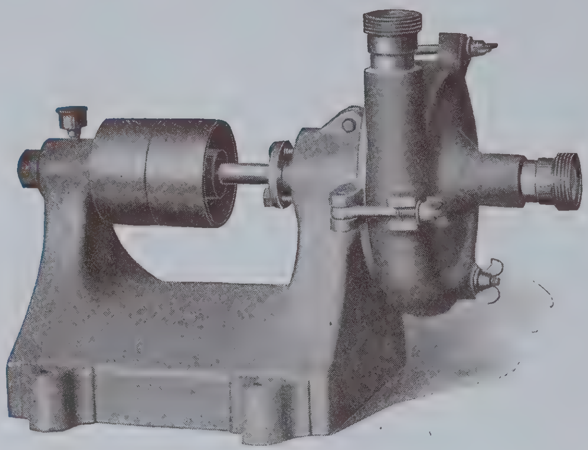
"FOR BETTER MILK HANDLING"

The YORK Milk Pump is made in No. 1, No. 2 and No. 3 sizes and in either belt drive or direct motor drive.



Belt driven pump assembled.

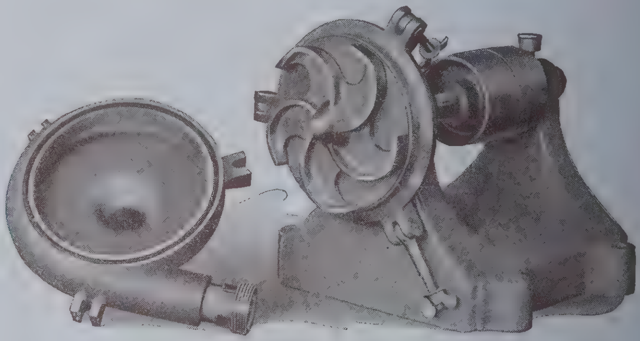
YORK No. 2 Milk Pump

A PUMP which can be cleaned easily and thoroughly is a boon to the dairy. That is what you will find in the YORK No. 2 Milk Pump.

By loosening three thumb nuts, you are able to clean every inch without any guess work. There are no cracks or crevices which are hard to get at.

It has an oilless bearing at the impeller end, and a shaft made of 70% nickel. All castings are brass heavily tinned with pure blocktin. Regularly furnished for 1½ inch sanitary tubing connection. May be had direct connected to motor or belt driven.

The illustration shows the belt driven pump.



Belt driven pump taken apart. Note easy access for cleaning.

of

CLEANLINESS

in Milk Plants and Creameries

THIS necessity for absolute cleanliness is an important item in costs in the milk business. Here's a suggestion:

By using Solvay Super Cleanser, the IDEAL cleaner and cleanser, you make sure that your equipment is kept perfectly clean at all times at the minimum of expense.

You actually save money by using Super Cleanser because it is produced and sold direct to the trade by the largest producer of alkali products in the United States. You get the benefit of large scale operation together with prompt handling of your order through the nearest of our many distributing points.

OUR Technical Service Department will gladly discuss with you your particular cleaning problems — entirely without charge — or we will send you a booklet on Solvay Super Cleanser with generous testing samples. Ask for Booklet No. SC2.

This Dairy Saves

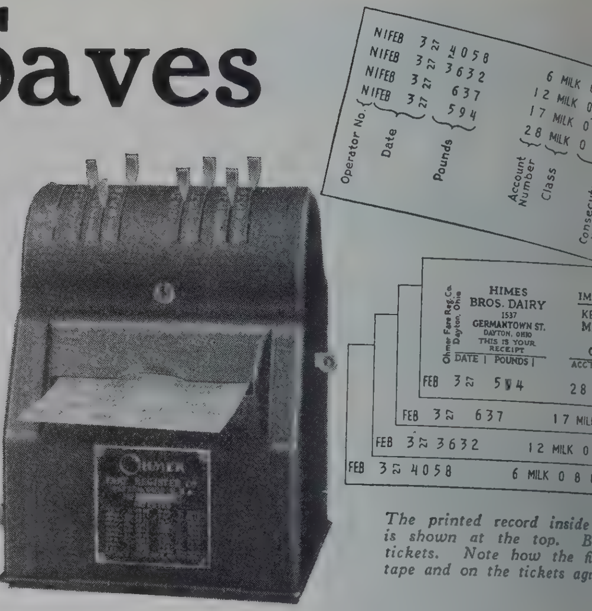
$1,550 per year

with an

OHMER

REG. U.S. PAT. OFF.

Ticket-Printing Register



The printed record inside is shown at the top. B tickets. Note how the fi tape and on the tickets ag

"IT HAS saved us anywhere from $3.50 to $5.00 per day. On a basis of an average saving of $4.25 per day over 365 days, an annual saving of more than $1,550 has been made possible." That's the experience of the Himes Bros. Dairy, Dayton, Ohio, with an Ohmer No. 79 Ticket-Printing Register. And any dairy or creamery that adopts this register can realize similar savings.

Quick and Accurate Receiving Records

When your receiving department weighs the milk or cream delivered by a producer, the clerk sets the levers of the Ohmer Register, turns the crank, and two things happen—**a ticket or receipt is issued and a duplicate record is made.** The ticket shows the name of your company, the date, the weight, the account number, the kind of product, and the consecutive number of the transaction. The ticket is **printed complete** from type in the register, automatically set by the simple manipulation of the levers.

At the same time—**from the same type**—a **duplicate record** of the data is **printed on a tape locked in the register** and accessible only to the official who holds the key.

There can't be any errors or misunderstandings from illegible, blurred, or transposed figures. There can't be any lost or mutilated memoranda. There can't be any erasures or alterations.

Simplified Accounting

When the milk or cream is all received, the record inside the register contains all the detailed information for easy bookkeeping. The printed record made by the register in tabulated form comprises a complete and permanent journal. Ledger accounts can be posted directly from it. And your bound to tally with the prod ceipts.

Errors and confusion are avo this simple, perfect system o ing. Receipts are issued and are made in much less time t be done by hand-writing—and infinitely more readable. The transaction can't be lost or o Disputes are eliminated and are satisfied—they are glad to readable receipts for conve keeping their own accounts.

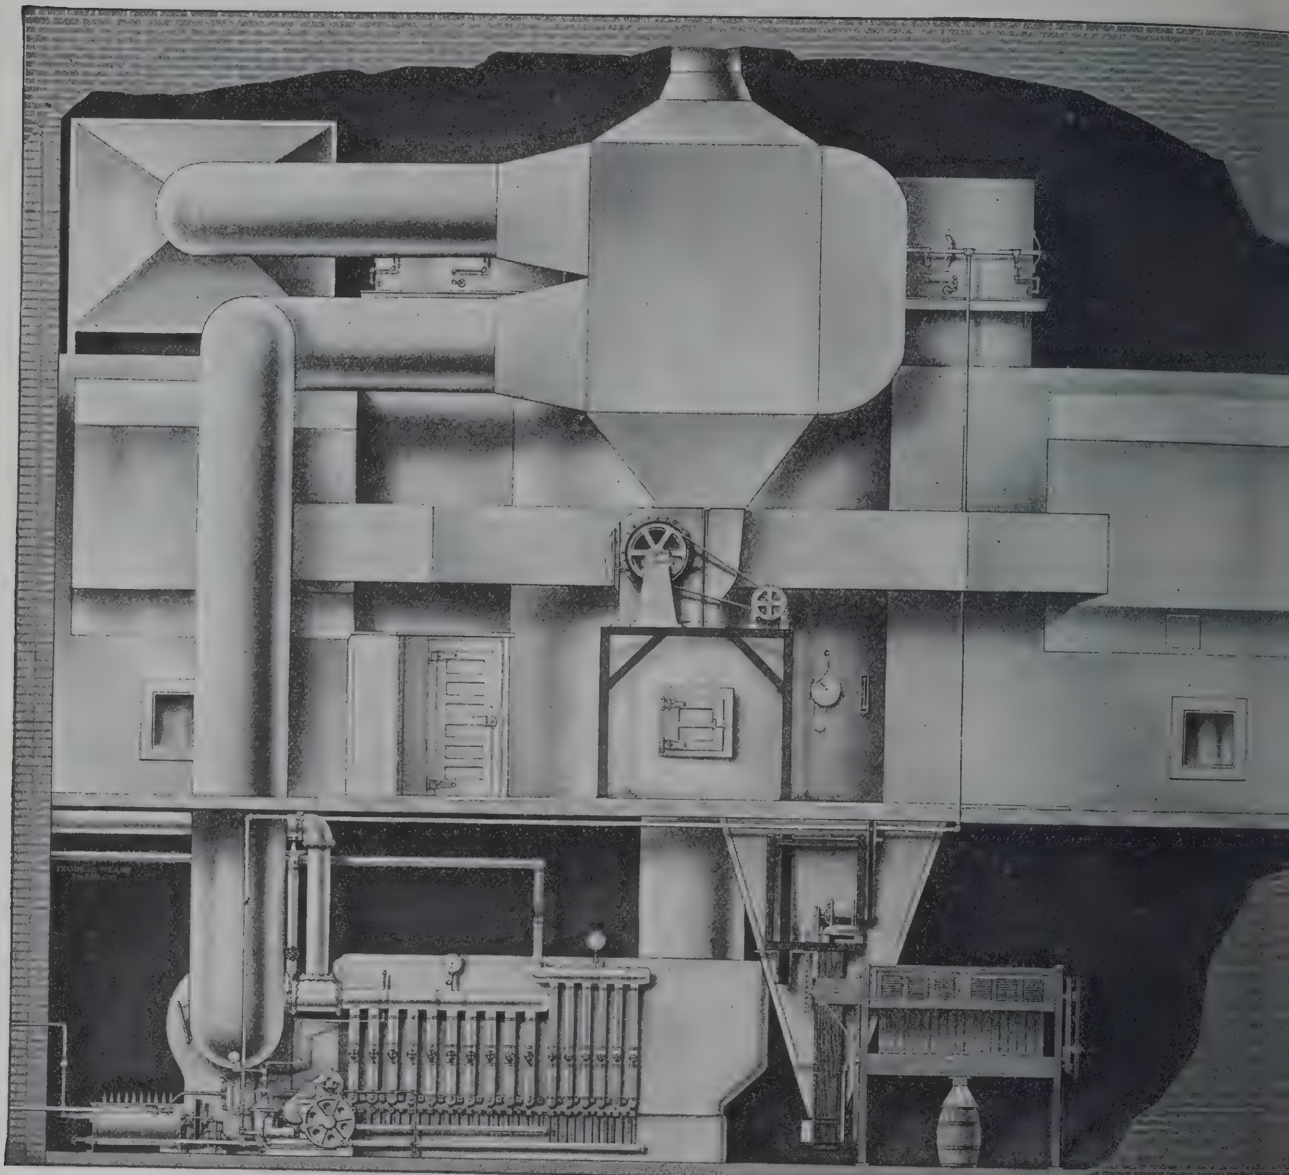
ROGER

SPRAY PROCESS



MILK POWDER PLANT

Costs no more than other spray process milk powder plants — yet it produces approximately t times the quantity of milk powder, of higher quality, and at considerably less Steam, Power Labor cost per pound of powder produced.

Produces milk powder that is more readily and completely soluble even in ice cold water.

Gives complete recovery of solids.

Produces a uniformly high grade powder of lower bacteria content, and of any texture desired.

Guarantees a uniform moisture content under 2%.

Eliminates all possibility of second grade powd

Gives you a license to operate under Rogers pa without any strings tied to it.

Does not require you to pay royalties. This sa alone, not counting lower manufacturing costs, pay for a Rogers Plant within two or three years

Once you see a Rogers Spray Process Milk Powder Plant in operation you too will be convinced of its superiority an ceptional money making possibilities.

Let us show you one of the 20 Rogers Spray Process Milk Powder Plants in operation, and give you complete and rel information on MILK POWDER — its Manufacture, Uses and Marketing.

"JUST THE THING"

An educational exhibit showing the food value of milk, butter or ice cream—

FOR HEALTH FOOD SHOWS, CONVENTIONS, FAIRS, WINDOW DISPLAYS, ETC.

Attractive-Educational-Effective

Artists in the Educational Display Department of the National Dairy Council have just added the "finishing touches" to another unique exhibit, emphasizing the value of dairy products. Whenever doctors, dentists, school authorities, health commissioners, or other influential groups meet, the Council's outstanding message is there to inform them of the latest scientific and practical information.

Many of these effective displays are available for rental to the dairy industry, on a cost basis, for conventions, food shows, window exhibits, schools, fairs, etc. As this new department develops, more of these unusual displays will be announced. This is another striking service of *your* educational organization.

AMERICAN COPPER & BRASS WORKS
ACBW
CINCINNATI, OHIO U.S.A.
Adopts Pure Solid Nickel for "Americo" Pasteurizers

"Americo" Pasteurizer, Ripener, Mixing Vat, Holder and Buttermilk Machine with Pure Nickel lining for vat, Nickel coils and Nickel lids. Manufactured by AMERICAN COPPER & BRASS WORKS of Cincinnati, Ohio.

TO INSURE LASTING CLEANLINESS AND A QUALITY PRODUCT, LEADING MANUFACTURERS USE NICKEL

THE responsibility of equipment manufacturers to their customers, and the equal responsibility of dairies to the general public, dictate the use of the most sanitary construction material.

With this fact in mind, leading manufacturers of dairy equipment now use Pure Solid Nickel in order to insure low bacteria counts for the dairy products handled in their equipment.

This general acceptance and use of Pure Nickel by the leading companies in the industry result from the ever-increasing appreciation of the properties of this attractive silvery metal:

1. It does not contaminate dairy products.
2. It resists the corrosive attacks of dairy products.
3. It will not rust.
4. It has no coating to wear off.
5. It is strong and tough as steel.
6. It is easy to clean and keep clean.

Every one of these properties is important to buyers of dairy equipment. Therefore, we suggest that in ordering your new equipment, you specify Pure Solid Inco Nickel.

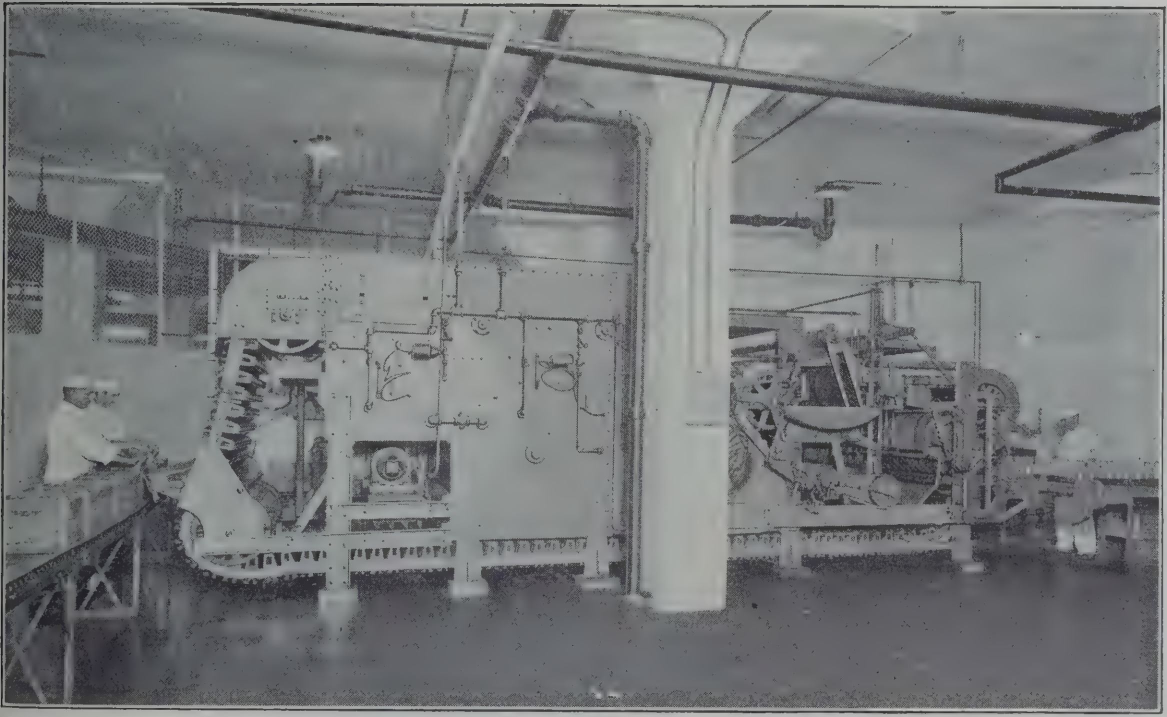
MORE PROOF!

of the SUPERIORITY of the

CLEVELAND BOTTLE WASHER

MR. OLDHAM of the Phenix Dairy, Houston, Texas, after having carefully studied all makes of bottle washers for more than three years, decided on the **CLEVELAND** for his new plant, which is one of the largest and most up-to-date in the South.

He was thoroughly convinced that the **Cleveland Method of Pressure and Dormant Soaking in Conjunction with Clean and Sterile Brushes** would give him the cleanest and most sterile bottles to match his unexcelled product. Furthermore he knew that the Cleveland Bottle Washer was the machine for service due to its rugged construction and simplified design and this has been conclusively proven by the fact that **The Phenix Dairy erected and put their bottle washer into operation themselves without the assistance of any representative of the Union Engineering Co.**



No. 120—CLEVELAND BEST-OV-AL in The Phenix Dairy, Houston, Texas

Guaranteed Cleaning Efficiency 99 9/10%

DOUTHITT ENGINEERING COMPANY

100 WEST MONROE STREET, CHICAGO

Sheffield Farms Company's plant at Lisbon, N. Y.

Add to your creamery profits by manufacturing your skim milk, buttermilk, or whey into powder on the Gray-Jensen Spray Process Milk Powder Plant.

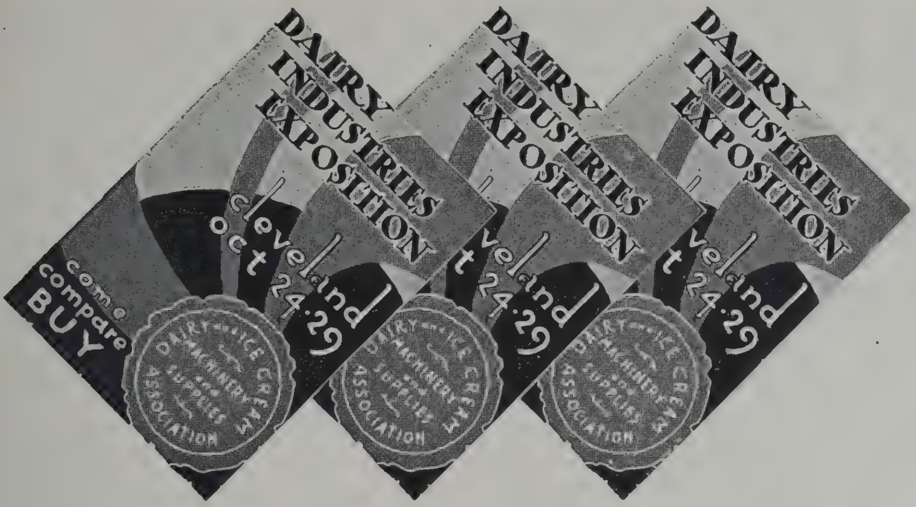
The highly developed efficiency of the Gray-Jensen process results in recovery of milk powder actually equivalent to the solids in the milk, with lower labor, fuel and power costs than are possible with any other type of milk powder plant. These savings alone pay for one of our plants in from one to three years. Operating records prove this.

We can furnish an assured market for all skim milk and buttermilk powder made on our plants.

These plants are built in sizes to handle from 10,000 to 120,000 pounds of normal liquid milk or milk products daily.

Write today for booklet describing the Gray-Jensen Spray Process Milk Powder Plant

When writing to DOUTHITT ENGINEERING COMPANY *please mention The Milk Dealer.*



DAIRY INDUSTRIES EXPOSITION

OFFICIAL ORGAN OF
The International Association of Milk Dealers
Dairy Products Association of Kentucky, Inc.

JULY, 1927

BULLETIN *of* EVENTS

Dairy Industries Exposition—The second annual exposition of the Dairy and Ice Cream Machinery and Supplies Association will be held at Cleveland, Ohio, on October 24-29, inclusive. Roberts Everett, 225 West 34th St., New York City, secretary and manager.

International Association of Milk Dealers—Twentieth annual convention to be held in Columbus, O., on October 19, 20, 21 and 22, 1927. The Neil House will be convention headquarters. Secretary, R. E. Little, 228 No. La Salle St., Chicago.

Pacific Slope Dairy Show—Seventh annual exposition to be held from November 14 to 19, 1927, at Oakland, Calif. Secretary-manager, Robert E. Jones, 1404 Franklin St., Oakland, Calif.

Ohio Milk Distributors' Association—Annual convention to be held in connection with the convention of the Ohio Association of Ice Cream Manufacturers and the Ohio Association of Creamery Owners and Managers, at Toledo, on January 24 and 25, 1928. Commodore Perry Hotel will be convention headquarters. Secretary, W. A. Wentworth, 5 East Long St., Columbus.

EVERYTHING points to the greatest outpouring of milk men in the history of our industry at Columbus in October, at the annual convention of the International Association of Milk Dealers. For the first time in many years the convention will be held entirely free from other attractions. There will be no show or exhibit of any kind in connection. Four full days will be given over to a consideration of the problems in the industry.

Then the following week the big Dairy Industries Exposition will open in Cleveland. Delegates to the Columbus convention will go on to the big show in Cleveland with nothing to do but profit and play. Make your plans early to visit both cities.

IT DOESN'T require very much brain material
liver a bottle of milk. A flashlight and the
to read figures on a milk card make it possible to d
milk, even before daylight. If a man is content t
milk delivery man, and his employer is content
such ability, then lack of gray matter, sales abili
ambition, or whatever you may please to term it,
a serious handicap.

But if a man wants to be a milk salesman it
entirely different story. If he has ambition, kn
that promotion comes to milk salesmen and not t
delivery men, he must have real ability. He m
salesman enough to study the habits of his cust

their whims, and give them the sort of service
mpered public demands.
ong ago the milk card at our home was not
up for the morning's requirement. The usual
ts of milk were there just the same. Early in
oon the salesman called on the phone to inquire
the deal was satisfactory. If not, he would call
the milk. That's a little thing perhaps, but he
quarts of milk that otherwise he would not have
morning, and he pleased a customer. The real
sman finds many ways to build up business.

* * *

dealers are inclined to go along the even tenor
their ways, giving little attention to competi-
ept that offered by other milk dealers. They
or granted that there are no substitutes for the
they have to offer for sale.
realize, of course, that there are other articles
andise that the consumer might buy with the
e should spend for milk, but that sort of com-
doesn't frighten them. The man who orders a
offee for his noon-time lunch might order a bot-
lk instead, but even that sort of competition
bother the average milk man very much. He
on the theory that there is a certain fixed de-
milk, especially in the homes, that no one else
ly. He feels secure.
s he secure? What is happening in the homes?
are some of the things that are happening:
ple are eating in clubs, restaurants and hotels
before in our history. People are "going out
r" more each year. Less cooking is done in the
d this trend is not confined to any particular
society. Cooking oils, and other so-called sub-
or dairy products, are now extensively adver-
l extensively used, both in public and private
aces.
another significant thing has happened and
r all, is what prompts this editorial. Lying on
is a full page advertisement, torn from the July
of The Saturday Evening Post, in which evap-
ilk is presented to millions of readers as "the
ream and milk supply."
e reader who knows, the advertisement carries
ent that would justify him to tell his milk man
eliveries of fresh milk and cream, but it is filled
er suggestions to tempt the uninformed reader
m his or her milk man. "Undiluted evaporated
es in place of cream—at less than half the cost
" and "it can be diluted to suit any milk need,
s less than ordinary milk" are samples of the
ade for the product.
e you brought your milk supply up to date?"
xceeded in subtlety by "you need to **know** that
you use is pure, and fresh, and sweet, and ab-
clean." The implication is, of course, that the
can not be sure that his supply of fresh milk is
d fresh and sweet and absolutely clean." No
ys being out of date. Patronizing the milk man
ed as passe.

Now, we have no quarrel with the manufacturers of evaporated milk. It is a dairy product entirely suited for the uses to which it is ordinarily put. We strenuously object, however, to its being put forward as superior to fresh milk and cream.

But this is a free country, in spite of the claims by folks who sometimes in some places find it hard to get an adequate supply of "hard likker;" the evaporated milk folks can go right on educating consumers of fresh milk and cream away from them if they choose to do so.

What are the milk dealers going to do about it? Will they continue to rest snugly in the belief that they have little or no outside competition, or will they take steps to tell the consumers the truth about evaporated milk and their own products?

We believe that we have herein pointed out a real danger to the market milk industry, and that something should be done about it by our dairy leaders. What say you?

* * *

HOW to get the loyal co-operation of employees is an ever-present problem in the milk industry. In spite of all the labor-saving machinery with which the modern milk plant is equipped, the milk business demands lots of labor. The personnel of an organization can make or break the business. The plant manager who can get efficiency, plus loyalty, is worth his weight in gold and then some. Too many employees stop with efficiency and many never get that far. Even the efficient ones do what is put before them to do. They are quite as ready to quit at quitting time as they are to begin in the morning. They work by the clock and they have little or no interest in the business. They do not seem to realize that the business must succeed if their jobs are to continue.

Some milk dealers have adopted the plan of setting aside a bunch of stock and selling it to their employees. Each employee is permitted to subscribe for stock to a certain limit, payment to be arranged for weekly or monthly. Some have been delighted with the results; others have not. This plan has been followed out by employers of labor in other lines and in many cases it has proven very successful. Your business may not be arranged so that you can adopt it, but if it is so arranged it might be worth trying out.

* * *

THAT a thing worth doing at all is worth doing well was never better exemplified than in the experiences of several milk dealers we know in producing and marketing cottage cheese. Some have failed to gain the results they expected while others have succeeded, some to a degree far and beyond what they expected.

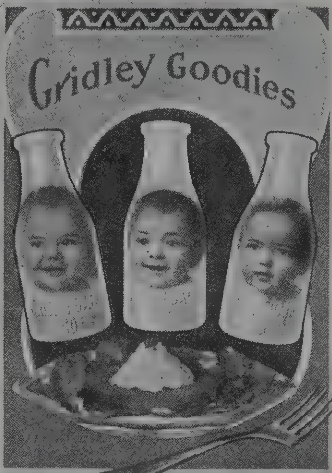
Most who failed didn't take the job seriously. They either failed to make a good product or they failed to market it right, or both. They treated it as a by-product of inferior value and their customers accepted it as such.

The dealers who have made good cottage cheese and marketed it in an intelligent, aggressive way have, in most cases, made money and strengthened the good will of their customers.

The Child as an Advertising Sub

By P. W. KOEPPEN

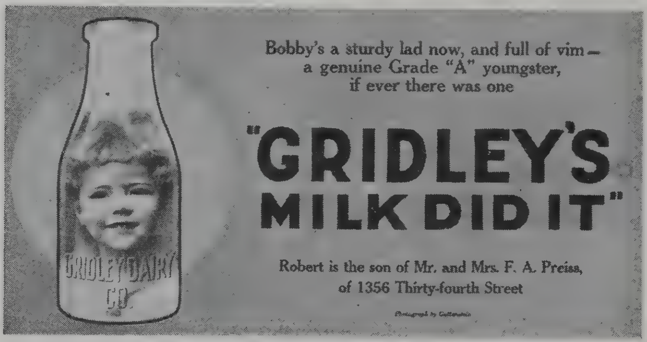
Milwaukee's Largest Milk Distributing C pany Builds Good Will by Featuring Childh in a Year 'Round Advertising Campa



FOR five years the Gridley Dairy Company of Milwaukee, Wisconsin, has been running the same kind of advertisement in the street cars, in the daily newspapers, and on the billboards, and the advertisements are arousing as much interest today as they did five years ago when they first appeared. On the street cars, you overhear people reading them aloud.

The ads have the same theme, have identical layouts, have copy very much along the same line and vary only in the colors used for the backgrounds. Yet everyone reads the ads and looks for new ones to appear. They have become news.

Harry H. Heming, who for 15 years has been handling the advertising of the Gridley Dairy Company, hit upon the idea of using children as testimonials in the Gridley advertising. They were to be attractive, healthy children who had been fed consistently on Gridley's milk. Their health and attractiveness were to be tied up with the milk in such a way as to form a dignified, convincing testimonial advertisement.



Bobby's a sturdy lad now, and full of vim—
a genuine Grade "A" youngster,
if ever there was one
"GRIDLEY'S MILK DID IT"
Robert is the son of Mr. and Mrs. F. A. Preiss,
of 1356 Thirty-fourth Street
GRIDLEY DAIRY CO.

Street Car Cards Used Freely and Continuously.

The layout, which is shown here, is invariably the same,—the baby, the bottle and the slogan—"Gridley's Milk Did It!"—together with the usual testimonial copy which runs much in the same vein and expresses the health idea in a few, simple words which are easily understood—for instance, "Gilbert is a husky little fellow who has been fed Gridley's milk since he was born," followed with "Gilbert's parents are Mr. and Mrs. Edward Smith, 666 Eighth Street, Milwaukee."

"There is nothing which has the universal appeal that children have," said Mr. Heming in a discussion of the Gridley advertising policies. "Everyone is attracted by a healthy child. We believe Gridley's milk t
ideal food for children and we want them to dri
of it. To accomplish that we educate parents to t
of our milk by showing them what Gridley's n
accomplished in the cases of other children.

"Five years ago we began the series of adverti
which is still running, and which we will continu
indefinitely. I believe that when you have hit
good idea, and have proved its worth, that the
do is to keep hammering at it. The public quic
gets unless it is constantly reminded. That is
advertise constantly and consistently.

"Our own deliverymen helped us to get sta
this series of advertisements. They were meet
patrons constantly. They knew families on thei
which had attractive children and turned thei
over to us. We got in touch with the mother and
her permission to use the picture of her child i

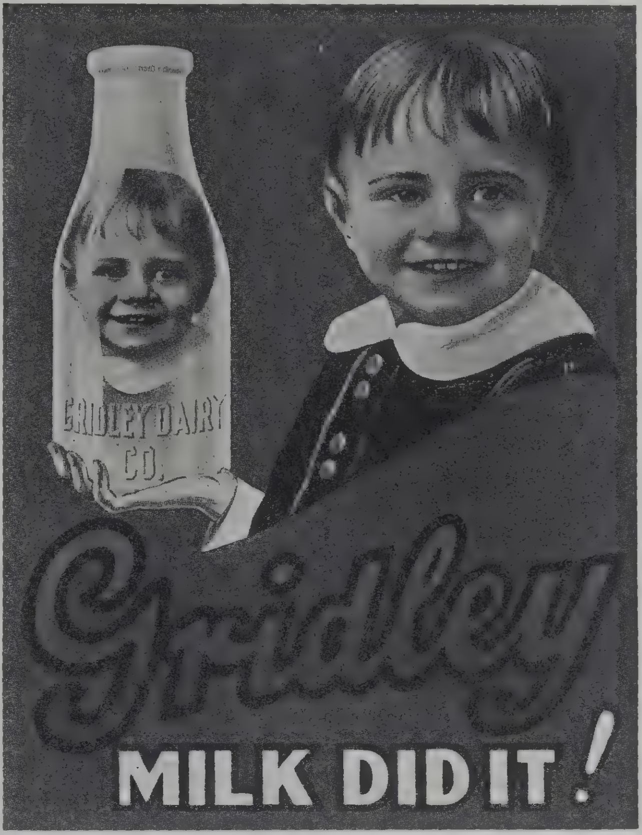
uple of years ago," said Mr. Heming, "we ran g contest to stimulate the use of our cottage We offered 33 cash prizes. The first prize was contest was announced in advertisements in the wspapers. We rented space in the Plankinton ne of the most prominent office buildings, and cookery delivered there. Four local judges, s on home economics, chose the finest cake, at dish, etc.

e were 285 entries in the contest. In practical- them the cottage cheese was so cleverly dis- at one would never have guessed that cottage s the main ingredient in them, and even those hey do not like cottage cheese could have eaten h relish. We raffled off the cookery after each sampled and graded, collected $60 and donated y to the Red Cross.

ı we secured the recipes for the best 100 dishes porated them into a cook book. This was de- our patrons by our delivery men. The book opular that we have demands for it even yet. etters from 28 states and two foreign countries r copies.

ve sometimes heard it said by men who do not believe in advertising, that if they advertise, their competitors will be getting the benefit of the increased interest in their community. They use this as an argument against advertising. This is wrong—absolutely wrong.

"It is true that advertising of any commodity will also benefit the non-advertiser in the sense that it will stimulate the demand for that product. But the advertiser is content if his advertising is successful and he gets his share of the increased business.



GRIDLEY DAIRY CO.
Gridley
MILK DID IT!

These 21x26 Advertisements Appear on All Principal Roads Leading Into the City.

"The Gridley Dairy Company doesn't worry about the milk business which may go to the other fellow because Gridley advertising is educating the public to drink more milk. As long as the business is increasing at a satisfactory rate, we feel that our advertising is paying.

"We have found that our series of advertisements, featuring the baby and the bottle, are effective and we intend to keep on along that line."

⁂

IT PAYS TO USE THE BEST EQUIPMENT AND METHODS OF PRODUCTION.

Plans have been made for increasing the capacity of the plant of the Sanitary Dairy, Filmore, Cal., according to Mr. Hardison, one of the owners. The dairy has had a steady increase in its milk business during the ten years of its existence, and Mr. Hardison attributes this to the sanitary methods of production which are used in the business.

A. R. Millsaps, the other owner, will continue to produce an unlimited supply of milk of guaranteed quality which is next to certified. The buildings and equipment belong to Mr. Hardison, who will cool, bottle and deliver the milk. A refrigerating plant is being installed which will cool the milk to the requirements of certified.

Milk Publicity in the Home To

A New Jersey Milk Company Gets a Three Page Story in the Official Organ of Their Local Chamber of Commerce

(Editor's Note:—We are privileged to publish below a story which appeared in "Trenton," the official organ of the Trenton, N. J., Chamber of Commerce. This is the sort of publicity that builds confidence. Are you employing such means for publicity in your city?)

IT WOULD be hard to imagine a more important industry—for indeed it is an industry—than that of collecting, protecting and distributing the milk supply of a city. Nature seems to have regarded milk as the essential food, the distribution of which in our modern city is a responsibility which increases with every new customer. The consumer is concerned mainly with the delivery. He wants it on his breakfast table. He is vaguely conscious that the health authorities and the dairy company have done their part to give him a pure food and that the dairy company has tried also to give him a product rich in those body building qualities which milk contains.

Fine modern plant of the Castanea Dairy Co., Trenton, N. J. Inserts—right, H. W. Comfort, president; left, B. M. Woodward, treasurer and gen. manager

Castanea DAIRY CO.

If the responsibility increases as the number of customers increase, then the Castanea Dairy Company, Trenton's chief agency in the distribution of milk, has a great load on its shoulders. A journey through the plant of the company impresses the visitor that the entire force realizes this fact.

Thirty years ago the milk business was a one-horse peddling of milk. Today it is a highly organized business, meeting in a most efficient way the increasing costs of producing pure, healthful milk by modern scientific methods.

From the well-designed two-story front the visitor does not gain the true impression of the size of the Castanea plant. Entering through the new retail store the visitor meets a guide who points out proudly that the beauty of this store, regarded among distributors as a model of its kind, is due largely to the mosaic tile that line the walls and cover the floor and counter.

In the office the visitor is given an idea of the size of the Castanea Dairy Company's field of operation. Its 60 delivery routes extend not only over Trenton and its suburbs, but over neighboring towns of Morrisville, Pennington, Ewingville, Mercerville, Hamilton Square as well, with an agency at Lambertville. In Princeton the Rockwood Dairy sells the Castanea milk.

To supply this territory, milk is brought principally
from the rich farming counties surrounding T
both in New Jersey and Pennsylvania. Twen
motor trucks are needed to gather the milk fr
proximately 500 farms and bring it to the city
This represents milk from between 5,000 and
cows. Every source of new milk supply is
investigated by the company's own farm and da
spector before the milk is taken on. He also ma
spections at different intervals during the year.

All the milk is bought by weight and butterfa

approximately 3.8 per cent butterfat. This doe
imply that all "A" and "B" milks are of this star
as this state and city do not recognize any standa
the grading of milk. They label all milk above
cent "whole milk."

On arriving at the receiving platform the fa
milk is inspected and weighed. A daily sample is
for the laboratory inspection. It is from a combi
of butterfat tests, bacteria tests, etc., and by the i
tion of a field representative of the company, tha
dairy received its classification. The milk then
through frost covered pipes, is thoroughly chille
held in large glass-lined tanks until ready to be
teurized and bottled.

About 1860 Louis Pasteur, the most noted ba

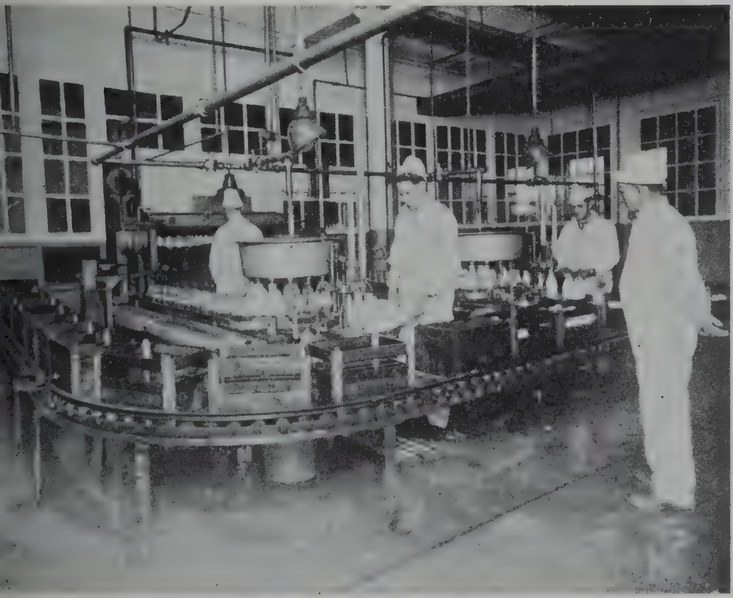
CASTANEA DAIRY

Neatness in Delivery Equipment is Highly Important.

in an effort to wipe out a deadly at was being germinated in beer, d by a process of heating in de- the harmful bacteria. This process me known as pasteurization and is lied to milk to destroy bacteria. It in any way change the milk nor ose its vitamine content. Pasteuri- s recognized today as the only cer- ns of safeguarding the public and ly advocated by the leading health ies. After pasteurization the cream does not seem so large; this is be- steurization has a tendency to con- the cream.

milk is pumped from the large stor- through a filter and then over the zer where it is heated to approxi- 146 degrees F. and passed on into storage tank where it is held at perature for 30 minutes. In pas- on the milk is never boiled, as some as that would mean a temperature egrees F.

r pasteurization the milk goes back wer floors where it is bottled automatically and capped. The bottles are washed and dried just before being filled, all this being done by machinery. The bottles are then placed in cases ready for delivery. The cap denotes the grade of milk and tells the date of bottling. From the time the can is emptied to the time the customer removes the cap the milk does not come in contact with the air.



Where Cleanliness Reigns Supreme.

Possibly the most interesting part of the plant is the laboratory. Here the samples are tested for bacteria count and here the butterfat testing is done. Upon examining the little transparent substances the visitor is able to see the bacteria cultures and how the bacteriologist arrives at his grading. Singularly the name Pasteur means pastor or shepherd or guardian of the flock. When one visits the Castanea company's laboratory, he realizes that the great bacteriologist was indeed a guardian in more than name alone. The Castanea Dairy Company sells the Walker-Gordon certified products which has about 2,000 cows, and is the largest certified farm in the world. This milk is not pasteurized but is produced under the most sanitary conditions, bottled on the farm, and handled with meticulous care.

The New Retail Store.

The entire Castanea plant is under the direction of Dr. Charles E. North of the Public Health Bureau of New York City.

There would naturally at times be a surplus. This is made into butter and the skim milk made into cottage cheese which is mixed with cream and packed in sanitary cartons. Another important by-product is creamed cultured buttermilk. This is not tablet buttermilk nor is it milk left in the churn but it is whole milk which is heated to 180 degrees. Culture is added, then it sets until it reaches the right degree of acidity. It is then thoroughly agitated and immediately cooled and bottled. A high grade of whipping and coffee cream are also sold by the company.

The Castanea company was founded by Henry Comfort in 1905. Mr. Comfort's

CLEVER DAIRY PRODUC ADVERTISIN

How Manufacturers and Dealers A
Using the Printed Page to Carry The
Sales Messages to the City Consum

By JOHN T. BARTLETT

Is your baby's picture here?
NORTHLAND MILK

CASHING in on the universal appeal of the new and unusual, clever dairy products advertisers have departed from the ordinary in advertisements, and adopted stunt and other interesting publicity ideas. Two incentives to employ new, different advertising methods exist. The first is the recognized special interest which the public has in new things—in news. By and large the enormous number of magazines, newspapers and books which are published cater to this appetite for news. This magazine, in fact, is in response to news information about the dairy products industry, of special value to men and concerns operating in it.

Aside from the news appeal, the new and different advertising idea may have special effectiveness otherwise. It may contain in unusual ways that precious thing—pull.

Try a glass of Milk at noon every day for a month and see how well you'll feel
WESTERN MARYLAND DAIRY
WESTERN MARYLAND DAIRY
Irvin D Baxter - Chairman of Board

THE world is fast learning that fresh cow's Milk is the greatest food for promoting health. So much so that if Milk is lacking in the diet the human frame cannot reach its highest development. The business man or woman who must always be alert to be successful, should eat a light lunch at noon and drink one or two glasses of Milk. Milk supplies the energy and strength you need without taxing your digestion. Try a glass of Western Maryland Dairy Milk every day for a month and see how well you'll feel.

Do all new ideas in dairy products advertising "work?" Only a percentage do, of course. Nobody is keen enough in dairy products advertising, or any other advertising, to infallibly create successful new ideas. For new plans, however, this much is to be said—among them, quite often, appear most unusual successes. Every dairy products advertiser should feel under the ne
of trying out new things continuously, if only
successor ideas for old ones which wear out.

Weber's, Indianapolis, have a splendid trad
for bottle cap use. This trade mark is also fe
from time to time, in newspaper advertising.

The design is a circle, within which, with a
band between, is an inner circle. reverse plate
a picture of a husky infant. Upon the white band
wording, "Weber's clarified, pasteurized, standa
milk."

Every cap thus embellished advertises esp
Weber's milk for child use. The advertiser also fe
the trade mark in advertising. One message, tw
umns by nine inches, placed the trade mark cap i
siderably more than half life size at the top, with
tle of milk inside it. The single-word heading
"Mothers ——."

This message followed, in two paragraphs of t
large size:

"To convince yourself of the excellence of W
milk, you need to observe the sturdy, good health
children growing up on this better drinking milk.

"To further substantiate our claims, we urge
acquaint yourself by personal observation of the
sanitary methods and equipment used in our plant.

Weber's has a slogan based on age—"44 conse
years in Indianapolis."

Southern Dairies of Florida dares to use u
curiosity-arousing copy. An advertisement thre
ums by 11.5 inches, headed, "Biggest Business W
Backs Largest and Livest Organization," surely
its alliterative beginning that which will tempt w
readers to go on.

The answer comes in the first paragraph:

"Anyone versed in statistics can tell you the bi
business woman in the United States is THE C
and she is rapidly assuming a position of leadersh
the city of Miami."

The copy which follows, extensive, is planned t
peal to the patriotic in newspaper readers. Here
concern which is accomplishing big things for Fl
farmers. The "biggest business woman" figure,
which the advertisement started, is continued, thus

"The many country homes of this big bus
woman who mothers the gigantic dairy industry h
be looked after first—and this was done by Sout
Dairy experts. So well was this source of milk s
looked after that Southern Dairies has already
between three-quarters of a million and a million d
for milk produced in the section around Miami
Palm Beach. It has brought prosperity to the
farmers of this section, and the dairy farmers
motored to Miami with the proceeds. At the crea
plant, a large force is constantly employed, with a
roll of $30,000 a month—and this is spent in Miam

"Fuel and supplies for the plant, to keep it and very system in operation, have released another lion dollars in the city.

:ause it operates five Florida plants, the organi- as elasticity of supply and demand which enables ke all local production, assuring constant stabil- price to the dairy farmers and a never-failing to the city, and the encouragement of a big business to stimulate constantly increased pro- ''

ker's Riverside Creamery, Laredo, Tex., believes specific, in advertising. Advertising the qual- s ice cream, "Cleanly made from the purest in- ts," it continues—"Rich cream from our own Jersey purebreds, vanilla from the finest Mex- nilla beans, chocolate from the cacao of Caracas sh fruits direct from orchard and field."

inviting old friends and new to visit the new he advertiser declares, "Our ice cream maker ster of his art, and we want you to know him lly."

is putting the specific suggestion in copy.

appeal of photographs is being used by a quite ng number of dairy products advertisers. Con- togravure sections alone.

gravure presents the photographs with unusual and charm. Western Maryland Dairy, Balti- pitalizes this fact in a large space advertisement g, primarily, to business people. Here we have miling, go-getter in the pink of health, about to glass of milk. A bottle of Western Maryland shown. "Try a glass of milk at noon every day onth and see how well you'll feel," is the head- erse plate presentation.

mortise is found the persuasive statement, "The man or woman who must always be alert to be ul, should eat a light lunch at noon and drink two glasses of milk. Milk supplies the energy ength you need without taxing your digestion. lass of Western Maryland Dairy milk every day onth and see how well you'll feel."

other advertisers presenting the appeal of roto- make their advertisements "baby" messages. nd Milk and Ice Cream Company, Des Moines, e question, "Is your baby's picture here?" In vo columns by five inches, around the border, han 14 smiling baby faces, all smiling, are shown. e's a "kick" in this advertisement!

Fairfield Farms, Baltimore, shows thus in large space Fairfield baby number 511. The caption introduces a sturdy young fellow weighing at eight months no less than 28 pounds. This photograph reproduction is a large one.

The advertising text includes several interesting statements. There are two slogans, "The Perfect Food For Every Age," and "Famous For Babies." Two other statements with sales-making influence inform the reader that plants are always open for her inspection; further, "A Fairfield Farms wagon passes your home every morning before breakfast."

There is appeal of a different sort in a milk-for-health committee advertisement at Ft. Worth, Tex. Growing children need milk, the heading declares. There is reproduced the photograph of a large group of school children. A striking statement is that 46 per cent of the school children are underweight! In all capitals the message declares "Milk Will Build Them Up."

There is abundant advertising competition in dairy products—which means, for one thing, there is strong incentive to use new, different appeals. Judging from the survey made by the writer, dairy products lend themselves unusually well to distinctive and "different" advertising. Probably any individual advertiser can be original, and productively so, who will study his product with sufficient determination.

MILK ALSO BYRD'S FAVORITE BEVERAGE.

"He chatted with his hosts, and drank a glass of milk before retiring."

This is the Associated Press report of what Commander Byrd thought most essential when he was rescued from his good ship America, landed in the sea 200 yards off the Normandy shore.

Lindbergh, probably less tired than Byrd, wanted milk and a bath before retiring; Byrd just wanted a glass of milk.

What they drank is an unfailing indication of what they are. It tells the reason for their ability to stand the test, endure the strain and win the race.

There is no doubt as to the importance of the diet factor in the success of many men, less doubt now than before the real value of milk and milk products were scientifically analyzed and classified. It takes, however, a Lindbergh and a Byrd to make the emphatic demonstration of these facts for the guidance of all who would emulate their stamina, their manhood, and their success.—A. M. Loomis, Secretary, American Dairy Federation.

DAIRY PRODUCTS COMPANY MAKING STEADY PROGRESS.

In adding new equipment to their plant that has greatly increased their production capacity, the Dairy Products Company, 219 East Fifth St., Dayton, Ohio, has taken another step that keeps them among the leaders in furnishing dairy products to the people of Dayton.

This company recently installed a new pasteurizing machine that has a capacity of 1,200 quarts per hour. The machine is equipped with six 150-gallon tanks that are filled, drained and refilled automatically and in which the milk is pasteurized thoroughly.

John N. Gibson, the president of the company, has been able to anticipate future needs of the company and today this plant stands as the most complete dairy plant in the country.

Helping Their Patrons to Produce Better M

Big Michigan Firm Grades Milk by Bacteria Count and Sediment Test. Increases Number of Patrons, at the Same Time Accomplishes Real Progress in Quality Improvement

AT LEAST 60 per cent of the 393 producers that supply milk to Mead Johnson & Co., Zeeland, Mich., receive a bonus for delivering milk with a bacteria count below 100,000 per c.c. and with a sediment test grade of at least one or two. This was their record for May, 1927, a year after adopting a bonus plan.

The Mead Johnson system is to take bacteria counts by the Breed microscopic method three times each half month, and to make a sediment test at least once within that period. All samples are taken direct from the producer's can of milk as it is delivered, and tests are immediately made. At the end of each half-monthly period reports are sent to each patron showing how his milk graded and whether he has earned a bonus. If the sediment test has run three or four, the disc is attached to the report to emphasize the importance of clean milk. In cases where a bonus is granted, however, the disc is not attached.

Fieldmen Help Patrons.

If the bacteria count is below 100,000 for two of the tests but is above 100,000 on the third, then the patron is not granted a bonus. He must deliver a constant good quality of milk. The company is doing much to make it easier for the producer to deliver clean milk of high quality. They send out a monthly letter in which they tell means to keep dirt out of the milk and to keep the bacteria count at a minimum; and in addition to this they employ one full time and two part time fieldmen. The full time man works mostly with those who do not regularly receive a bonus. He does, however, make it a point to visit each farm at least twice a year.

The Mead Johnson & Co. plant at Zeeland, Mich.

Of the work of fieldmen, R. F. Keeler, manager of the company, explains:

"Previous to the inauguration of the present system, we had our own fieldmen scoring the farms and trying to instruct the producer in the care and handling of his milk. In addition there was inspection made by the Chicago Board of Health. These inspectors and instructors were looked upon with suspicion by the producers, and the inspectors were treated more or less like policemen and necessary evils. It was obvious that the appearance of the milking stool had very little bearing on the quality of the milk. Today, if a produce
to get the bonus, he sends for the fieldman t
him what is wrong, and in general, the relations
tween the two has undergone a radical change."

During the months of February and March,
series of meetings was held with an attendance o
30 producers at each. These conferences were
an attempt to prepare the producer to deliver a
quality of milk in the future. One of the topics a
was the relation of atmospheric temperature to th
ber of producers receiving the bonus. The com
looking forward to being able to present to the
definite data at other meetings to be held next

System Wins Farmers' Respect.

The farmers who send milk to Mead Johnson
have learned that the grading and bonus syste
them is a substantial institution. Only a few yea
however, there was little respect for the gradi
tem, because so many companies had started i
almost immediately abandoned the idea. And so
been in the face of keen competition that this co
has broken down the prejudices against grading m
and has gained the confidence of their patrons.

Just how well they have accomplished this
seen from the accompanying table. It shows a co
son of the records for May, 1926, when the te
started, and May, 1927.

	May 1926
No. of producers supplying milk	290
Percentage of these producers receiving bonus	39
Percentage of these producers receiving the different grades in the sediment test:	
Percentage with grade (1) sediment	11
Percentage with grade (2) sediment	32
Percentages with grades (3) and (4) sediments	57
Percentages of samples examined which were in the different bacteria grades:	
Percentage of samples in grade (1) bacteria	65
Percentage of samples in grade (2) bacteria	18
Percentage of samples in grades (3) and (4) bacteria	17

It will be seen from the record that the num
those receiving a bonus has increased more in p
tion than has the number of patrons. It shows als
while most of the producers send in milk that
"2" in the sediment test, an increasing perc
falls within the bonus requirement. Finally, th
a very marked decrease in the number who are se
in milk that grades "poor."

Consider Probation Plan.

As for the bacteria count, most of the farmers
used methods which make their milk fall consis
within the "less-than-100,000" class. Accordi
present plans, a period of probation is to be inst
for those who fail to attain the bonus requirem
proportionate number of times, yet who are inte
in bettering the quality of their milk.

Of the general effects of this bonus and grading
the manager reports that there is, as a result o
system, an increased interest in dairying in that lo
Many of those who have thought to abandon the

act, one of the keynotes of the success of this a monthly letter to patrons. Each is snappy, information, and chatty. Here is the way one out in July, 1926:

> s are pigs, and milk is milk with many people. They very little difference in quality of milk from a san- andpoint. To these people milk is good until it thick or tastes sour. Because milk changes very appearance till it is very sour, they cannot under- iality in what appears and tastes like good milk. otatoes or moldy grain is very easily seen and qual- e readily determined at a glance. While quality in nnot be ascertained by sight, by laboratory means measured more accurately than quality in potatoes
>
> **Good Dairymen Market Clean Milk.**
>
> quality of your milk depends on you, the same as clothes depends on the tailor who makes it. You care to buy a suit of clothes in which the seams sewed or which had holes in the pockets. A suc- ailor doesn't make that kind of a suit, neither does cientious dairyman produce milk that is comparable y with a suit that has holes in the pockets or that wed seams."

the writer goes on to emphasize that milk is at quality when it is drawn from the cow, and the y to keep the quality up is to keep the dirt out temperature down. One of the most important e explained, is to clean all utensils thoroughly scalding. Then to scald them and thoroughly m is an effective and inexpensive method of utensils sterile and sweet smelling.

e August letter he attacks the problem from a t different angle, but just as interestingly. He that the cow's milk was intended by nature ed direct from the cow by the calf. Unlike veg- eggs and grains, milk has no protective coat, ot in a sealed package. Such a handicap lays rly complete food open to the work of fungi, , and to contamination by dirt. Then too, he en though all bacteria in milk are not harmful, to assume that they are and do all we can to their growth. Cold water rinsing and ample are good antidotes for bacterial growth.

subject of summer feeding is one not too far from the patron's letter. And along this line to supplement grass pastures and the like are ed.

a line of bold face type reading, "Clean cows ean milk and more milk," the November letter zes the convenience of clipping cows to keep an. In this paper we find also some facts shown ew bonus system. They are that "during the f October 16 to October 31, there were 185 pa- o secured the bonus. Of the remaining patrons, d have had the bonus if their milk had been "

Cleanliness is Winter Problem.

they point out that producing quality milk dur- winter is chiefly a matter of keeping the cows clean, and that milk kept at a low temperature will keep the bacteria count down.

It has been the object of Mead Johnson & Co. to encourage producers to deliver milk that is above the average in quality. At the same time they needed to increase the number of patrons. Obviously, this company has succeeded remarkably well, showing within one year an increase of almost fifty per cent in the total number of producers delivering milk to them. Furthermore, during that period a steady improvement in quality of milk was brought about.

Even though a few producers did not show a desire to co-operate and produce better milk, there were plenty who were only too eager to do so. Mr. Keeler explains that, "although it is practically impossible to get 100 per cent of the patrons on the bonus list, the results to date have been far better that we had hoped for. As a rule, we find that the producers with the smaller herds are harder to interest than those with the larger herds."

Wins in Spite of Prejudice.

These results have been accomplished in the face of competition, and in a territory prejudiced against milk grading systems. It is another example of how the untiring, wide awake milk dealer can succeed and at the same time benefit his community and his patrons.

⁂

SOUR MILK CHIEF DIET OF STRANGE MADAGASCAR PEOPLE.

An ideal country for tramps has been discovered by Dr. Ralph Linton, leader of the Captain Marshall Field expedition to Madagascar. The expedition has found strange tribesmen who never bathe or wash their clothing. They sleep on carved wooden pillows and subsist chiefly on sour milk. Instead of washing their garments they soak them in grease.

Head hunting is practiced by these Antandroy and Mahafaly tribesmen and a man's wealth and importance is attested to by the number of heads of enemies he has suspended on a rack outside his residence.

The tribes are wealthy. Captain Linton speaks of ceremonies he was permitted to attend where the women wore gold jewelry worth hundreds of dollars. The natives capture fish by the use of cleverly devised wooden decoys, with flexible horn fins.

The region where these strange people live is in the midst of tidal swamps and is extremely unhealthful. A white man could not long survive there. All the waters are infested with crocodiles which are so numerous and so vicious that the women of the tribe, who do most of the work, get water from the pools by using a dipper on a 10-foot pole.

The tribesmen have developed an elaborate system of drum language and Captain Linton says they can communicate over long distances by the use of signal drums.

⁂

OHIO MANUFACTURERS TO PLAY AT CEDAR POINT.

The fifth annual meeting of the Ohio Dairy Products Association will be held at Cedar Point-on-Lake Erie, Sandusky, on Thursday and Friday, July 28 and 29. You are cordially invited.

⁂

MUST MAKE NECESSARY INSPECTIONS.

It was decided at a conference at Ottawa, Canada, recently, that Canadian authorities will be required to make the inspections necessary to meet requirements of American laws respecting shipment of milk and cream to the United States.

One of Wisconsin's Finest Dairy Plant

Big Plant in Fond du Lac Doing a Nationwide Business in Eleven Different Dairy Products. Drying Equipment Recently Added

ONE of the finest and best equipped dairy plants in the country is located in Fond du Lac, Winnebago county, Wisconsin. It is owned and operated by the Galloway-West Company, an organization for many years identified with the development of the dairy industry of the Badger State.

Morris West is president of the company, E. C. Galloway is vice-president, I. C. West is secretary, and T. C. Ebbernau is treasurer.

Products of this fine plant find sale in many states of the Union. Shipments of sweet cream go to several Eastern cities, and ice cream mix finds a ready sale in Chicago and many other cities in nearby states. One hundred and fifty 100-pound bags of sugar are used daily in preparing ice cream mix.

In one day recently 240,000 pounds of milk were received and used in making the eleven different products put on the market, of which 157,000 pounds were taken in at the Fond du Lac plant. Two oulying plants supplied the balance.

All milk comes from tuberculin tested cows, so the products they produce find ready admittance to any market.

Enormous sums of money have been expended by the Galloway-West Co. to improve the quality of the milk produced by its patrons. The company goes so far as to build milk houses for its farmers, allowing the farmer to pay the actual cost in small monthly payments.

A visit to this fine plant is an education in itself. There one finds efficiency on every hand—efficient capacity, efficient equipment, efficient methods, and, of course, efficient management.

Just recently the company has added powdered milk equipment, and a large su mof money has been invested to make this department in keeping with the balance of the business. A large new addition contains the drying chamber, which has a capacity of 41,241 cubic feet.

The drying chamber has a diameter of 28 feet, and is 28 feet in height. Its entire interior, including the floor and roof, is lined with tin. Human hands do not touch the product at any time during its transformation from the fluid to the solid state, and but two men are required in the manufacturing process. An important part of the equipment is the blower system used to provide the drying the atomized milk particles into powdere This system provides what is known as a "ba draft" and is the first of its kind installed by th Rogers Company of Detroit, manufacturers of the ment purchased by the Galloway-West Company probably the only one of its type in use in the States at present.

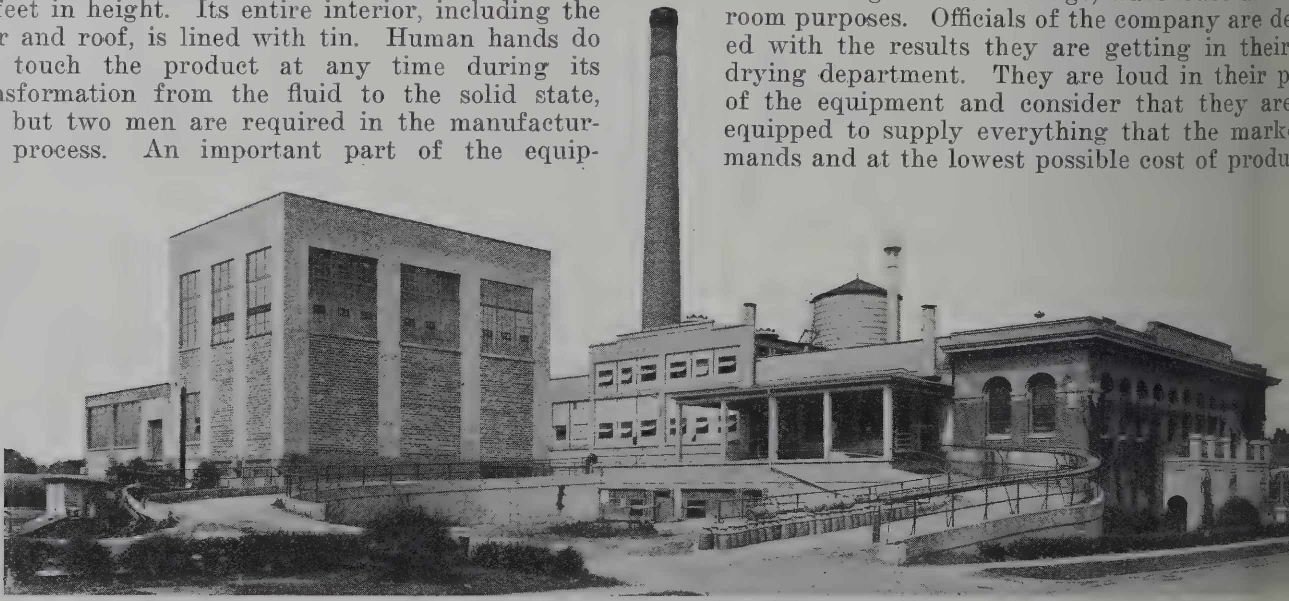
The air intake is on the third floor of the nev tion which houses the powdered milk manufa equipment. The air is first drawn through an oi which purifies it. The oil filter is built in section of which contains steel wool dipped in oil. Afte milk run, one of these sections is removed, wash again immersed in oil before being replaced in th rack.

From the filter the air passes into a heat gen Through this generator, outgoing air from the chamber is being circulated about cold air pipes this method the cold air is heated to an apprecia tent before reaching the heating coils.

The heating coils are similar to those used in h a building. Part of the coils use exhaust steam wh others use live steam. After the fresh air has been in these coils it is sucked through a large tube in drying chamber where it shoots up to dry out th being atomized at the top of the room.

The manufacturing equipment at the Galloway plant is guaranteed to handle 500 pounds of pow milk per hour, but as high as 750 to 800 pounds pe have been run through. It is estimated that 1 pounds of skimmed milk will produce 8,500 pour powdered milk.

The addition erected by the Galloway-West Co for its powdered milk manufacturing equipment no provides a plant 52 feet high and 47 by 46 feet in dimensions, but also a two-story, 46x48-foot addit its engine room. The second story of the engine addition is being used for storage, warehouse and room purposes. Officials of the company are de ed with the results they are getting in their drying department. They are loud in their p of the equipment and consider that they are equipped to supply everything that the mark mands and at the lowest possible cost of produ



Galloway-West Company Plant at Fond du Lac, Wis.

Dairy Clubs Entertain British Envoy

Representative of World's Dairy Congress Meets Dairy Leaders in Milwaukee and Chicago and Tells Them About Plans for the Big World's Dairy Congress in England Next Year

A. EVANS of London, a director of the World's)airy Congress, accompanied by Mrs. Evans, is in he United States in the interests of the big dairy to be held in his country next year.

Thursday, July 7th, Mr. and Mrs. Evans were ests of the Wisconsin Dairy Club in Milwaukee, the following day they were entertained by the al Dairy Club and the International Association k Dealers in Chicago.

both occasions Mr. Evans paid high tribute to terprise of American business men. In telling of fferent experiences he had met up with in this y he repeatedly said, "Of course, we don't do it ay in England."

ou do everything on such a big scale," Mr. Evans I am not surprised that you extend to Mrs. Evans such a generous welcome."

Evans is not an orator, and he doesn't pose as He is just a successful business man who makes a tudy of the dairy business and who can, in a most ting way, tell his hearers what he knows and the sions he gains. He is a director of the United , Ltd., which supplies 80 per cent of all the milk London.

ngland has adopted American methods of milk dison for large cities in every detail," Mr. Evans "Not only that, but we believe that we have made mprovements, and we want your American dairy look our plants over when the World Dairy Cons held in London next June.

merica has taken to the use of milk because you vast wholesale supply. That is one of our prob England—raising fine herds like yours. While American cities, such as Chicago and Washington, eir entire supply of milk from tuberculin tested there are not more than 100 such herds in England. spite of the fact that most people think of Eng a strictly industrial country, farming is our basic y, as it is the basic industry the world over. Engs the home of several of the finest breeds of "

cording to Mr. Evans the ice cream industry in d is ready for a great expansion. Very little ice is to be found on the market and when found it nferior quality. Plans are being laid, however, for velopment of the industry along the lines followed country. Eight million people in London alone iting to enjoy good ice cream, like American made am.

Evans emphasized the opportunities that are manufacturers of equipment and supplies in this y who are in position to handle an export business. people have the money and they are waiting to ur goods," said the speaker.

Evans said he was delighted to find, upon arrivthis country, that plans for a World's Dairy Con-Tour were already far advanced. "That is the way ks do things," he said, "and when I learned about our I immediately wrote my colleagues in London se their plans for entertaining American delegates. l of the 100 delegates we were counting on from America I fully expect to see a thousand arrive to take part at our opening session."

Mr. Evans, of course, referred to the World's Dairy Congress Tour which is being sponsored by the Olsen Publishing Company. "I admire your pluck," he said. "You not only take right hold of a big enterprise, but you pick out the finest boat on the open seas. Why, I am astounded!"

His astonishment, however, was one of pleasure. He urged his hearers to join in promoting the tour. "You men all want to go, and the most of you can go if you just make up your minds to do it. You will be amply repaid. When you come, bring the ladies along. In our country we don't take the ladies to our business conferences. Come and show our people how you treat the ladies in this country. Bring them with you, by all means. They will be royally entertained."

Mr. Evans was particularly pleased to see the ladies turn out at both the Milwaukee and Chicago meetings to entertain Mrs. Evans and to learn about plans for the tour. They met a very charming English lady, who is thoroughly enjoying her first visit in America.

As time goes on further details regarding the World's Dairy Congress Tour will be published in the Olsen publications. Readers will be kept posted as plans unfold. The S. S. Leviathan will carry our party, sailing from New York City on June 9, 1928, and arriving at Cherbourg, France, on June 15th.

The World's Dairy Congress will open in London on June 26th and will continue until July 5th. The intervening time will be spent in touring France, Belgium and Holland, under the auspices of the American Express Travel Bureau.

Following the Congress tours will include visits to Holland, Germany, Denmark and Sweden and other countries.

Further details, including transportation costs, additional side trips, etc., will be cheerfully furnished on request.

⁂

COST OF POWER PLANTS.

If you are contemplating building a power plant you will be interested in the following costs recently given in a paper presented before the A. S. M. E. by a prominent engineer:

It is estimated that the cost of Colfax Station upon its completion—270,000 kw. capacity—will be $107.50 per kw. The division of costs for 190,000 kw. capacity are:

	Per cent
Building and foundations	20.1
Boiler plant	16.1
Turbine and generators	15.9
Switchboards, transformers, conduit and wiring	14.4
Piping	6.9
Condensers and auxiliaries	6.8
Draft system	4.9
Condensing water system	4.1
Auxiliary equipment	1.9
Service equipment	1.7
Station yard and tracks	1.7
Coal handling	1.3
Feed-water system	1.3

Reports the Manager Must Get

The Use of Statements for Curtailing Expenses in the Business of Operating a Modern Milk Bottling Plant

By C. L. PEGGS*

IN THIS modern age, knowledge is rapidly taking the place formerly occupied by mere experience. Knowledge, when applied to the operation of business affairs, must be of such a nature, that it will dislose the actual conditions supported by accurate facts and figures relative to cost and selling prices.

With the growth of business enterprises, greater need has arisen for developing adequate means by which to keep those responsible for the operation and direction of business informed of its past accomplishments and its present status. Especially does this apply to the business of today that is compelled to operate under such keen competition that causes the margin of profit to be in many cases very small and indeed in many cases inadequate to promote growth.

Because of this fact, business executives are recognizing more keenly than ever before, the essential part which properly prepared reports play in the conduct of business. This is especially true in the case of reports rendered by accountants to departmental heads, managers and executives, many of whom are apparently lacking in a proper appreciation of the necessity of preparing reports so that they may be easily understood by those for whom they are intended. For a poorly constructed report, though seemingly harmless, may prove to be a most dangerous instrument in the hands of those who use it.

It is the duty, and should be the pleasure of the accountant to prepare statements and reports from the standard of uniform practice with respect to forms, arrangement and terminology as well as satisfaction, and with the all important factor predominating, that of enabling the department head, the manager or executive, if at all possible without detrimental effects, to reduce or curtail expenses, and the accountant should develop a uniform procedure for presenting the financial facts of the business so that reports for different periods may always be comparable.

In the dairy products industry the margin of profits is small compared to that of other industries. It is presumed that this condition arises from the fact that the pioneers of the milk and ice cream manufacturing industries, in determining their selling prices, established a schedule of rates which prevented returns such as are enjoyed by other industries. The difference between purchase price and selling price, termed "spread," has in the case of many dairy products proved inadequate to meet the cost necessary to finishing and selling these products.

These men intended, as is our intention, to net a fair profit on the sale of these products, but accounting, which is the means of presenting to the management the knowledge of the elements entering into business so that effective control may be maintained, was not sufficient in its scope to provide intelligence on which to base sound judgment; a knowledge of the various costs and expenses added to the product as it passes through the various processes to the finished state was practically unknown.

Competition in this industry as well as in all others is becoming keener, and those who know their costs are
the ones who will survive and prosper, because
fact, that through this knowledge they are in a
to reject all undesirable business, they know th
ucts which net the largest returns and they kn
control their selling and distribution expenses.

And now after the products have been pr
and finished under the present stanadard of sc
methods and systems usually found in the averag
and ice cream manufacturing plants, these res
dealers are then confronted with the problem o
and distribution. They realize that in order to
and hold their old customers as well as continue
new ones they must maintain a service that is a
on a par with that of their competitors and t
of successful business demands that this service
erated at a profit. Therefore it is very importa
proprietors or directors are furnished with the ne
intelligence in the form of statements or report
will enable them to closely observe this law.

Schedules of departmental expense, both in
and operating groups, should be prepared in suc
that comparisons of previous periods can be
made. This will immediately bring to the atten
the department head any variation in the expe
operating the department. These schedules shou
show the proportion of expenses to volume handl

Selling and distribution expenses should be re
in such a way or under such a classification that
countant will have at his disposal information th
enable him to prepare statements and reports
various classes and conditions of sales.

In constructing a system of accounting in a ma
turing or processing plant, the aim of the accou
should be, to so build his forms that the items
penses can be charged direct to the product or
tion affected. If this aim is accomplished the accou
will have reduced to a minimum the necessity of a
ing expenses on an estimated basis.

The proper interpretation of comparative ex
schedules or sales reports will provide a means
flecting a very efficient expense control. With ex
properly controlled the problem of curtailment th
volves only the impairment of efficiency. These
ules will furnish data that will enable the execut
determine intelligently whether or not the redu
or elimination of certain items of expense can be ef
without impairing service or production.

Meetings such as this have sustained and pr
gated a continuance of the fundamental princip
accounting, interchange of ideas and practical e
ences of the controllers and accountants whose fu
it is to prepare and submit to both executives and
agers summaries, statements, reports and statistic
formation relative to the operation of milk and ice
plants.

As we as controllers and accountanats endeav
keep pace with the trend of the times and newl
vanced ideas, we are many times confronted wit
expected to furnish executives and managers with
ments and reports that perhaps were not in the vo
lary of our text books or training in accounting
cedure, so it becomes necessary for the controlle
the accountant of today in order to be efficient an

Pure Milk Co.,
West Frankfort, Ill.

eeting the test
of actual, everyday use

WHEN you install a new separator be sure you get *proved* skimming efficiency—*proved* capacity—*proved* mechanical efficiency—*proved* ability to produce churnable cream of high quality.

No separator user can satisfy himself on all these points in a day—or in a month. Any separator worthy of the name should run smoothly and skim fairly clean when it is brand new—but the real test comes after a few months of service.

Likewise any separator will do its best work when milk can easily be kept warm and cows are fresh—but see what it does when conditions are reversed.

Scores of New Series De Lavals have now been in operation for a year or more.

—And the concensus of opinion among users is that the New Series machine is in every way the most wonderful separator ever built. That is the real test—what users say—not what we or any other separator manufacturer may tell you.

We have prepared a folder containing interesting letters from 12 users of New Series machines. Write for a copy.

cessful in his work to continue to study and enlarge on his knowledge of the accounting field.

The accounting department of the milk dealer and ice cream manufacturer of today, while perhaps in some ways are not unlike the accounting departments of other industries, yet, there are many intricate and perplexing problems that the accountant is called upon to solve, for the reason that the sales of the milk dealer and ice cream manufacturer are made up and composed of small packages of dairy products to be delivered to the consumer 365 days per year, and the shut-down is practically unknown.

These distinct conditions prompted some members of the International Association of Milk Dealers to undertake the tremendous task of the establishment of a uniform cost accounting system that would not only assist the controller and accountant to render an improved service to management but to be enabled to determine the cost of the individual unit of the dairy product.

Most of you perhaps are familiar with the proceedings, development and success of the project; of how the manual was first published by the milk dealers; and afterward the ice cream manufacturers prepared a much improved manual and by their combination the International Association of Milk Dealers have adopted for installation the uniform cost accounting system for the milk dealer and ice cream manufacturer or a combined form for the milk dealer and ice cream manufacturer.

Of course, the great question that predominated in the minds of the members of the association was "Would it prove successful?" And it is with pride that those who have had experience in the application and operation of the uniform cost accounting system both the milk dealer and the ice cream manufacturer can justly say that "It is a real success," when properly installed, operated and applied.

Especially to the controller and accountants of the milk dealer and ice cream manufacturer should the accomplishments and achievements be of particular interest, as the uniform system was built by the controller and accountant within the industries.

So in order to effect the foundation and basis for curtailing expenses it is absolutely necessary that the statements are of such character that will reflect the actual operation and condition of the different departments necessary to successfully operate a milk plant or ice cream plant.

As members of the Controllers' Council we are firm in our belief that we are making a great contribution toward a successful end and have been greatly assisted by the other groups, namely the purchasing section, production section, sales management, engineering and administration sections.

The controllers and accountants of the milk dealer and ice cream manufacturer who are operating the uniform system of accounting must certainly feel a sense of great satisfaction and gratification to be enabled to present to executives and managers reports in detail that actually disclose the cost of the individual unit of product, schedules of departmental expenses, the profit and loss on each unit of product sold and the profit and loss from operation of each individual route, as well as properly constructed financial and depreciation statements and many other reports and statements that are vital to the operation of a milk or ice cream plant and most valuable statements and comparisons for sales and distribution control. And the statement that perhaps is the most important insofar as departmental control is concerned, is the statement that will develop ways and means to control the expenses of any one or all departments. Therefore it is necessary to operate a
that will give the flow of product through the pl
natural group of expense, and the segregation
penses to departments and the cost of the unit
uct through each department and finally the cost
of finished product placed in the package for d
Then with this information readily and promp
nished the matter of application of costs relative
ing prices becomes greatly simplified.

And from the knowledge attained through
perience of systems adapted to the milk and ic
industries we feel confident in saying that the
cost accounting system is beyond the question of
the greatest asset that controllers and accountant
place in the hands of those engaged in the milk
cream industries.

NIELSENS PRODUCE ACIDOPHILUS MI

Thirty-five years of intensive study on the su
milk, including six years spent in research work
has given N. D. Nielsen, biological chemist, 1114
Ave., Pittsburgh, Pa., a thorough knowledge of t
ject. Mr. Nielsen, at the present time, is conduct
Nielsen Dietetic Laboratory, with his son, S. D.

Fifteen years ago the elder Nielsen first prop
theory of milk. This theory held that beside the
hydrate, fat, and casein to be found in milk, there
a gland secretion which makes eighty-five per cen
bulk, and is the ingredient which aids in the met
of the food portion.

Clinical findings over a long period of years
stantiated Mr. Nielsen's theory, and it is gener
cepted as a fact. In the laboratory fitted up at t
of the Nielsen residence, research over a period
enabled them to separate the culture of the glan
tion.

After nurturing the culture for three and
years it was finally possible to produce it in com
quantities, as is now being done, under the name
sen's Acidophilus Milk, consisting of the origin
mones from the milk.

Just recently the Nielsens have produced a be
of pure fruit juice, combined wth their acidophil
which proved successful when oranges and the mil
combined.

The Nielsen laboratory is a completely mode
thoroughly scientific plant, and the liquid is han
glass containers from the time it comes to the lab
as milk from the cow, until it is bottled for the c
ers' use. In addition to their schedule of prod
the Nielsens are constantly carrying on research
in the field of their choice.

Acidophilus milk, which has now been distr
all over this country and in Europe, will be foun
ficial in connection with a large number of ailme
is claimed by the originators. Acidosis, indigestio
tric and duodenal ulcers, gastro-intestinal trouble
gish liver, dizziness, insufficiency of pancreatic
diabetes, kidney and bladder irritations, auto-in
tion, pernicious anemia and other diseases hav
benefitted by the use of the liquid.

re Space Available at Cleveland Exposition

Additions to Area Originally Set Apart Make it Possible for Management to Accommodate More Applicants for Space. Total Exhibit Space to Exceed That at Detroit

ARNEST effort is being made by the Dairy and Cream Machinery and Supplies Association, sponsor of the great Dairy Industries Expo- Cleveland in October, to provide at least a sub- part of the display area which is now being re- by would-be exhibitors.

leasing of space was opened by the association mber houses some two months ago, practically e show as originally planned and laid out was tely reserved. Requests for booths from non- houses have been received practically daily t time, according to the association, and it has, ely, been possible to re-arrange the plans for sections of the area, to permit the inclusion of ditional booths.

now clearly evident that that part of the total for area, which the capacities of the various sec- the Cleveland Public Auditorium building unit mit the association to meet, will constitute an ex- exceeding, slightly at least, the area of the ous Detroit, 1926, Dairy Industries Exposition.

Many New Machines.

ciation headquarters in New York City are y for a statement that the Cleveland exposition, out its week of October 24-29 inclusive, will to the dairy products industries a remarkable of new, or strikingly modified and improved, f machinery, materials, equipment, supplies, etc. bers of the association staff in recent trips out different parts of the country have ascer- that a number of very important developments inery, for example, will be completed before the d will be displayed there for the first time. Some e developments have already progressed far in experimental construction and tests to have prediction that they will be of startling interest products manufacturers generally.

Important Educational Section.

Cleveland Exposition will be characterized by a table educational division than have its predeces- display of considerable scope and size is now in tion at Washington by bureaus of the U. S. De- t of Agriculture. The National Association of am Manufacturers will have a large booth. The n Dry Milk Institute will have an educational headquarters. The National Creamery Butter ' Association will both have an official headquar- oth and will sponsor, at the exposition, an im- national butter contest.

Wisconsin Day — Wednesday.

Wisconsin Butter Makers' Association will hold l meeting of its membership at the exposition on sday, October 26, on which day an important del- of Wisconsin industrialists, leaders in the dairy s activities of the state and leaders in other fields ill inspect the exposition.

In recognition of these events and of Wisconsin's importance generally, as a dairy products state, the Dairy and Ice Cream Machinery and Supplies Association has announced that the day will be officially designated, in the program of the exposition, as "Wisconsin Day."

Hotel Reservations.

A recent checking of hotel reservations in Cleveland by a representative of the Machinery and Supplies Association, shows that the principal down-town hotels have already pledged room accommodations to visitors to the show, numbering in the thousands. Room reservations should be made promptly, according to the association, in order to avoid last minute narrowness of choice of accommodations.

A few of the hotels have been selected as official headquarters by different trade groups.

The Hollenden will house the convention sessions of the National Association of Ice Cream Manufacturers, which meets this year October 24-27, inclusive, in the city of the exposition.

The Dairy and Ice Cream Machinery and Supplies Association will make the Cleveland its official headquarters.

At least informally, it appears that the Statler will become a center of reservations for members of the International Association of Milk Dealers—which will conclude its annual convention the latter part of the week preceding the exposition, in Columbus, Ohio, four hours ride by train from Cleveland.

Many reservations are being booked by the Winton Hotel, the Olmsted, and a dozen or more other establishments of good class, either within the business center of the city or upon its edges. One new hotel, less than a block from the entrance of the exposition, the Auditorium Hotel, will open its doors in August.

* * *

LANSING DAIRY COMPANY TRULY A LOCAL CONCERN.

There is no organization in all of Lansing, Mich., which is more distinctly local in character than the Lansing Dairy Company. Its supplies come from the surrounding farms, all of its products are locally prepared and handled, and its ownership is in the hands of Michigan farmers and Lansing business men. It sells to Lansing housewives and appears finally as a great part of Lansing cooking.

The Lansing Dairy has had an interesting story of rapid growth in the four and a half years of its existence. Starting on a small scale, it has made use of modern methods and the most approved equipment from the very first. The Lansing Dairy invites public inspection at all times.

Just A Bath and a Bottle of Milk

Milk Dealers the Country Over Seized Upon Col. Lindbergh's Famous Request to Put New Life Into Their Advertising Campaigns

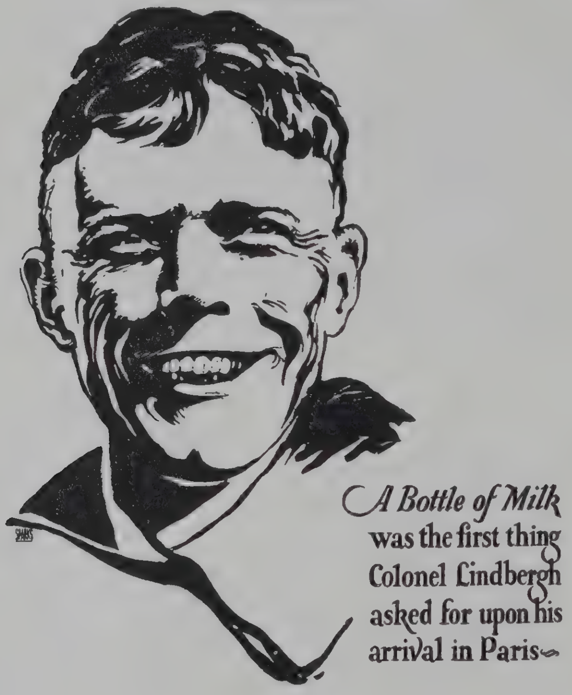
IN OUR last issue we voiced the opinion that milk dealers generally would fail to capitalize on Col. Lindbergh's request for "a bottle of milk and a bath."

We ventured to say that milk people are not in the habit of seizing on timely opportunities to popularize their product.

Perhaps we knew when we published that article that the progressive men in the business would lose no time in using our young hero's endorsement of milk in their local advertising.

Perhaps we just wanted to start something.

Reproduction of a full page advertisement in St. Louis newspapers.



SHARS
A Bottle of Milk was the first thing Colonel Lindbergh asked for upon his arrival in Paris

PEVELY SELECTED MILK *is the* BEST

Anyway, we got what we started out to get. We got evidences—lots of them—that milk dealers the country over did the very thing that we prophesied they would not do.

We have been flooded, yes literally deluged, with copies of advertisements torn from local papers. Readers have seemed to take special delight in proving an editor wrong.

Don't waste sympathy on us, please. We are "dee-lighted," as the great Teddy used to say, to be proved wrong.

Space will not permit reproducing all these advertisements, but we are going to let you read a couple of them. We are also going to let you read a letter from one of the progressive firms that lost no time in setting us right. Here it is:

Your remarks on page 27, first column, June issue Milk Dealer has caused us to write this letter and e few copies of the manner in which our company us Lindbergh's statement on his arrival in Paris.

"We want the wide world to know that we are in the MILK BUSINESS and, although we admit sometimes we are caught napping, this is one time that we are of the opinion our advertising **went over big.** No advertising that we have ever done has caused as much comment to come back to us as this advertising on Lindbergh.

Yours for timely
advertising,
PEVELY DAIRY
COMPANY.
By J. J. Wasser.

GREENVILLE DAIRY COMPAN

J. C. Joslin, Manager

Canal Street, Green

Atta boy, Mr. Wasser! You not only seized the best opportunity that has come your way in a decade, but you also have spunk enough to tell an edito he is wrong. More power to you.

Our good old friend John Joslin, Greenville, P reminds us that he is not asleep at the switch. He us an ad clipped from his local paper.

These two specimen advertisements not only that some milk dealers are alive to their adve opportunities, but we submit that they are also good advertisements. They have attention arresti peal and that is one of the essentials of a good ad.

CLAIM MILK WILL ADD WEIGHT AND HE

According to Herbert C. Hooks, secretary o Evaporated Milk Association, Pittsburgh, Pa., mor 75,000,000 pounds would be added yearly to the of school children in the United States and 18,9 inches to their combined height by the addition extra pint of milk a day to their diets.

"Actual tests made on 500 children of schoo show that the addition of a pint of milk to a diet satisfied their appetites converted an average gain of weight of 3.85 pounds per child into one o pounds and produced an annual increase in height 1.84 inches to 2.63 inches," said Mr. Hooks.

TWO WISCONSIN FIRMS MERGE.

On July 1 the East Side Capital Dairy Compan the Mandt Dairy Company, Madison, Wis., consoli under the latter firm name. Increased facilities for ing the patrons of the two companies will insur success of the new organization.

STROUS ✓ ✓ DURABLE ✓ ✓ WASHABLE ✓

WHITE PAINT

Thousands of industrial plants have found that Barreled Sunlight best combines the qualities they want in interior paint—and at the lowest cost per square foot of surface painted!

UARANTEED to remain white longer

HE CLAIM of lasting white- ness that we make for reled Sunlight is backed by definite guarantee:

Barreled Sunlight will re- in white longer than any ss paint or enamel, mestic or foreign, applied der the same conditions.

Practical proof of this quality r a period of years is one son why Barreled Sunlight is most widely used white nt for industrial interiors.

Another reason is *durable anliness.* The surface of reled Sunlight is so smooth it 't hold dirt embedded, and shes like tile. Repeated wash- does not wear it away.

And because this lustrous paint reflects light of just the right quality, it greatly improves working conditions.

With all these advantages, Barreled Sunlight *costs less per square foot of surface covered.* Extremely opaque, it covers a larger area with a given quantity of paint; and containing no varnish, it flows so easily with brush or spray that there is a saving in labor hours.

Sold in 55- and 30-gallon churn-equipped steel drums, and in cans. Where more than one coat is required, use Barreled Sunlight Undercoat first. See coupon.

Face-to-Face with Merchandising Comparisons

Actual Results Showing How Milk Industry Fails to Use Its Full Opportunities Where Othe Merchandisers Succeed—Power of Simplicity—Descriptive Merchandising

By CRADDOCK GOINS

THIS matter of selling more milk, now, if you just insist upon direct, face-to-face comparisons, is one of the simplest propositions anybody ever encountered. Which, no doubt, accounts for the great difficulty we experience in getting the right angle!

"The trouble with most magazine merchandising articles," one milk dealer complains, "is they are so theoretical, so far-fetched, so high up in the air, if you know what I mean."

In other words, he means it is over his head. Possibly true. Unfortunately, much we read—and hear—is so filled with suppositions and unknown quantities that we fail to get as much out of them as we might—as we might say, in talking the matter over, face-to-face, heart-to-heart.

All right, that's what we are going to do now; we are going to chat it out, face-to-face, Mr. Milk Dealer, with you on that side of the table and we on the other, and we are going to tell you, in our best conversational style, just what there is to this business of selling, drawing out actual accomplishments by other industries.

A lot of automobiles are sold in this fair and favored land, you readily will admit. You are driving your fourth one now, aren't you? Possibly your fifth one? Or is it your sixth Lizzie?

Many years ago, you know, they sold automobiles. They don't any more. They sell—well, lots of things besides automobiles, these people who make them.

We took a little stroll down the street the other day, just an average main street in an average main-street town, and we didn't have any unusual curiosity. But several things began to strike us between the eyes as we looked over the various billboards lining the thoroughfare.

There were three automobiles ads in a group of nine billboard-advertisements. Did we say auto ads? Our mistake. They were ads **by** auto companies. They were selling—well, one company was selling one definite, concrete thing and it wasted no words, nor time in telling what it was—"POWER." There were just six words in that ad. They all revolved around the one great selling thought—"POWER."

Now another auto company was selling something else—"ENDURANCE." That car manufacturer was sure his car would give good service and hold out longer than any other car in the world—and he tells the people so! Gosh, isn't it simple?

"How long," we thought, "has this good thing been going on? Here we, in the milk business, have been stumbling about in the dark of a primitive business era and haven't yet had enough gumption to pick out the simple selling points of our product. How long has this good thing been going on?"

You buy quite a bit of oil for that Lizzie of yours, don't you, Mr. Milk Dealer? No, as a matter of fact, you don't—you buy something else. One of those ads, paid for by a company making oil for automobiles, fairly screamed out its one compelling sales messag
unmistakable way—"SILKEN CLOUDS." S
quickly, how simply he conveyed his thought!
diately he makes it known that his oil is so
smooth, yet so strong in body, so serviceable, tha
make your car go as though you were traveling o
clouds. Now, it took us several words to expr
thought—and people don't read several word
they are having somebody try to tell them some

The point is this: Other people are taking th
direct, clean-cut route to interest the public's d
their merchandise. When are we going to do i
milk business? When are we going to get righ
to the one expression that will make more peo
more milk?

This one-word business of selling is here to st
a busy world. If you want to sell milk you'v
adopt the other man's selling ways. The public
patience with the word-prodigal.

Many of us would be better off—so-called s
included—if our vocabularies were more limite

"I spent several years studying the dictionar
a famous writer once, "ever seeking to incr
vocabulary, pouncing upon every unusual word
find, looking up every word I encountered in re

"Yes," said an enthralled listener, "and t
counts—"

"And now," went on the famous literatteur,
spent the rest of my life trying to forget all th
usual words and trying to use all the short, sim
scriptive words I can."

The art in anything is in simplicity. This is
larly true of merchandising—in descriptive merc
ing, of a certainty.

The masters of simple speech are our famous
—Mark Twain, O. Henry, Joel Chandler Harris.

Children, you know, are particularly descript
pressive in their narrations. It's because they are

Our small son, a lad of two, awakened the
household just the other night, with a frantic cr
vocabulary, being extremely limited, permitted
express himself in just one word, but it was s
descriptive that the entire household immediatel
his trouble, even before they could wipe the slee
their own heavy eyes.

"Bite!" screamed the little man, and imme
everyone knew he had been attacked by a mosqu
there was no delay in doing what he wanted d
sprinkling him with anti-mosquito spray and in
ing up his unprotected little limbs.

There's a selling lesson, if you but see it. Th
boy wanted to sell his entire household on the
protecting him from that harassing insect that
turbed his peaceful slumbers.

Isn't it simple—just too simple for words!

Yet so many of us persist in retaining that a
fallacious idea of mystery in business. We are p

like Barnum said we were—we like to be fooled. We like our humbug ideas.

The hokus-pokus medicine men of business, the self-styled efficiency experts, can do business no better turn than to get out of the way or impress upon business men the importance of simplicity.

The story is told of three high-pressure salesmen who went to sell a man a locomotive. Now, as you doubtless know, although you haven't bought many locomotives—no more than we, perhaps—as you doubtless know, a locomotive is quite a bulky piece of commerce, and you wouldn't imagine offhand there would be the slightest possibility of selling a man a locomotive without considerable discussion, lasting, say, two or three days. At any rate, you wouldn't think of a sale like that taking place in a chat just before breakfast.

Well, so the story goes, the three wise men of selling science caught a train. They soon recognized each other. Two of the salesmen, bright, alert, snappy chaps who were much given to the sciences and the various angles of selling technique, began comparing notes. They started off by wishing each other well. They then began discussing their individual ideas about methods of approach, ideas upon breaking down sales resistance, creating the buying appeal, the desire of possession, etc., and so on. Then one of them chuckled, "That seedy old boy over there is going to try to sell this same man one of his broken-arches of the rail," he sneered. "Say, isn't that one for the books, though, him that ain't even got enough selling technique to persuade a flapper to buy a pin when her belt-buckle busts! He won't get anywhere. No sirree."

Yet, about the second day, when the two gentlemen of technique were getting ready for the kill, they got together and found out to their consternation that this seedy looking old gentleman already had sold their prospect one of his broken-arch locomotives.

"How in the heck did you do it?" one of them asked.

"Well, I just figured it was going to be a hard job and that I better get down to business right away," the other explained, "and so I just went out to see him, the minute I hit town, and told him why I thought he ought to buy one of my broken-arches—and I knew I didn't have any time to waste, you two boys being here on the ground, and so--"

"Well?"

"Why, I just got busy and sold him without any wast of my words and his time," the other stated.

That's what we are going to have to do in the milk business—get down to business and sell our public without any waste of our words or the public's time! One thing is a cinch. You may waste your words. You may spread all the highly technical matter you want to about milk. You may describe all the component parts. But if you don't put it in short, simple, descriptive language that tells what milk does, like creating POWER, ENDURANCE, SILKEN CLOUDS of happiness and health --then you are not going to take up much of the public's time.

Remember that. You may waste all your words and all your time, but you are not going to waste the **public's** time!

Time is a great treasure. The enlightened public is exceedingly jealous of that treasure.

You be the same way always, Mr. Dealer, both about your treasure of time and your treasure of words.

Make them all selling words. Make them all intensely interesting, gripping words, words that strike at the very soul of a man's interest and hold, hold, hold like death.

Make them pitiless, merciless words—unr
words. Make them words that so describe milk
power, endurance, health, satisfaction—so descri
jewels of life that the onlooker is powerless t
them.

You know, you and the automobile man are
the same thing. So are many other people.
competitors, not you and the other milk dealer
town.

You've got a lot to learn from that boy wh
automobiles, and your first lesson in his art i
plicity, compelling, descriptive simplicity.

Well, you insisted upon it, and there it is,
you like it or not. It's face-to-face stuff, actu
parisons, putting you face to face with what re
chandisers are doing, sparing you nothing, lov
greatly, hoping you will profit from it.

LARGE SHERMAN, TEX., MILK PLANT TO
OPERATIONS OCTOBER 1.

October 1, 1927, is the date set for the openi
of the new milk plant in Sherman, Tex., which w
ufacture condensed milk, powdered milk, but
other milk products. The new enterprise will
milk from five thousand dairy cows from the st
within the period of five years should handle t

would expect not less than the production o
thousand to fifty thousand cows. At the prese
the chamber of commerce is conducting a camp
acquaint the farmers with the coming of the
terprise and to enlist their support to insure a s
milk supply.

The new plant is backed by the Interstate Co
and Refining Company of Sherman, with ample
and prestige gained through a long period of su
years in the manufacture of shortening and other
seed oil products. C. A. Sanford, president and
manager, and A. G. Hopkins, secretary-treasurer
company, have traveled over a wide area of the
States inspecting milk condensing plants and
creameries and studying the dairy situation.

"Gentlemen, to my mind this will be the greates
ment for the advancement of diversified agricul
Grayson county and North Texas, that men of th
ent generation have ever seen and I believe our
will at once get the vision of it," said Mr. Si
manager chamber of commerce, in addressing his
of directors. "Ultimately it will mean more th
cotton crop and is right in line with our slogan o
two payrolls a year on the farm' with which w
already made some progress."

NEW DAIRYMEN'S ASSOCIATION TO BE FO

Harry R. Lewis, commissioner of agriculture, is

very pound saved in
eight of the tank
uals two pounds
pay load —

THUS 99% Pure Nickel Milk Tank construction saves you 2000 pounds deadweight and adds 4000 pounds payload.

The reason for this outstanding advantage is that 99% Nickel is inherently stronger than steel and permits us to use much lighter nickel sheets which results in a nickel tank construction that averages one ton less weight than any units, heretofore, used.

Combine this weight advantage with the sanitary advantages of a one-piece seamless nickel construction and you have two excellent reasons why 99% Nickel Milk Tanks are generally preferred throughout the dairy industry.

Let our engineers co-operate with you.

Eight Reasons of Success Milk Delivery

Practical Suggestions for the Milk
Who is Confronted with the Prob
Keeping Down Truck Operation

By PHILIP L. SNIFFIN

ANSWER these eight questions and you will know how good your truck delivery system is and how much you have yet to do before your costs will be as low as you can possibly get them.

1. Are the vehicles used well adapted to the work they are called upon to perform, with respect to type, size and quality?

2. Is the truck body equipment well coordinated with conditions met in unloading and loading to insure a minimum of idle time?

3. Are routes well planned and arranged to keep each truck on the road as much as possible in the course of the day?

4. Are seasonal and rush period requirements handled in a way that will reduce idle truck time in dull periods as much as possible?

5. Are motor trucks used only on hauls for which they are qualified to do the work more economically than horses?

6. Are cost records properly kept to detect:
   - a. Incapable drivers;
   - b. Inferior vehicles, tires, fuel, etc.;
   - c. Waste in routing?

7. Are drivers well informed on vehicle operation and care?

8. Is the maintenance plan systematic, to insure the very minimum of cost for repairs and overhauling?

Each of the foregoing questions represents an opportunity to cut delivery costs. Together they cover the fundamentals of successful truck operation. Only if the individual owner can answer them all in the affirmative after careful thought may he be assured that his delivery system is not working under a severe handicap.

A review of the experiences of various concerns with motor trucks will reveal one fact of tremendous importance—a wise or unwise choice in picking a particular kind of truck will make or break the success of the delivery system. The most noticeable mistakes are:

1. Selecting a vehicle of inadequate size, resulting in the very expensive practice of overloading. A small percentage of overload with a high quality vehicle is often justifiable. But too many concerns insist on learning through bitter experience that with motor trucks, as with other things, the proverbial "something for nothing" is not obtainable. Investigation shows that a large percentage of the higher unit hauling costs can be traced to heavy repair bills and breakdowns, and these in turn to the practice of overloading.

2. Selectng a vehicle of unproven ability to meet the requirements of the individual owner's business. The selection of a motor truck, to be well based, must be the result of a careful analysis of past performance in the purchaser's own particular line of business. There are vast differences among various makes of motor trucks. Where one may make surprising records in one line of business, it may fall down completely when assigned to th
of another. The importance of careful selecti
be best appreciated when it is considered that
ciation and interest on investment, as well as n
the maintenance and running charges, are dep
on this. Probably as high as 75 per cent of th
operating expenses are influenced by the amount
exercised in selecting the vehicle.

3. Selecting a vehicle of improper type to me
conditions. There are three principal types of
trucks—commonly called the shaft-drive, the chai
and the double reduction. Each has particul
vantages for certain well defined purposes. No
lation should be made without a full considera
each of these types. Factors of dependability,
hill-climbing ability, longevity, operating econom
enter into such a consideration. An additional
eration as far as vehicle type is concerned is t
the wheelbase. Trucks are obtainable with variou
of wheelbase. Often a short wheelbase will add t
ing and unloading efficiency by permitting quic
easy manipulation of the truck in narrow and con
places. On the other hand, there are advantages
gained from a long wheelbase insofar as carryi
pacity and even distribution of the load are conc

4. Selecting a body type not well coordinate
loading and unloading conditions. It will suffice
here that there is a body type to suit every con
requirements perfectly. It may be necessary to
such a body made to order, yet the extra cost in
will invariably be made up for in the saving of t
hicle's time and that of the driver. The matter of
type has been found to present a substantial oppor
for economy.

Keep Trucks on the Road.

Inasmuch as so large a proportion of the total
ery cost lies in the items of interest on investmer
surance, garage cost and drivers' salaries, it c
seen that much of the difference in the unit cost be
one concern and another may be attributed to the
tiveness of the routing plan. When the fleet of t
is large, this is a particularly important matter.
concerns have reported that by careful routing
have been able to reduce the amount of equipme
quired, thus cutting down on total of drivers' w
and the other important items mentioned in the
going. In addition to this, many economies ca
gained by routing the trucks over the best possible
as well as over shortest distances, saving both tim
wear-and-tear on the vehicles. Fleet owners wou
well to consider the advisability of employing a
patcher to be solely responsible for the routing
scheduling of trucks.

The waste that is so often found in idle equip
time may, in many cases, be the result of installin
many vehicles. Of course, one of the principal

truck operation is that of maintaining an ade- umber of vehicles to meet rush season require- nd yet have as few trucks as possible idle when nents are low. Various methods are available operator for accomplishing this, and these will ussed more fully in a future article. It is men- here as a fundamental of importance, to be con- in an analysis for reducing costs.

thermore, the unsatisfactory experience of many s with motor trucks has frequently been due to t that they have been put to tasks for which e not actually as well adapted as are horse-drawn s. When routes are short, the idle standing time equipment during loading and unloading periods nakes the horse-drawn unit more economical, as ed charges of motor equipment are so much The reason for this very common mistake is that erator will compare only the running charges notor truck with the cost of the horse and wagon. a procedure it is very easy to show an advantage trucks. Yet if all costs are included in each case, nparison is often apt to favor the horse on the oute.

pointed out in a recent article the keeping of ac- complete costs and an intelligent application e figures will do much to reduce the cost of de- Most concerns, it has been found, recognize the of cost records, and the large majority make pro- for keeping them. An important point, however, not all of these systems are so nearly complete as a true indication of the many steps that can be to lower costs. By keeping separate records of ruck's repair costs it will be possible to detect ble drivers and inferior vehicles, both of which much to mount the operating cost. Similar econ- can be gained by a study of the cost sheets with t to such items as mileage on routes, gasoline nption, idle time, etc.

seventh and eighth points brought out in the on in the beginning of this article, having to do the upkeep of the trucks, are entirely self-ex- ory. They are both worthy of careful thought, estigation has shown that they are essential which often neglected and, at the same time, ones which n important bearing on the unit cost. Mainten- plans and operating suggestions have been dis- in previous articles. It is especially important rovision be made for taking care of minor repairs n as they develop, as this will save many large bills and much lost time of the vehicles while s are being made.

Ideas for Improvement.

us now review the results of a close observation slightly different point of view. Let us consider ds of operation or other practical ideas that have found to offer advantages in actual use. By a l consideration of each of these, it will be a simple for the reader to determine the advisability of ng them to his own use.

ry important advantages, for example, have been to lie in standardizing as far as possible on the used. Once having determined the make of which proves to be the best investment, the prac- f standardizing on this make is extremely ad-

chanics become accustomed to working on the one and adjustments and repairs are made more y and more economically.

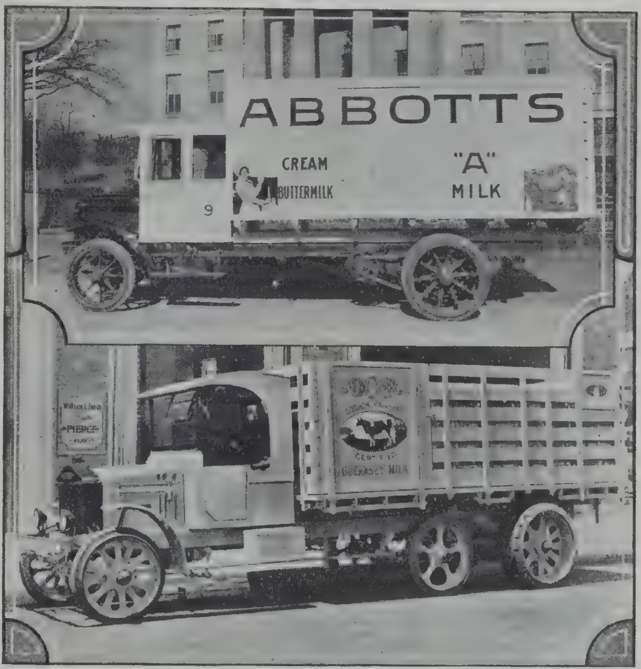
rts may be kept on hand for immediate use, thus ng the necessity of keeping the truck idle until arts can be obtained.

Many operators go even further than this by keeping complete units on hand so that, for example, a motor needing repair can be taken out of the car overnight and a substitute motor put in, thus reducing the vehicle's idle time to the very minimum.

There is also a further advantage to be gained by standardizing the loading facilities and the motor trucks to the best advantage in relation to each other.

When the fleet of trucks is large enough to justify the capital investment, it has been found that a large measure of economy in running expenses can be gained by establishing a repair shop exclusively for the owner's own fleet.

The advantages of this apply in various ways. There are some operators who do not believe in doing anything until something happens to the truck, saying "Let it run until it needs repair, and then do all the work at once." These operators are usually the ones who do not maintain repair shops, and quite naturally they do not feel that it is necessary to take the truck time and to pay the cost of regular inspections by an outside mechanic. They neglect to consider that, while the cumulative effect of troubles in their early stages seems important, the time and cost of lengthy overhauls that will invariably result are considerably greater.



Select each truck to best fit its jobs. Below a heavy-duty open model for short distance bulk hauling. At the top, a refrigerator body for long-distance work.

Every truck operator should see to it that no truck is allowed to run for more than 24 hours with a loose part, a part likely to break, a part needing adjustment or replacement. This means that a daily inspection should be made or the driver consulted as to any irregularities of running. In this way any trouble is caught immediately and before there is time for it to develop into something more serious.

Inspection on the garage floor with the engine idling is not enough; that is why the driver should be consulted. A knock may have developed in the engine, in a universal joint, or in the rear axle or countershaft. No doubt the knock would not cause interference with truck operation the next day, but, if it is not investigated and stopped, that knock may mean the breakage of a gear, a connecting rod, or what not.

Dependence on a public garage or a service station is satisfactory only in one respect. It is a place where work may be done. But these stations and garages are not able to fix up a truck and get it back to the owner in quick time. This brings out the importance of providing a repair shop equipped with adequate tools and placing it in the charge of a reliable mechanic.

Tire Replacement Important.

A policy of truck maintenance that has a most important bearing on operating costs where vehicles are equipped with solid tires is that of replacing these tires with new ones when they have been worn to a certain point. Just where or when this point is reached, however, depends entirely on the tire in question and on the treatment it receives at the hands of the driver.

The economy of replacement is due to the fact that much damage is caused to the entire truck when it is run upon tires with insufficient body or resiliency. Any operator who has ever run a motor truck for any length of time with thinly worn solid tires knows that such truck parts as the spring, axle centers, spindles, steering arm, axle shafts are seriously affected in this way. Unnecessary and very destructive strains are inflicted, which in turn tend to shorten the life of the entire truck, if the operator fails to replace his tires when their life is gone.

It is generally recommended that a truck which is operated on cobblestones or rough pavements should have its tires replaced when they have worn down the rubber to within one inch of the wheelbase. Under the best conditions of smooth surfaced roads, most authorities agree that a width of ¾-inch is the minimum required for proper cushioning.

The condition of the rubber, of course, has much to do with determining the point at which a solid tire should be replaced; for, if abused, a tire may be valueless from a standpoint of service, even though it may be two or three inches in thickness. It is a genuine temptation to keep the truck running on solid tires that are worn too thin to be useful, but it takes only one
such experience as a rule to convince an operato
it is merely "robbing Peter to pay Paul."

An idea that is increasing in popularity amo
larger operators of motor trucks is that of issuing
written bulletins at regular intervals to the truck
ers. These ordinarily take the form of concise s
tions or discussions on the more important points
eration.

Actual practice has proved that this can be c
out very effectively with considerable advantage
truck owner, providing the right attitude is as
in introducing or presenting the idea to the drive
is a most excellent method of suggesting poi
proper driving and care of the vehicle.

Many operators also use simple illustrations
decided effect. For instance, the important of
lubrication can be explained so that it will stick
driver's mind. By showing him a piece of po
steel, under a microscope, and pointing out tha
jagged outline—visible to the naked eye, must be
up with oil in order to prevent the edges from ca
damage, he is impressed more than being merely t
"oil up."

Educating the driver is largely up to the ope
for the average driver is eager and willing to lear

Saving Gasoline Cost.

The milk dealer will find that there is a worth-
incentive in the form of lower costs offered in enco
ing drivers to save in gasoline consumption.
concerns lay important stress upon this.

Among the items that enter into the cost of oper
a motor truck, that of gasoline has no small import

In fact, it may be said that of the total cost per
(including depreciation, interest, garage, insuranc
driver, as well as the more visible running costs
cost of gasoline averages about 24 per cent.

The cost of gasoline is a variable item, depe
upon the truck and the conditions under which
operated. Therefore, it is possible to effect subst
savings by rendering these conditions more favo

For instance, suppose a concern operates a fle
ten trucks, averaging 45 miles a day and each ge
an average of 4.5 miles on a gallon of gasoline.
each truck would use ten gallons of gasoline a da
the fleet uses 100 gallons. This at, say 30 cents a ga
costs $30 a day. Then suppose the average truck
age was increased to five miles a gallon, which is
one-half mile more; you would then save ten gal
or $3 a day, $18 a week, $75 a month—or $900 a
Quite a worth while sum, you will agree. The follo
are a few suggestions to help you in gaining the e
half mile or more.

1. Turn the engine off when the truck is stan
still.

2. See that the carburetor is adjusted to give
leanest mixture possible; and, above all, see that it
not leak.

3. Be sure the spark is properly timed and al
drive with the spark well advanced on the thrott

4. Remember that a truck going at a high s
uses more gasoline than one going 15 or 20 miles an h

5. Don't accelerate quickly, as this floods the
buretor and wastes gasoline.

6. On long grades, stop the engine and coast, o
least throttle down the motor.

VALUABLE INFORMATION OF INTEREST TO MILK DEALER.

Pennsylvania.

Dear Sir:—Your information in the March issue of The Milk Dealer greatly appreciated in regard to using gelatine in table cream. We are having considerable trouble and complaints with our table cream not being heavy enough. The state law of Pennsylvania requires an 18 per cent cream. We are running 26 per cent cream and still have trouble.

I would like to get more information about same. How much gelatine to use to the 100 quarts of 22 per cent cream to give us a good body. Any other information will be greatly appreciated.

Reply: It is against the law to use gelatine in cream in your state. In fact, the law reads to the effect that it is unlawful to sell cream "which contains or is mixed with any added condensed or evaporated milk or cream or cream to which has been added any substance for the purpose of increasing its consistency or thickness," etc.

For this reason we will have to attempt the preparation of a thick cream in some other way. I, therefore, suggest the following:

Pasteurize the fresh milk. Cool it immediately to 40 degrees F. and hold at this temperature for six to eight hours, but preferably over night. In the morning, warm to about 85 degrees F., mixing thoroughly, and then separate at this temperature. Cool the resulting cream to 40 degrees F., or lower, as quickly as possible, and then age it for twelve hours, or slightly longer. I believe you will find this results in the production of a cream of very high viscosity.

* * *

Texas.

Dear Sir:—I am still in Corpus Christi, working at the same old place, at the same old job, however for a new company. The Mistletoe Creameries bought this place out a year ago last month, and since that time we have made a real place out of it. We have practically doubled our business and at the same time we now have a little competition, however nothing serious.

In addition to writing this as a personal letter I am also writing for some information. The first question that I would like to ask is: Can hypochlorite be detected in milk? If so, how? Will hypochlorite, in small quantities, help preserve milk?

I am asking these questions because one of our small dairies in this city is selling raw milk and it won't ever sour, and I have made almost every test for preservatives that I know, and I have learned that he buys large quantities of B-K disinfectant which he presumably uses in disinfecting his utensils.

We used to be bothered a great deal with sour milk, but since the Mistletoe has put in equipment to handle milk, we have not had any more trouble; however we have not yet reached the stage of the game whereby we can put out milk which will not sour. (Nor do I think we ever will.)

Reply: There is a test for B-K and similar products, such as sodium or potassium hypochlorite, used as preservative in milk. The text is as follows:

To five c.c. of milk or cream add 1.5 c.c. of iodide solution made by dissolving seven grams of potassium iodide in 100 c.c. of distilled water. In the presence of a
small amount of hypochlorite the milk becomes
or brownish in color. If no color appears, add fo
of hypochloric acid, made by adding 100 c.c. of c
trated HCl to 200 c.c. of distilled water. Mix tho
ly. Place tubes in a water bath heated to 185 degr
for ten minutes; cool in cold water and then ad
half to one c.c. of the starch solution to the mater
lowing it to flow down below the curd. A blue t
plish red color appears when the starch solution is
The starch solution is made by boiling one gr
soluble starch in 100 c.c of distilled water and c

If you wish to secure more information on th
you may secure a bulletin No. 1114, U. S. Departm
Agriculture.

Now as to the merits of hypochlorite as a pre
tive. This material, as other similar products, is
did as a sterilizing agent, but it is not efficient as
servative of milk unless used in very large quan
which could be detected by the odor, the reason
that the presence of organic matter causes its de
tion. It would take a great deal of the product t
serve the milk for a very long time.

Oklahom

Dear Sir:—Can you tell me how to keep ba
count down in milk? We use a germ-killing sol
strain through cotton cloth and scald everything w
Wash the udders, run our milk over a cooler and
it in a cool place, and still have a high bacteria c
Can you explain it?

I would like to know what causes bacteria and
many different kinds there are. The plant where w
has 20,000 count after pasteurizing. Is that reason

Reply: There are four essential factors in the
duction of milk with a low bacteria count. You
undoubtedly familiar with these, as you mention
of them in your letter. They are clean cows and
barns, sterilized utensils, the small topped milk pai
cooling the milk to a temperature of 50 degrees F
lower. The small topped milk pail, which has an
ing usually five inches broad and seven inches long,
vents a great deal of dirt from dropping into the
thereby keeping down the bacteria count. Much o
dirt that falls into milk is soluble. It carries wi
millions of bacteria and, of course, these canno
strained out. It is essential to keep dirt out of
rather than try to eliminate it through straining.

The sterilization of utensils is especially impor
probably the most important factor in keeping the
teria count low. Scalding does not have very much e
unless the water is maintained at boiling and the
sils kept in it for at least five minutes. The best me
of sterilization is accomplished through steaming
steam from a boiler and our state law, by the way
quires that dairy utensils be sterilized with live stea
believe, however, you should get satisfactory resul
you boil the utensils for five minutes and then rins
you mention, with an antiseptic solution. The milk
should be treated in the same manner.

To help keep down the bacteria count when mill
it would be desirable for you to clip the long hairs

DEFIANCE, OHIO

the udder and flanks of the cows. This will enable you to clean the cows more thoroughly.

Now, as to bacteria. These are very tiny plants, so small that it would require about ten thousand of them to equal an inch in length. No one knows what causes them, as they have always existed so far as we know, and there are thousands of different kinds in the soil, some in water and many are found in the intestinal tract of the human being and animals. Some bacteria are harmless, others produce disease, such as diphtheria, typhoid fever, small pox, septic sore throat, etc.

Now, as to your last question. Twenty thousand bacteria is a reasonable count for pasteurized milk. I would consider this quite satisfactory.

Finally, I might state that if after trying the above suggestions to produce milk with a low bacteria count and you still find it to be high, the trouble undoubtedly lies in the udder of one of the cows. As a rule milk obtained and tested immediately should not show over one thousand bacteria per cubic centimeter. There are some cows, however, that secrete milk with a rather high count and this may be the cause of the high count mentioned in your letter.

* * *

Oklahoma.

Dear Sir:—I want to ask you to send me the per cent in food value of oleomargarine compared to cow butter. Here it costs 25 cents per pound while good cow butter costs 50 cents. I am in the Indian service and want to know the real food value of each so I can recommend the use accordingly.

Reply: I have your very interesting inquiry regarding the food value of oleomargarine and butter. I take pleasure in giving you the following data from some of the best authorities on dietetics. In an article appearing in The Milk Dealer for July, 1922, Profs. Steenbock and Hart of the University of Wisconsin quote as follows:

"Experiments have shown repeatedly that plant fats are totally free from vitamine A, and that most body fats of animals contain but small amounts of it, although there are some exceptions. Fats in internal organs such as the kidney and liver are very potent as sources of this vitamine and occasionally the beef fats, especially the highly colored yellow ones, are as rich as butter. As the fats of the internal organs are not used commercially and as beef fats make up only part of the final product, the result is that even the best of oleos are not to be compared with good butter. This criticism applies even more forcibly to the nut oleos which pride themselves on not being contaminated with animal fats. The nut oleos are the greatest menace to the dairy industry because of their cheapness and the low price possible in the sale of the product. Furthermore, by their manufacture, the use of animal fats is decreased and the livestock industry loses the benefits which the oleo manufacturers claim to have given it by the extension of their activities. This latter is, however, a questionable matter."

This certainly brings out the relative importance of the vitamine A content of nut oleo as compared with butter.

Again in Bulletin 291 from the Wisconsin Experiment Station (and I suggest you obtain this bulletin) these same workers make the following comparisons on page 15:

"In the dairymen's competition with butter substitutes a word should be said concerning oleomargarine. This product is made from both plant and animal oils and the higher grades are churned with milk or butter
or both. The plant oils used contribute no fat s
vitamines; the neutral oil, or that pressed from
contains no fat soluble vitamine. The oleo oil, o
prepared from beef fats, does contain some of this
of vitamines and of course the milk products cont
another portion. The result is that the finished
margarine contains some of this vitamine, but it is
sarily not in the same concentration as found i
natural butter. Their dilution, as compared with
terfat, is in proportion to the plant oils and neutr
used, with a further dilution by the use of oleo oil
contains this substance in less concentration than
butter. Consequently, even the higher grades of
margarine will have their fat soluble vitamine co
diluted, the degree of dilution depending upon
method of manufacture. Five per cent of butter
a ration of purified food materials contributes en
fat soluble vitamine for normal growth, but fiv
cent of the oleomargarine we have tested will n
complish this. These are the facts as they are k
today, and they should make it clear that no produc
claim the distinction of substitute unless it shows
nutritive value in quantitative relations. These fac
not condemn oleomargarine any more than they
demn plant oils, but merely disclose what each
tributes to nutrition."

I presume you are quite familiar with the vitan
those dietary essentials which are necessary for h
growth, reproduction and the prevention of ce
diseases. If these are not present in foods, human b
as well as animals will soon perish.

Again I quote from the annual report of the
tional Dairy Council of 1922:

"The general public is awakening to the fact
there is no substitute for butter. The truth abou
superiority of dairy products is being revealed.
have all heard about the demonstration conducte
butter vs. oleomargarine at Rochester, N. Y. Chi
were studied for 18 months. The first six months
had butter and other good foods; the next six m
oleomargarine instead of butter; then the third
months they had butter again. The first six month
butter, they gained an average of six pounds each
oleomargarine they not only failed to gain, but los
and a half pounds each; then, when back on butter,
gained eight pounds each."

* * *

Pennsylvani

Dear Sir:—I am giving you our way of han
our milk for heavy and table cream.

We separate our raw milk between 85 and 90 de
F., and have the separator set to skim a 40 per
cream. We standardize this 40 per cent cream to
our 26 per cent cream. Then the cream is pasteu
and cooled to 40 degrees F. We find by handling
cream in this manner gives us a thin cream and
times cream plug.

Would you suggest after separating the aged
to re-pasteurize the cream? I find if we do not
teurize the table cream to a temperature of 150 de
F. it shows a milk line at bottom of bottle. What w
you suggest doing to eliminate the milk line and
times cream plug?

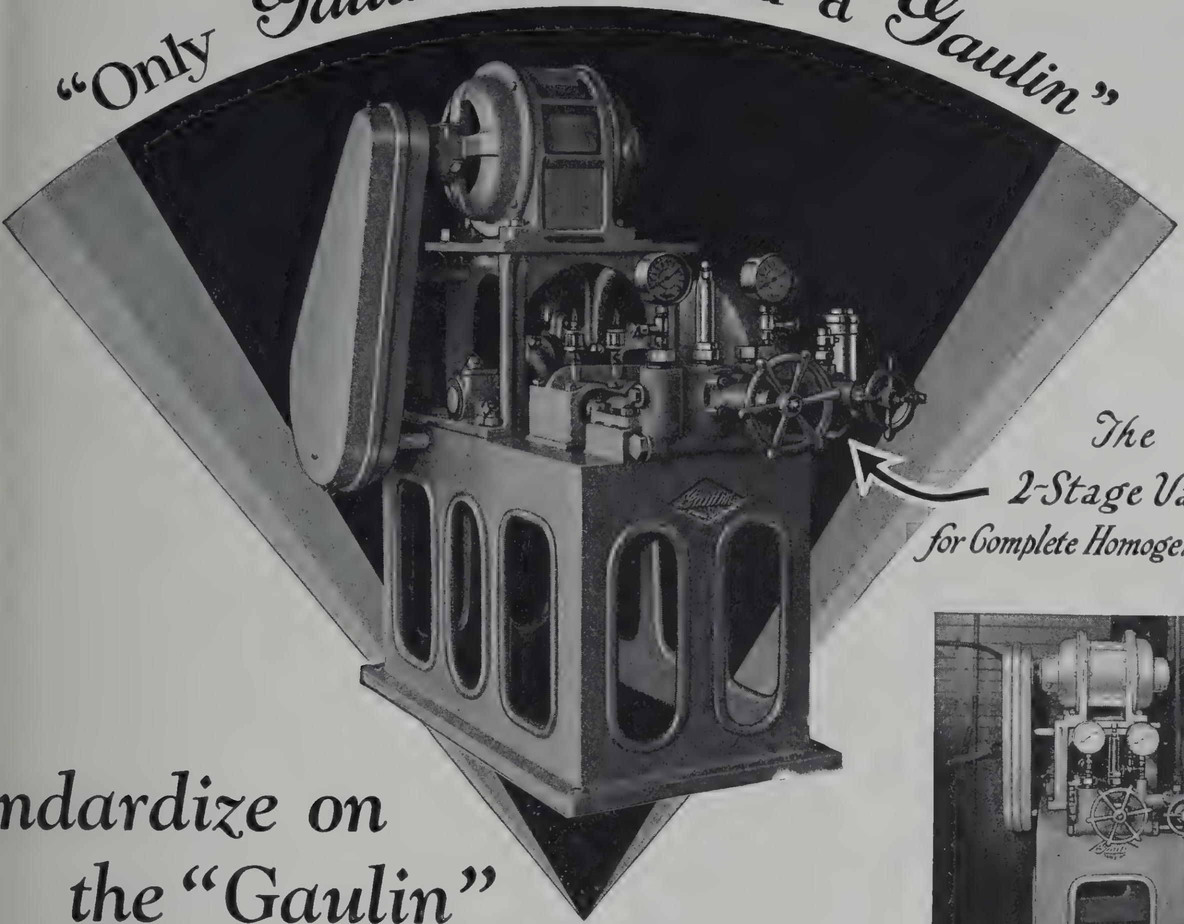
Many times we purchase 40 per cent cream, w
we repasteurize to make our table and whipping cr
which causes us considerable cream plug.

Reply: The chief causes of cream plug are:

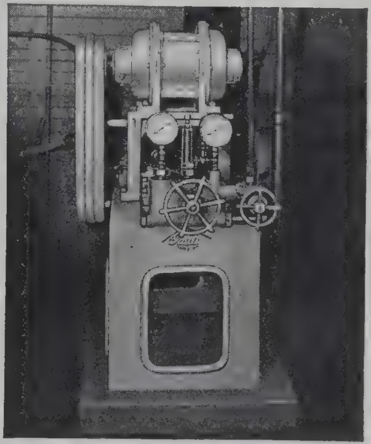
1. Evaporation of moisture from the surface of
   tled cream.
2. Partial breaking up of the fat globules in
   or cream.

Accordingly, you can see that many factors may

"Only *Gaulin* can build a *Gaulin*"



ndardize on the "Gaulin" ORIGINATOR *of the* Two-Stage Valve



Typical Gaulin Installation at Brayley's Creamery

THE 2-Stage Valve, *as originated and developed* by the Manton-Gaulin Manufacturing Company, has met with such favor because of its remarkable gain in efficiency over single valve operation, or other homogenizing devices, that it is today rapidly being adopted as *standard equipment* in the leading ice cream manufacturing plants in America and Europe.

The results obtained have been so enthusiastically received that the Gaulin Homogenizer equipped with the 2-Stage Valve has not only supplemented the homogenizing machinery in many plants, but we are constantly being called upon to equip machines of other makes with this efficient dual valve.

Reproduced above is a 250 gallon Gaulin homogenizer installed at Braley's Creamery, Somerville, Mass. After using machines of other make, this company finds that the Gaulin has given them *by far the best results.* Microscopic tests have shown that with the 2-Stage Valve they secure a much finer emulsion as well as a more uniform finished product.

More Gaulin Homogenizers are being manufactured and sold today than ever before in our history and we attribute this prosperity principally to our development of the 2-Stage Valve.

If you wish to secure *complete homogenization*—be assured of *positive viscosity control*—and guaranteed a *superior quality of finished product,* you will make the 2-Stage Valve, as *originated* by Gaulin, standard equipment in *your* plant.

A catalog describing the 2-Stage Valve in detail will be sent to you, free, upon request.

NTON-GAULIN MFG. CO. *Gaulin* TRADE MARK ***11 Elkins St.,*** **BOSTON, MASS.**

tribute such as:

1. Too vigorous or too little agitation during pasteurization.
2. Bottling before thorough cooling.
3. Pumping at the wrong temperature or too vigorously.
4. Slow cooling.
5. Heating too high during pasteurization.
6. Re-pasteurizing a second time.
7. Pasteurizing partly churned milk or cream.
8. Pasteurizing very rich cream especially at a high temperature.

I believe in your case to avoid a cream plug and obtain a heavy viscous cream, I would:

1. Pasteurize the raw milk when received.
2. Cool to 40 degrees F. and hold for six to eight hours.
3. Warm to 85 degrees F. and separate. (If a cream plug is noticed later on, then try separating at 100-110 degrees F.). Note: If you pump the milk to the separator a still higher temperature may be required. See April issue of The Milk Dealer.
4. Cool the cream to 40 degrees F. or lower. For table cream standardize at once with thinner, cold cream or cold milk.
5. Hold at 40 degrees F. or lower over night.

If you cannot handle it in this manner, I suggest you separate the milk at 100-110 degrees F. One hundred fifty degrees F. is not too high for pasteurizing table cream but I would not pasteurize the 40 per cent cream above 145 degrees F. Neither will you find double pasterization very desirable as it will result in a heated flavor and more difficulty from the cream plug.

The cream plug causes a great deal of trouble. For this reason many manufacturers are using a viscolizer, homogenizer or blender to eliminate it. If you have such a machine I would certainly use it.

* * *

Ohio.

Dear Sir:—About a week ago I was asked how much 35 per cent cream could be separated (centrifugal) from 10 gal. of 3.5 per cent milk. The rule using a hundred pounds of milk, as I understand it, is to divide the 3.5 test by 35, butterfat test of the cream required, and multiplying the result by 100, as 35 divided into 3.50 times 100 equals 10.00 pounds.

In using a smaller amount of milk than 100 pounds, as in the above case, 10 gallons or 86 pounds, should I have multiplied the quotion of the problem by 86 instead of 100, as 3.50 divided by 35 equals 10, times 86 equals 8.6 pounds?

Will you please give me the correct way to work this? Two other parties have worked it differently, getting different answers and, of course, they claim to be right and I feel somewhat uncertain.

Reply: I am very glad to give you the method of figuring the amount of cream that may be separated from milk of a certain richness. To work this, let us proceed in the following manner:

Problem: How much 35 per cent cream can be obtained from 10 gallons of 3.5 per cent milk?

Rule: Divide the pounds of fat in the total quantity of milk by the test of the cream and multiply the result by 100.

Example: Milk weighs 8.6 pounds per gallon.

Therefore 10 gallons equals (10 times 8.6 pounds) equals 86 pounds.

86 pounds of 3.5 per cent milk contains 86 times .035 equals 3.01 pounds of fat.

Assuming no loss in the skim milk, then 3.01 divided by 35 times 100 equals 8.6.

Proof: 86 pounds of 3.5 per cent milk conta times .035 equals 3.01 pounds fat.

Also 8.6 pounds of 3.5 per cent cream contai times .35 equals 3.01 pounds fat.

* * *

Massachuse

Dear Sir:—Do you think the board of health have any objection to adding a little rennet extr cream to thicken it? Those three suggestions you in The Milk Dealer recently certainly struck m right, as I am running our cream (heavy) 40 pe and light cream 17 per cent, which is often times in butterfat than the other fellow's, but their's a to be heavier, especially the light cream.

Will you kindly answer the following questi I am not asking too much?

Where can I purchase a book explaining how preservatives in milk or cream? I now have c Farrington & Woll which covers quite a few but wondering if you know of any that cover the whol ness as far as chemistry goes.

Can rennet be detected in cream; if so, can y plain a good method?

Will cream with a little rennet added stand well (in average summer weather) as straight c I have a notion it would develop a peculiar odor.

How can cocoanut oil be detected in milk or c

I thank you very much for answering my la quiry as it certainly helped me a whole lot.

Reply: I am glad to have your letter and lea suggestions have proven of some value.

You ask about the use of rennet in cream to t it. While I find nothing in my copy of the Massach ordinance that relates directly to it, I do find a under which I believe its use could be consider offense. Even though its use were permitted you not find it advisable to add it as the cream would very badly in hot coffee. If the cream happened slightly high in acid a more detrimental effect be noted.

You ask regarding a book giving tests for det preservatives in milk. Have you seen "Practical Tests," published by The Olsen Publishing Com It gives tests for the following: Formalin or for hyde, benzoic acid, salicylic acid, hydrogen pe carbonates and hypochlorites and chlorainins.

Rennet can be detected in cream but since it is only in small quantities a practical test would very reliable. The detection of small amounts re rather exact and careful technique and a well equ chemical laboratory. I have been using a modifi of the test for its detection in certain ice crea provers but in this case the enzyme is mixed and in the powder and occurs in rather large quantiti would not be applicable to milk and cream. Crea taining rennet in only the very small quantities th be used, will stand up quite well if kept cold. I believe you would notice any color.

Cocoanut oil is one of the hardest fats to det milk or cream. Its determination depends on ver cate chemical tests to determine certain constants butterfat as compared with the foreign fat. These ical tests are described in full in "Food Analysis Woodman, published by the McGraw-Hill Book pany, 370 Seventh Ave., New York City, N. Y.

Quality Milk Products

by using

M-C

MOLD-CIDE
Trade-Mark
Reg. U.S. Pat. Off.

SODIUM-HYPOCHLORITE

To combat your worst enemies Bacteria and Mold

Milk Plant operators agree that a chemical cleanser, sterilizer and deodorant is necessary to insure quality products, in addition to the use of live steam and hot water.

M-C is a chemical that meets all these requirements—that may be used at all degrees of temperatures—that kills the causes of spoilage and contamination at their source—that removes the invisible casein and bacteria from utensils and equipment—that penetrates cracks and crevices where other cleansers cannot go—that leaves no traceable odor itself in either the product or plant.

We have been supplying Food Product Plants for years with machines for the production of Mold-Cide. For plants not wishing to install a Mold-Cide machine now our Laboratory has perfected a highly concentrated and stabilized solution—40% stronger than similar commercial solutions now on the market. This concentrated solution may be purchased in one and five gallon bottles.

M-C is guaranteed to keep your Plant clean and sweet and improve the quality of your products.

Eight Years in One Plant

"We would not want to operate a food product plant without the use of Mold-Cide. We have been very successful in completely destroying mold and other bacteria so often discovered in plants where the air is nearly always damp."

B. S. Pearsall Butter Co.
Elgin, Ill.

Economical to Use

VALHALLA

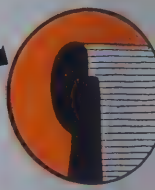
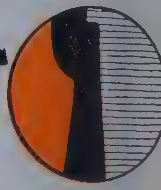
Why THATCHER Milk Bottles Last Longe



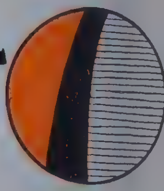
Extra Reinforced

THE UPPER EDGE or "roll" of every Thatcher Bottle is scientifically designed and extra reinforced to resist breakage, both at the capping machine and in every day use.



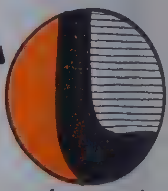
Perfect Cap Seat

DAILY TESTS and watchful care in manufacture assure every Thatcher Bottle an accurate cap-seat, designed to seat the cap perfectly and check breakage under capping machines.



Strong Shoulders

THE SHOULDER gets many bumps and knocks. The shoulders of every Thatcher Bottle are scientifically designed to resist these bumps and knocks. Uniform thickness of glass — no weak spots —insures more trips for Thatcher Bottles.



The Base Edge

THE BASE EDGE is another vulnerable spot. Thatcher Bottles are extra reinforced at the base edge to resist breakage. The rounded inner edge gives greater strength where most needed and makes cleaning and sterilizing easy.

The use of only the purest flint glass, perfectly tempered in scientifically designed lehrs, makes Thatcher Bottles stronger, tougher and more uniform in quality than any milk bottle on the market and explains why Thatcher Bottles give more trips per bottle. More trips per bottle mean greater profit to you.

The Thatcher Trade Mark is blown on the base edge of every Thatcher Bottle and is your guarantee of flawlessness. And Thatcher national advertising has helped many dairies build bigger profits. It will pay you to tie-up to it and to use Thatcher Bottles and Thatcher advertising material that is supplied FREE to Thatcher users. Mail coupon today.

Many users do not yet know the life of an Edison Battery!

THE life of an Edison Storage Battery is as far ahead of all other batteries of commercial importance as is the life of an electric truck chassis ahead of the gas truck. This long service shows itself in lower costs.

Here are the statements of a large eastern operator (name on request) whose trucks are now completely Edison equipped.

"We have some Edison Batteries in use today which have been in continuous service for twelve years and the average life of our batteries is nine years."

It is a common experience. Edison Battery long-life is a fact.

Electric trucks with Edison steel Batteries prove ideal for city and suburban delivery because the average speed is better, the service is cleaner, the life of the equipment and payload capacity are substantially greater and the maintenance costs are less.

Edison Batteries are made of steel and iron and nickel—different from all others of commercial importance on the market. The results are never in doubt. Let us show you some independent surveys of actual installations.

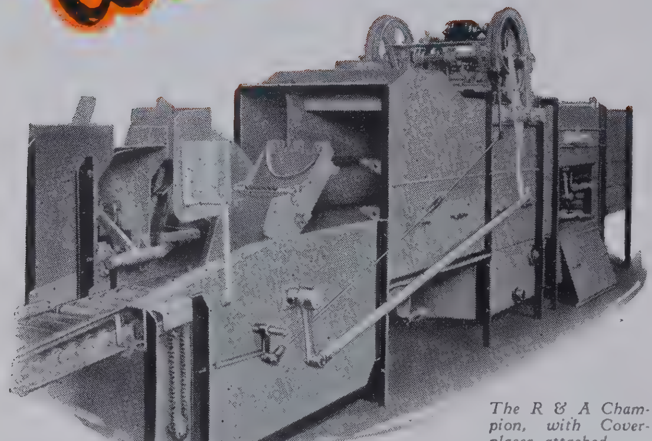
Whatever the size of your pla

there's an R&A wash



The R & A Champion, with Cover-placer attached.

R&A Champion CAN WASHER

In every advertisement we publish on the R & A Champion, we say that it absolutely has no equal among straightaway washers — in strength, efficiency, completeness and fair price. That statement is submitted to you in the spirit of a friendly challenge. Check this washer against any other you may wish on the four feature points, then judge for yourself whether we have over-estimated its good qualities.

It is built in three sizes—with capacities varying from 3 to 12 cans per minute. Cans and covers come forth clean, sterile and dry. Usually, the washer is purchased with the R & A Cover-placer which uprights the cans and re-covers them, with perfect ease and precision—but this is optional.

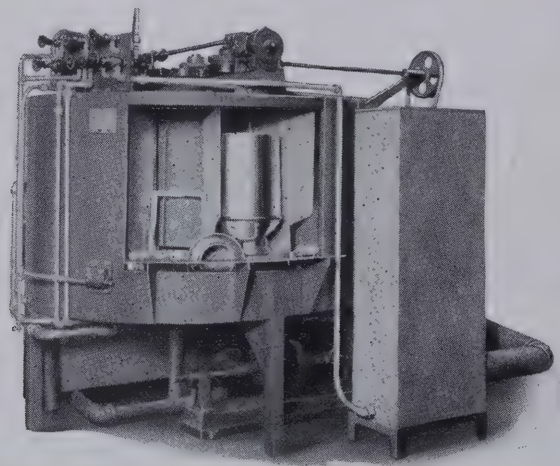
THE first thing any user of an R & A bot or can washer will tell you is that it d its work thoroughly; the second thi that it does its work tirelessly; the third thi that it does its work economically.

And, after all, aren't those the things you w most in the equipment you use: 1st, p formance—2nd, endurance—3rd, economy?

It's difficult, we admit, in these two pages, show you by word and picture how hones and efficiently these R & A machines serve; w gluttons they are for work—how indifferent abuse.

But, we shall try, in our brief descriptions make some of their good qualities very cl to you.

And if you will make the request, we will gladly send you complete literature on any or all of them; without obligating you in any way.



R&A Intermittent Rotary CAN WASHE

For years back R & A Rotary Can Washers have been giv excellent satisfaction in hundreds of dairies all over the co try. The R & A Rotaries of today embody the accumula experience of years. They are simple, strong and efficient.

Whether you choose the hand-operated model, or one of two power operated, you can depend upon it to produce cl sterile, dry cans. Its motor, pumps and fan are high-powe and trouble-proof. Jets are operated and drum is rotated the Geneva Intermittent Drive, the simplest and most depe able of all drives for rotary machines.

Three models: 1 hand operated; 2 power operated; with cap ities from 2 to 8 cans per minute.

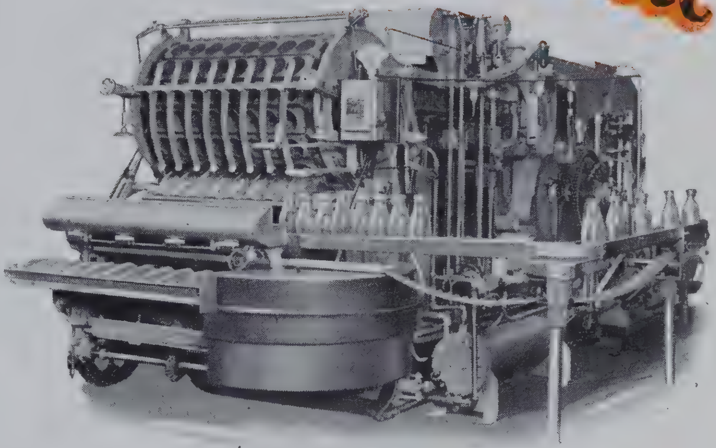
hatever the size of your pocketbook

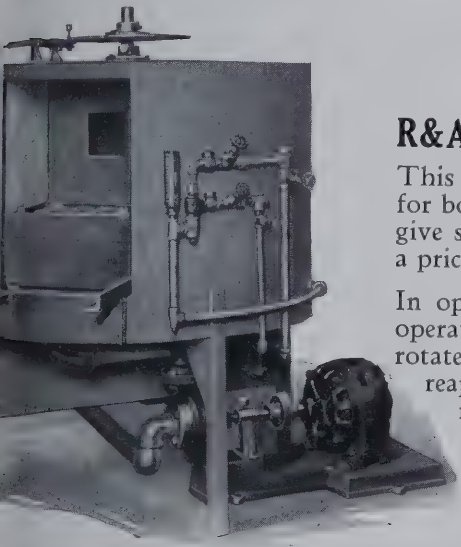
meet your needs!

A Three-way BOTTLE WASHER

ant bottle washer for big dairies. The standard el utilizes a highly efficient combination of soak- hydro and brushing methods of washing. It is available without the brushes if desired.

Three-way is built in all standard capacities— , 12 and 16 bottle widths. It is the first washer s type to be equipped with continuous automatic and automatic load and embodies numerous r features which equip it for long, hard service rger dairies.





R&A Combined BOTTLE & CAN WASHER

This washer, available as a bottle washer alone, or for both bottle and can washing, was developed to give small dairies a dependable, efficient washer at a price within their reach.

In operation, it is semi-automatic. All that the operator need do is to feed in the cases or cans, rotate the carrier, and unload them again as they reappear. With this washer, cases and cans do not have to be touched from the time they enter the machine until they are removed. Capacity — two cases or two cans per minute.

NOTE

All R & A Bottle Soakers are built under the basic patents of Charles E. Felt.

All R & A Bottle Washers can be equipped with hot-water sterilizers and coolers, if requested.

A Little Soaker-Hydro BOTTLE WASHERS

maller edition of the R & A Three-way in capacities ooth large and small dairies, embodying all that is best he soaking-hydro principle of washing. It does its k with an ease, thoroughness and economy that is ost startling to users of lesser machines. It is compact, to install, easy to operate, easy to care for. Every of metal—every mechanical unit in its construction e best that can be bought for the purpose. Three cities: 32, 48 and 64 bottles per minute.

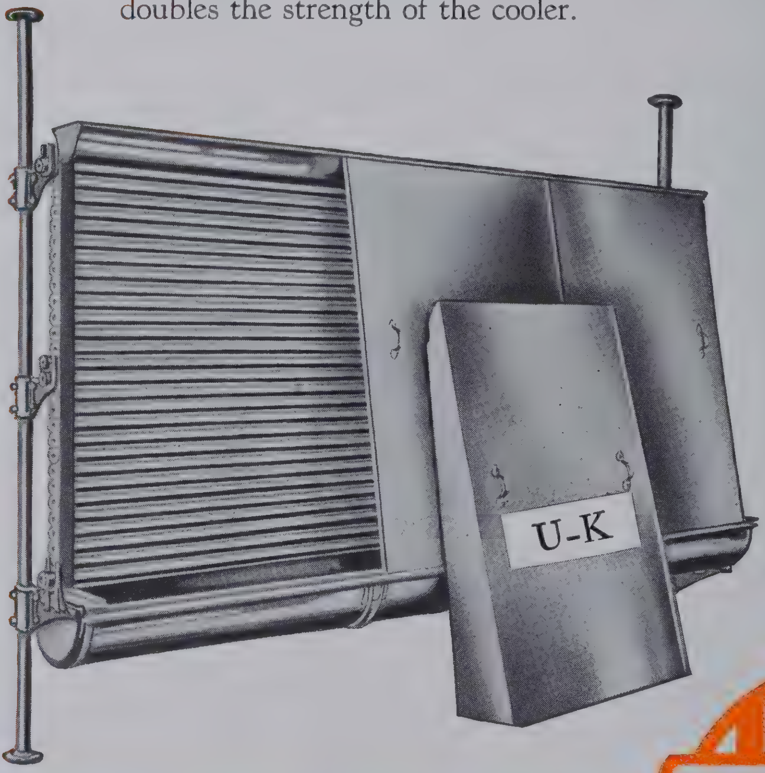
Milk Coolers

Lower Bacteria Count

U.K. COOLERS cool milk faster and have a more flexible capacity than any other cooler on the market. The rapid drop in temperature of the milk which the U.K. provides prevents further growth of bacteria which has survived the pasteurization process. The large manifolds or end-pieces allow a steady circulation of the cooling medium. This constant flow is absolutely necessary to get full benefit out of the brine or spring water used.

U. K. Cooler tubes are seamless, made of 18 gauge copper and heavily tinned inside and out. The method used in sweating the tubes to the end-pieces and the extra soldering doubles the strength of the cooler.



U. K. Coolers are made in a small size for farms, standard size for milk or ice cream plants, and a giant size for large dairies. Any size, any capacity, or any combination of sections can be built for your needs.

Keeping Posted on New Consumers

A Simple Method by Which the Milk Dealer Can Tell. No Milk Dealer Can Expect to Hold All His Customers But He Should Know Why He Loses Them

By E. J. CLARY*

THE expansion of any wholesale milk business or milk business catering likewise to the domestic retail trade, must depend in a great measure upon a careful study of sources for new milk outlets both as regards the domestic trade as well as the retail trade served. In addition, some method for an immediate follow-up when such information comes to hand is essential.

One of the most progressive milk dealers in the East recently had this to say: "The milk plant must expect a certain 'mortality' among its domestic and retail outlets each year and if progress is to be made in sales volume, enough new customers must be found and sold each year to offset these losses and to allow for a gain. In no other way can the milk business enjoy a healthy expansion........"

How can the milk plant set about to keep posted on new consumers in all groups and to line them up for trade?

Most of the milk dealers with whom the writer has contact recognize the importance of this job though very few of them have adequate "machinery" for accomplishing it as it should be done. Reliance is placed on mere chance and upon the eagle eye of the driver whose eye isn't always awake to new business on his route.

Something more dependable than mere chance is required to keep tabs on all the new milk outlets that are constantly popping up in our cities and towns. It is the purpose here to outline certain methods being utilized by progressive milk dealers in this work.

In the first place, where are the sources of new consumers? Most of them are found in every city and town. Once the channels for such information are opened up, the thing can be made a part of the office routine. Here they are:

Sources for Names of Consumers.

a—Retail licensing reports issued by the municipalities.
b—Reports of local retail trade associations.
c—Building permits, issued by the city or town.
d—Sales and leaseholds reported by realty boards and realtors.
e—Observations of drivers on route.

The above groups comprise:

1—Restaurant trade.
2—Hotel trade.
3—Domestic or consumer trade.
4—Retail outlet trades, groceries, food shops, etc.

Making contact with each source as outlined above, one person in the plant enters the names of new consumers on a card index, giving a duplicate in the form of a slip to the proper driver where it is merely a domestic account. Where it is a commercial account and of importance, a salesman is given the slip.

In each case, a report is required from the driver or the salesman. This must be made within 24 hours.

The cards are filed according to locality and then according to name, alphabetically. This prevents duplicated calls with their confusion and waste of time.

All tips that come from the above sources today are followed up the next morning. No time is lost.

If the driver on the route spots a new consumer, either in the form of a private home or a retail he makes an immediate report in detail that sam when he comes in.

This index serves more than one purpose; it b the nucleus of a first rate mailing list and also opportunities for follow-up until the business is se

The question naturally arises, can the house ge names without difficulty? Experience has prove the names of new hotel, store, restaurant or licensees are semi-public property and application license commissioner of your town or city will gi the freedom of the records. There usually is no though in some cities a typing or multigraphing is made; but this is only nominal.

The Trade Association Lists.

The chief value of local trade association lists the fact that they list changes of ownership withi membership body which in most cases offer a free for the house that refrains from pushing for its petitor's customer. The trade associations both away and sell this information. Their headqu usually are in the local phone book.

In addition to the general retail trade associ which takes in all merchants, there are in most associations comprising the individual trades whic offer more selective lists or bulletins.

In connection with the realty information, wh largely useful in locating new householders, for do consumer sales, this also is public property and th estate board in your city will, without doubt, giv access to their lists. In a city of 100,000 souls, the will find, as a rule, 2,500 retail outlets of direct in with a yearly increase (according to a late Washi report) of 10 per cent a year or 250 new outlets eve months. There will be, also, a mortality of some like 7 per cent which means there will be a net ga total outlets among retailers of 3 per cent or so,

The surest way to get the business of new ou domestic or commercial, is to get in on the ground Competition demands this—every one in the tra after new business and the early bird gets the wor

Ordinarily, the driver can be entrusted with fo up on domestic trade. He simply calls and asks fo business at the earlist possible moment. But wh comes to commercial tips, retailers, restaurants hotels, a salesman contact is worth while.

What is the best ammunition that can be use soliciting a new consumer?

What One Man Said.

In this connection, a leader in the Eastern trade "The best selling argument on new consumers in business is proof of satisfied customers served ov long period of time. * * Our men carry testimo which give them all the leverage they want. * *

Among the bigger operators in the trade, "new ness departments" have been established with the pose of doing just the very thing that the smaller op tor can do with as much success and profit.

But first of all it is vitally important to know the new consumer is, then, where he or she is. So

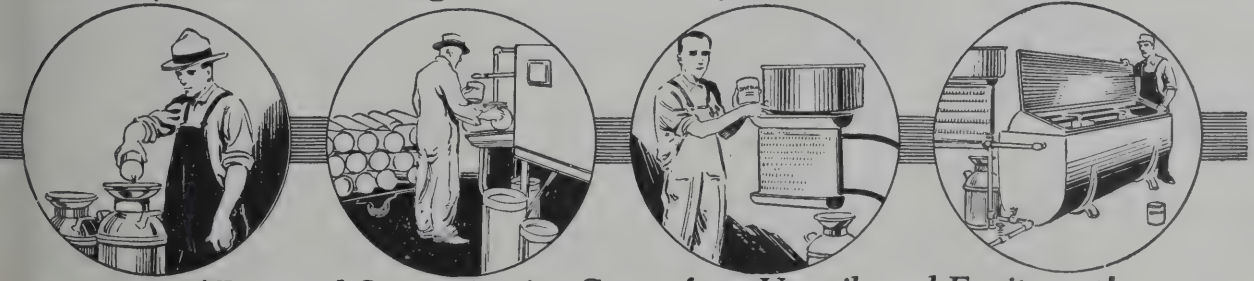
[2]—Destroys "ropy-milk" bacteria . . .
[3]—Prevents "off-flavors" . . . . . .
[4]—Overcomes "moulds" . . . . . .
with cold water

FARMERS, plants handling milk and milk products, everywhere, are *all* talking about this great new dairy discovery that now ends hot weather spoilage, sour-milk, and other milk bacteria troubles. You will be especially impressed with the *economy of* Diversol. One lb. makes 100 gallons of sterilizing solution. Keeps forever — never deteriorates. You make your own solution—quickly and easily, with cold water. You don't need steam or hot water—Diversol destroys bacteria with cold water that even steam misses. Non-poisonous. Never injures the hands.

Diversol is *more* than a washing compound, *more* than a sterilizer—it's both!—it destroys bacteria as it cleanses, and removes foul odors—instantly, with ONE warm or cold water wash or rinse. Think of the time and labor this saves you. Mail coupon above now for generous FREE quantity of Diversol and SEE what this great NEW dairy discovery will do for YOU! *You'll actually be amazed!*

Diversey Manufacturing Co., 53 West Jackson Blvd., Chicago, Ill.



85% of Bacterial Contamination Comes from Utensils and Equipment!

DIVERSOL ends all that trouble!

the constant tapping of sources becomes the most necessary part of the operation. Next, it is important to record all new prospects in a way that they will not be duplicated on the records.

One way is, check the batch of names from each source for a given period against those from each other source and thus prepare a single list which is then transferred to the card index.

Provision can be made on these cards for the first, second, third and fourth reports of contact people on each tip passed out for follow up.

It is particularly profitable to maintain this sy
connection with new retail outlets.

One Eastern dealer told the writer that 20 p
of his business increase in 1926 was strictly n
tomer business—owing to an aggressive and well
system of checking and following up.

Another claims that it is profitable to tra
domestic consumers through realty boards and
them up, their business in the long run more th
ing for the time and money spent in the job.

Putting Pep Into Your Drivers

A Promotion Week Every Month Builds Your Business and Good Will. Keeping Out of a Rut is Good Business

By FRANK H. WILLIAMS

WHEN dairies and drivers run along at the same consistent level of efforts all the time they naturally get a worth while volume of business. But when an extra special effort is made every now and then, business shows a decided spurt in most cases.

It is evident, then, that it is a valuable proposition for the dairy to every now and then do something extra in the effort to get business. And a particular effective method of putting on such an extra spurt consists in staging a promotion week every month during which all of the people connected with the concern redouble their efforts on their jobs and do everything they can to secure more business.

A good time to stage such a special promotion week is during the last week of the month. In fact, if the last week of each month is designated as a special promotion week over a period of time the results from this event will generally be found to be very satisfactory indeed.

During this special promotion week the dairy, of course, puts on a special advertising campaign in the daily newspapers and, perhaps, uses the mails, too, in the effort to get its message before the public. The trucks driven by the routemen are also specially decorated with banners for the week, perhaps, and all of the employees in the dairy can be specially "dolled up" with badges or something of that sort so as to make a particularly good impression on the visitors the dairy should try to get into its establishment during the week.

Special promotion stunts of various other kinds can be arranged for the week, too. Such, for instance, as staging special meetings of all the employees, offering prizes to the drivers who show the biggest percentages of increase during the week, offering prizes to the employees turning in the most worth while suggestions for doing things which will improve the business or operations of the concern. And so forth and so on.

All this sort of promotion work is, of course, as a sort of tie-up and help to the drivers on whom the main dependence for increasing business during the week must be placed. And, of course, the more the dairy can back up the efforts of its drivers by use of the promotion methods suggested and the more the dairy can pave the way for success when the drivers make their calls in the effort to secure more customers, the more successful the week will be.

It is evident, then, that if the dairy will provide the drivers with some sort of special cards or advertising matter for use during the week it will be of distinct help to the drivers. Such cards or advertising matter
should serve as a sort of introduction for the
when making their calls at new homes. On this
tising matter there should be information regard
week and information, of course, about the dai
about its products and prices.

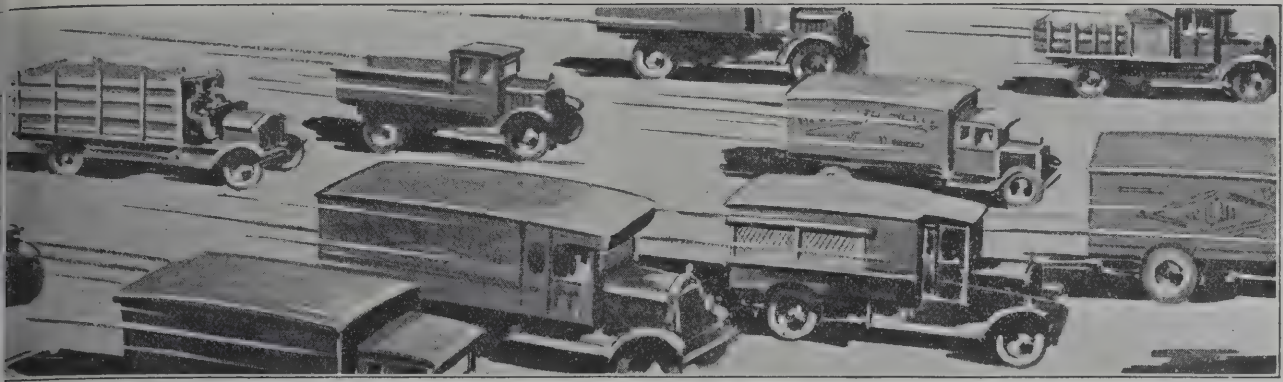
Then, armed with these cards, it is a compar
simple matter for the driver to introduce himse
new home in such way as this when he extends th
to the housewife:

"You've probably been reading something ab
in the newspapers. I represent the A. B. C. Dai
we are making a special drive for new custome
week. This card is a sort of introduction for me.
see, by this card, that we offer a splendid lot of pr
at prices which are extremely attractive. We
number of very good customers in this section
city. In fact, some of your neighbors have been
milk and cream from us for quite a long time.
we'd be glad to include you as one of our patrons

With this sort of an introduction the driver
be assured of a longer hearing than he might get
wise and, of course, the longer hearing the driver s
when calling on prospects, the more chance he
getting business from them.

During the week each driver should, of cours
to make double or three times the number of calls
dinarily makes during the course of a week, ar
the purpose of stimulating the drivers to make
calls, it is a mighty good thing for the dairy to
prize to the driver who makes the greatest num
bona fide calls during the week. For the purp
securing data on which to base the award of this
it is a good thing for the dairy to require each dri
turn in a completely filled out card for each call
—this card containing the name and address of th
scn on whom the call was made, the nature of the
view, whether or not the call was successful, and
mation as to what sort of a follow-up would be
able in trying to finally land the customer. In thi
the dairy would not only stimulate its drivers
would also secure a splendid amount of inform
which could be used to good advantage in circu
ing the prospects for business.

It is also a good thing for the dairy, during the
to stage a couple of special meetings for the driv
which there would be a distribution of cigars
drivers, thus making them feel more like attendi
meetings, and at which there would be snappy
of the kind most calculated to pep up the driver
make them step out and get more business. Many



Faster and Better!

You need quick-starting, fast-moving trucks today—trucks that make time through traffic and stay in service. That's why you find Federals in use by the biggest and best known firms in every city.

Every truck in the Federal line of Fours and Sixes is designed to meet the needs and conditions of today. Built in capacities from 1 to 7½ tons—with options in construction to suit every buyer and every business.

For 17 years, Federal has been foremost in providing the means of moving goods faster, better and at lower cost. See the sound values Federal offers — the many truck-saving features. Get the help of a specialist in the hauling problems of the milk business.

EDERAL

LL SIZES TRUCKS FOURS & SIXES

find that enthusiastic meetings of this sort are just about their best bets in inspiring drivers to do greater things and so such meetings are particularly appropriate and particularly successful at a time when the whole organization is keyed up to special efforts.

For the purpose of getting a continuity of interest into these promotion weeks it is a good plan for the dairy to offer some special prizes to be awarded at the end of a six months' period to the drivers who make the greatest increase in business during the six months and also to the driver who tops the list the most times in the number of calls made for the purpose of securing new customers.

By getting a continuity of interest into the promotion weeks in this way the drivers are made to see that the whole proposition wasn't a sporadic thing at all, but is a continuing proposition and they are also made to see that it is well worth their while to work hard on the affair so as to stand a good chance of winning the final prizes offered at the end of the period by the dairy.

With most dairies it will probably be found that the proposition of running these special weeks once a month for a period of six months is plenty long enough. In fact, some dairies might find that six months is too long a time to run the special promotion weeks and they might end the weeks after trying them out for four months. Then, at the end of the four months' or six months' period, it is a good plan for the dairy to lay off these special promotion weeks for a while at least. This is the case because no matter how good a promotion proposition may be it is bound to lose its punch when it is too long continued or when it is worked too strenuously. Then, after laying off the proposition for two or three months or even longer, the dairy could start in again with very excellent results.

Putting on these special promotion weeks in this way each month gives the dairy the chance for pepping up the whole organization into unusual activity. It gives the dairy the chance for getting out of the rut and injecting new spirit and enthusiasm into all of its employees. And that is the very thing which is most effective with many dairies in building more business.

Why not try this special promotion week plan in your plant?

SOME OF OUR TROUBLES.

Getting Out a Trade Magazine is no Picnic.

If we print jokes folks say we are silly.

If we don't, they say we are too serious.

If we publish original matter, they say we lack variety.

If we buy syndicated stuff, they say we should use items about our own people and our own plant.

If we stay in the office, we should be out rustling up news.

If we go out to rustle up a little news, we should stay in the office and not bother men at work.

If we don't print contributions, we are unappreciative.

If we print them all, the paper is filled with miscellaneous junk.

Like as not, some fellow will even say we swiped this from another paper.

And so we did!

⁂

FOUR OUT OF EVERY SEVEN DRUG S "FOUNTAINETTES" CALL FOR MILK DRIN

Four out of every seven people who order fo drink over the soda fountain counter at a Stat Randolph drug store in Chicago have a milk drin

This is the usual ratio, although some days more milk drinks are ordered, according to inforn secured during a National Dairy Council surve cently. In this one store alone, 125 gallons o teurized milk is used each day. That means 1,000 or 2,000 glasses of milk. The average number of served each day is 3,500, so that 2,000 out of every people ordering lunch or light afternoon refresh are milk drinkers.

Although malted milk sells for 20 cents and shakes for 15 cents, "malted" is ordered almost as much as milk shake. The favorite flavors of bo chocolate, strawberry in season, and pineapple. S berries are the only fresh fruit lending themsel use in milk drinks.

"The malted milk is the lazy man's meal," sa proprietor of the State Street soda fountain. " usually ordered with a sandwich during warm we A piece of pie accompanies the sandwich and the n during colder weather. The hotter the day, the the sandwich order falls off, but the malted still its popular place."

It is estimated that the amount of milk ordered is practically double that of two years ago for a soda fountains in Chicago. While the women children were the first milk patrons, the ratio of drinkers and women drinkers is about 50-50 now

The manager of the lunch service estimates tha gallons will be needed during the warm weather to care of the people ordering milk drinks. In rea weather this supply is only limited by the lack of co space, otherwise this one store could sell 300 gallo milk over the counter some days.

Acidophilus milk, the special culture-made bu milk, is becoming increasingly popular in drug s Five hundred bottles a month are sold at a single cago store, usually to steady patrons who are drin it for their health. That the trend of milk drinki soda counters has affected the soft drink busine evident on checking over any orders placed by m gers of soda fountains in various parts of the city is usually found, according to the dairy council su that the proportion of milk drinks over soft drink creases in the stores located in sections of the city w standards of living and general welfare are higher

WARSAW, POLAND, TO HAVE MUNICIPAL DA

The financial and budgetary committee of the saw, Poland, municipal council has approved a plan the construction of a municipal dairy in Warsaw, w capacity of about 350,000 liters (liter equals 1.1 qu of milk per day, to be operated by a joint stock com in which 51 per cent of the stock will be owned by city of Warsaw. This is the statement made by Assis Trade Commissioner L. J. Cochrane in a report to department of commerce. In the current year 1,50 zlotys (one zloty equals about 11.3 cents in U. S. rency) are to be expended for this purpose, and municipality will be authorized to contract a loan this amount, partially in long term bonds and part in short term drafts for the necessary equipment construction material.

so quickly cleaned —we do not have any trouble in removing casein deposits."

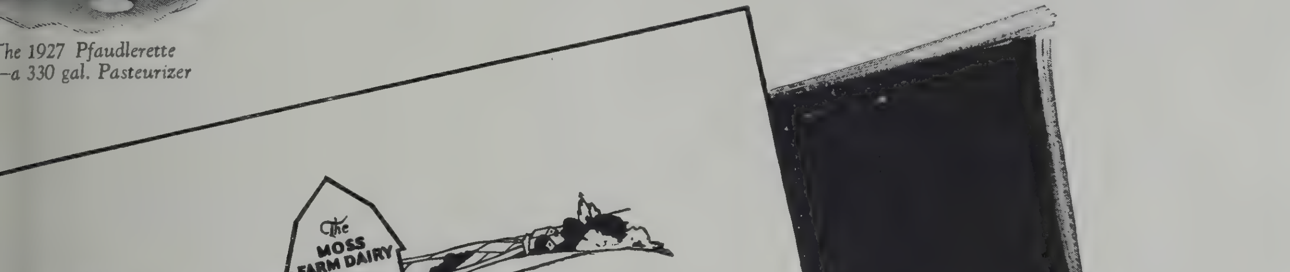
he 1927 Pfaudlerette
—a 330 gal. Pasteurizer



The MOSS FARM DAIRY
Chesterland Ohio

May 12, 1927

The Pfaudler Co.,
Rochester, N.Y.

Gentlemen:-

To reply to your letter of the 8th, is a real pleasure. A year ago this spring we purchased one of your "C-Gals" for making buttermilk. It gave us such satisfactory service that we bought a 300-gallon "Pfaudlerette" last fall for pasteurizing purposes.

At the present time we are using both of these units for pasteurizing. Under no circumstances would we go back to the coil vat. Pfaudler glass-lined equipment is so easily and quickly cleaned that we do not have any trouble in removing casein deposits.

Even in sterilizing skim milk for use in buttermilk and which means heating it to 190°, we have had no trouble in cleaning the equipment.

Yours very truly,
THE MOSS FARM DAIRY
W.O. Moss

Handling Customer Relationship

Is the Wagon Driver Qualified to Take on the Responsibility? What Else is Needed to Accomplish Proper Customer Contact?

By S. K. HARGIS*

TO THE milk plant customer, the driver is THE FIRM. He is the dealer. Whatever the driver may do, the customer considers that the milk plant management has done it and it is a very difficult matter to change this point of view. As the driver has most contact with the customer, it would seem that we have here a very vital problem in milk plant management and one that calls for every safeguard.

The experiences of leading milk dealers in this connection are both instructive and interesting. Perhaps a great many plants have overlooked and are overlooking this phase of management and have lost heavily as a result. The milk plant driver is perhaps no more and no less intelligent than drivers in other lines, yet, it is safe to say that in no line is customer relationship of greater importance than in the milk business.

While the milk salesman may create the customer, the driver is responsible for holding him and you can't sidestep this fact. If the milk dealer suffers a high "mortality" rate on his customer list, and if new customers merely fill the gaps, how is progress to be made, volume increased?

Undoubtedly, the average milk plant management feels it has done its best when drivers are selected with a reasonable amount of care and trained with a fair amount of trouble. But it is necessary to go a little further than that.

A large middlewestern milk dealer recently made the statement that the chief causes for injury in driver-customer relationship are:

(a) Tendency of drivers to alibi their own failures by "knocking" the plant management personnel.
(b) Failure of customers to explain grievances to the management.
(c) Utility by competition of isolated failures on the part of the plant.
(d) Inability of the average driver to rewin confidence when trouble arises.

Prevention Beats Cure.

It is true that the management of any well run plant stands ready to jump into the breach and save an account when it is threatened. But therein lies the trouble. The driver is inclined to protect himself and does so. I do not say that this tendency is universal in the trade but it is common enough to be serious.

Let me illustrate:

Herewith are actual remarks made by drivers to complaining customers as tabulated by one of the best known plant managers in the trade:

"It's none of my business—I'm here to deliver the stuff."

"You are not the only one kicking about our stuff. It's the guy down at the plant what does the routing."

"They give me ten times more than I can do with one truck—what do you expect? I'm going to jump this job if they load any more calls on me."

"I haven't got anything to do with it, Boss. You'll have to call up .... if you can find him in."

Now, the point is this. Only a percentage of drivers would deliberately adopt any such trade ruining as these. But it isn't any great matter to imagi effect of even a few drivers doing it.

Such drivers when discovered, are, of course, But that is only half the matter. A great many cou men on the trucks and wagons of the trade haven't the tact and experience necessary to m friend out of an angry or disgruntled patron. plant is compelled to send a salesman or an exe around to find out what's wrong and repair the tion, the cost becomes tolerable.

So, it would seem to be in the interest of good ness and progress to see that the driver is armed fair understanding of handling disgruntled patron that he recognizes the real importance of doing t properly.

It is a generally accepted principle in business —business that has a public relationship problem importance—that the very worst way to handle gruntled customer is to argue with him or her. Ye drivers out of ten will seek refuge in an argument only winds up with a wider breach.

How is an untrained driver to understan psychological side of this very vital matter—th customer has assumed a viewpoint and that all t gument in the world won't serve to change it?

Maybe These Will Help.

Instructions to drivers in connection with cus relationship come to me from a large plant in an line of business which would seem to apply very here:

To Drivers.

Next to getting new customers, it is vital th hold what we have. In no other way can this bu be built up to the advantage of everybody conn with it. You are on the "firing line." Disputes customers are sure to arise every now and then when you are there, you ARE the firm. Whateve do or say or fail to do or say will be charged up ag this business in the mind of the customer. You a effect, Mr. Blair himself when you are dealing w customer in our behalf. Therefore, we want you to and bear in mind how Mr. Blair handles kicks an gently request that you follow his formula as nea you can.

(a) Don't argue with a customer—ever.
(b) Take the stand that if we are wrong we wi right at once.
(c) Don't excuse failures to perform on the pl part. Excuses weaken your case.
(d) Promise rectification and then make them.
(e) If the customer gets excited, you will wi keeping your temper and being pleasant.
(f) Don't alibi your own failures on the jo knocking our plant or its management. If o here are wrong, we will alibi you at the p time and place.
(g) Only try and settle the simplest dispu where they appear serious, promise an imme

report to the office and we will call on your customer.

If the management of the plant can find some way to prevent the driver from disputing and arguing with the customer, it is on the road to success in solving customer relationship. Some drivers, perfectly loyal to the boss, operate under the mistaken notion that they should **defend** the business to the customer at a time when the latter has registered a kick on service or product.

Customer Has the Reins.

The customer is the judge. He or she can drop business relations with you at any time. Therefore, you must lose in any dispute. Where the kick is unfounded, it is the general belief of plant managers today that except in rare instances, the plant scores better by assuming the blame and making a settlement. The effect of a satisfactory settlement, even though entirely unfair to the plant, is excellent on the customer and will, nine times out of ten, win new respect and consideration.

Time was when public relations included a frame of mind that put the customer in the wrong when possible, that arbitrated on the basis of right and wrong. this policy won't hold water today.

I grant that in some lines of business there are lines drawn as to where the customer can be hun Losses would be too serious. But within the ever operations of the trade, it is fair to assume that th tomer always is right and act accordingly.

One plant manager said to me recently: "We found that our customers are the very strongest after they have made a kick and we have settled once and without argument or dispute of any kind have a special way of handling these matters. we sustain a loss through a false claim by the cust we charge it directly up to a good will account don't think that a dollar we spend on promotion is more profitably."

Will the driver restrain himself?

Will he keep his head and give the custome benefit of the doubt?

That is the big question. He will if he is train do it, but even then there is needed something more driver contact.

Prevention of Cottage Cheese Fermentatio

Tendency of Fermenting During Summer Months Can be Eliminated by Proper Methods

By H. W. VETTERLEIN

NEARLY everyone handling cottage cheese has had to throw some of it away on account of it souring or fermenting. Very often it is necessary to hold some of it over from Saturday until Monday, and in hot weather it is apt to spoil. I know of one concern that doesn't make any cottage cheese from June until October on account of this trouble. We have just found a method that will do away with this trouble to a great extent.

We now use a three hundred gallon cheese vat. Set the skim milk at 85 degrees F. about three o'clock in the afternoon, using twelve quarts of commercial buttermilk starter for three hundred gallons of skim milk. About nine o'clock the next morning it is firm so that it breaks cleanly, yet with no whey on top of the curd. We then cut into one-half inch cubes and heat slowly, stirring it gently so as not to break the cubes of curd. With very good skim milk it will be necessary to only heat it to 100 degrees F., but if the curd is gassy a higher temperature is necessary. We never use a thermometer while cooking because it is largely a matter of good judgment when to turn off the steam. If cooked too fast, or the curd is stirred too rapidly, the cheese will be dry and crumbly. If heated too much it will be hard and rubbery, so it naturally takes some practice to make a uniform cheese day after day. When cooked enough we drain off the whey with a common cheese strainer inserted into the inside of the faucet and inverting the vat when nearly drained and leave the curd in the vat. Then cover the curd with 70 degree water and add one and one-half pounds bicarbonate of soda and wash thoroughly. Drain again and cover curd with cold water. Wash the curd again. Drain off all of the water.

We take a common sprinkling can, put one gallon of real hot water into it and dissolve into this one-half pound of a cream acidity standardizer, and sprinkle the curd, thoroughly mixing it right away. I belie is the best plan to put it on cold. Mix the powder hot water the day before it is to be used and tra to a glass bottle. From three hundred gallons of milk we get about three hundred and sixty pounc cheese. For this amount we use three pounds of cl salt evenly mixed through the cheese. Then transf clean ten-gallon milk cans and ice it up in the co keeping the temperature about 38 degrees F. We a supply boxed up in three-quarter pounds paraf pasteboard boxes for the milk routes. Also sell the store either wholesale or retail. It makes a p able side line but cannot be used for baking, so we make a baker's cottage cheese.

We set the skim milk at 82 degrees F., using one-cunce cheese rennet and ten quarts starter for three dred gallons of skim milk, mixing thoroughly. We it in the afternoon and by morning it is ready to d We use muslin sacks a trifle smaller than flour sa We use a twelve quart pail and dip up whey and fill the sacks and pile them after tying securely draining rack. The drying or draining must be wat so that the curd doesn't get too dry. When dry eno we transfer to butter tubs, usually used ones, scrul and washed clean. Then we put the tubs in a co where we keep the temperature near freezing, and very good luck in keeping the cheese in good condi It is sold only for baking purposes and I think the re that it works out as it does is the fact that it is with rennet and is not cooked.

We have worked up a nice trade in cottage ch and try to hold it because if we didn't use up the milk it would go down the sewer at a loss.

The Sales Value of this Cottage Cheese Package cannot be overestimated.

It creates sales where other packages fail.

Tell us to place a set of samples on your desk.

Sizes one ounce to ten pounds.

What Self Insurance Is Not

Fallacy of Self Insurance has Been Proven in Many Cases. Milk Plants Cannot Afford to be "Self Insured"*

INSURANCE, to be insurance at all, must involve a transfer of risk. Just as there can be no play of "Hamlet" without the Melancholy Dane stalking through it, so there can be no insurance of any kind where responsibility for loss does not pass to another.

This was true when the first policy was written, centuries ago, when English ships and their cargoes were "underwritten" by associated individuals who, for a consideration, each assumed part of the risk of loss by fire or storm. And it will be equally true when the last policy is written. Risk transference, while not all there is to insurance, does remain its one basic law.

For insurance there is, of course, no substitute—although a few short-visioned persons now and then have thought otherwise. But there is a scheme called Self-Insurance. The very word is plainly a misnomer when used in this connection, since it does not involve this essential transfer of risk. It is, in fact, merely a privately accumulated fund to cover fire losses; that, and only that. Such a fund is no more fire insurance than money in the bank is life insurance.

Self-Insurance is not popular in America. American business men as a class know that sound, regular insurance is indispensable to them and to their operations. They owe too much of their past and present prosperity to its beneficent protection ever to entertain, except in isolated instances, any fleeting thoughts of ca their own loss liability. They have witnessed th experience of most of the few who have tried to They have watched—and they have learned.

A SELF-INSURED FIRE.

The Flame Fiend made a pretty complete "job" of the plant of Thomas A. Edison at West Orange, N. J., some years ago. Because of Mr. Edison's personal prestige and resources he survived a blow which to anybody else almost certainly would have meant the end—for not one penny of insurance was carried.

Nevertheless, every so often some business m manufacturer, perhaps—wishing to reduce his ove sits him down and pores over his ledger. Eventua comes to the item of fire insurance premiums. " gosh!" he ejaculates, "can't I do something this?" Reaching for the 'phone he calls up his ance agent. Agent hot-fo over. He h difficulty in ing that th is right. He the assured inspectio through his and points o hazards. He him moppin forehead vinced.

But thou is convinced mains rebe He must cut Transportati can't do wi He's got to his goods a can't very w into the ra business. .. "Eureka suddenly claims, and tling a fresh on his penc draws a firm through the Fire Insu "I'll go int fire insuranc iness. I'll my own risk

And so, without misgiving cancels his icies and sta self-insur fund. "Star just the w Usually it do get much b that point, f sees before what is fa him. If he do then some friend who k what's what who has this

ness man's best interests at heart, happens along. He corners him and sets him right. Says he:

"Now look here: In the first place, there is only one type of business which has even the faintest excuse for shouldering its own fire losses. This is the concern—a manufactory, perhaps—of normal hazard which has its own properties or units widely distributed throughout the country. For this reason the business is not likely to be seriously disrupted either by a single fire or by involvement in a conflagration. Yet even here there must be a pretty even distribution of values in these scattered plants; otherwise the experiment is likely to end fatally. For, suppose that the Blank Manufacturing Company operates three plants in as many cities. And suppose that these plants—we'll call them A, B, and C—have a sound valuation of $1,000,000, $200,000 and $100,000 respectively. Should a fire destroy plant A, the catastrophe would be virtually as staggering to the concern as if the three units had been merged in one, wouldn't it? Naturally!

THE EXPERIMENT THAT FAILED
Another view of the Edison plant ruins. The world rightly applauds Thomas A. Edison, who has done so much for the world. Yet, with many successful inventions to his credit, he failed signally in one experiment—the carrying of his own insurance.

"Hence, the mere segregation of units doesn't by any means imply safety nor does it give warrant for trying self-insurance. And remember—this type of business is, as I have said, the only one that could even attempt to bear its own losses with any justification.

"Even in these two cases, however, the justification is slight indeed. It requires time to accumulate an insurance fund. It can't be done over-night. If, at the moment you establish such a fund you drop all outside insurance there is great danger. Where is the guarantee that a disastrous fire will not occur at or shortly following the inauguration of the fund? There is no guarantee. And such a fire might wipe the fund out of existence in one fell blow. More, it might even lay such a drain upon the operating capital of the business as to embarrass it for years, provided it didn't put it out of running entirely and at once.

"On the other hand, if you retain outside insurance in decreasing amount while you build up your fund, why, the saving in premiums you make is bound to be relatively unimportant for a long period of years. Meanwhile you, as head of the business, sit in the office with your fingers crossed, hoping against hope that nothing
happens. Thus, before it is fairly begun, your s
defeats itself.

"Another thing to be considered is this: insu
proper is based on the law of averages. It wou
difficult to define what is meant by the law of av
except by saying that in order to obtain an avera
perience a large number of risks of a like kind m
considered for a period, the length of which deper
the number of risks written annually. Fire is
specter of risks. What is called a good risk may
less frequently than a poor one of the same clas
many of the best risks of every class burn. Obvi
therefore, any manufacturer who attempts to car
own insurance runs the chance of losing his best
erty or the property in which th
investment is found, and if he doe
such a property in the earlier p
his experience as a self-insurer, he
by creates an adverse experiment
the law of average from which it
and probably would take him
years to recover.

"Then there is the credit angle
considered. The self-insurer, at

The Consumer Should Pay Gladly

He Doesn't Want Cheap Milk or Cheap Service When He Understands the Problems Concerned with the Handling and Distribution of the Product

WE HAVE repeatedly urged readers of The Milk Dealer to take their customers into their confidence and tell these customers all about the service that the modern milk distributor is rendering. It is the way to prove to the customer that he is not paying too much for his bottled milk.

We are glad to give space to an article by Dr. J. J. Frey, chief of the bureau of dairy control, California Department of Agriculture, in which the doctor gives the consumers in his state some valuable information about the milk bottling industry. These facts are applicable to the industry everywhere. Why not give them publicity in your community? Here is what Dr. Frey says:

"The nutritional value of good milk and its prime importance in the diet of all persons, growing children in particular, is now generally recognized by all nutritionists and, through the influence of the public press and educational workers in schools, is coming to be appreciated more and more by our entire population.

"Also, the quality of milk distributed to 90 per cent of the population of the state of California under the provisions of the pure milk law and bearing the state grade label is so fine that it is accepted without a thought of the very perishable nature of the product and the very great attention to sanitary precautions and the details of procedure in handling by dairymen and milk distributors, and the ceaseless vigilance exercised by scientifically-equipped laboratories and supervisory agencies.

"Without this supervision, milk, which is the most fundamentals and essential of all foods, could become deadly. Fortunately, we have progressed so far in the matter of quality milk production that the consumer has only to look for the grade designation on the bottle cap and thereafter accept without reserve and with confident assurance that it may be given to his children or consumed in liberal quantities by himself without fear of any bad effects therefrom.

Public's Price Attitude.

"On the other hand, I for one have never been able to understand the attitude of the public toward the matter of price. It is difficult for me to see why the same people who will accept one-third as much value in some other community at three times as high a price without comment or objection, will howl to the high heavens when milk advances one cent a quart.

"We often hear comments that there is too much spread between the price paid for milk to the producer and that paid by the consumer. Such statements may be glibly passed off the tongue and as easily accepted, but to those who hold a sense of justice and a high regard for truth and accuracy, such loose consideration to a matter of so great importance causes some resentment. If consumers were willing and if it were feasible for them to take quart cups and hold them under the farmers' cows while they draw milk into them, they could doubtless get milk at seven cents a quart, and the farmers would be glad to sell it for such a price if enough people were willing to do this.

"But, instead of that, the consumers demand more service in connection with their milk supply than any other commodity which is used in the home. I be delivered promptly every day at their do regardless of Sundays or holidays, in a sanitary, package of convenient size.

"Just what does this involve in the matter pense? Ask yourself this question. Presume moment that you are the milk distributor and th are jumping around from house to house and b block over a considerable portion of the city, an give courteous attention to all of the little delays may arise in connection with these deliveries. tions must be answered, matters of complaint exp empty bottles collected, delays explained, ar thousand and one little incidents which thwar progress throughout the day attended to.

"Perhaps you would say that under these stances you could make 20 deliveries an hour, deliveries in 10 hours, which is more time than y willing to work at your office or in the shop.

"Considering that some of these deliveries one pint and others may be more than one quar haps a quart to a stop is a fair average. Agains 200 bottles of milk which you deliver are the ex of operating an automobile, the motor of whic run continually for these ten hours, burning ga and, with the continuous wear and tear on the m would require shop attention about once a week. must be another automobile in service to take its in order that the regular delivery of your mill not be subject to interference.

Must Have Day Off.

"The man who drives the delivery truck mus a day off occasionally and is subject to the same other people. There must, therefore, be a certain ber of extra routemen who are familiar with all routes in order to replace those who are enjoy day off or absent for good cause. New drivers be broken in from time to time and, in addition expense of making deliveries, there is the cost of and of putting the milk through the plant and p it in the bottles. In the United States milk bottles only 17 trips on an average, and they cost seven to cents apiece.

"When all of the expense connected with the going has been charged against 200 quarts, it w found that you have a total of some $15 a day co delivering. Your milk distributor, through expe and efficient operation, is able to do somewhat than the calculations above indicated. He will ac deliver more than 200 quarts a day, but in so do is earning the small margin of profit to which he titled for so great a service."

AMERICANS LOVE MILK.

Milk consumption in the United States inc nearly 2,000,000,000 pounds during 1926, and m the fluid was consumed as a beverage, according agricultural department, Washington, D. C. Every and child in the United States consumed approxim 1,000 pounds of whole milk during 1925. The tota sumption was 116,505,395,000 pounds.

INVITING as these pictures are for a personal visit to the executive offices and customers' reception rooms of the new Wanzer Plant in Chicago, you will find here other illustrations with an interesting story of this Model Dairy Plant.

Where Science and Equipment Me

New Plant of Sidney Wanzer & Sons in Chicago Meets All the Requirements of the Milk Man's "Dream Plant"

The Wanzers Hold Open House to Celebrate Opening of New Plant and the 70th Anniversary of the Founding of the Business

MOST milk men have a "dream plant." They hope for the time when they can build and equip a plant that will meet all the requirements that science and experience has taught them.

The Wanzers have made their dream come true. Their "dream plant" is functioning and they are justly proud of their accomplishment. Their new "Sunlight Milk Plant" in Chicago is what might be termed the last word in plant building and equipment. It was thrown open to the public during the week of June 20th, and thousands of visitors enjoyed its magnificence.

The site occupies a block of ground on the northeast corner of Garfield Boulevard and LaSalle Street, extending approximately 225 feet on Garfield Boulevard and 265 feet on LaSalle Street. The main dairy plant occupies the entire frontage on Garfield Boulevard, being set back twenty feet from the street line to provide for a grass plot with shrubs and flowers between the building line and the street sidewalk. It is approximately 215 feet in length along Garfield Boulevard, and ninety feet in depth with loading and unloading dockage across the entire rear. A fireproof barn provides for the wagons and horses. There is also space in the rear for a garage.

There being no truck or wagon entrance to the property from Garfield Boulevard, it has been possible to make this main frontage architecturally beautiful and this possibility has been well made use of by the architect, Mr. Hahn, through the attractive shape of the building and a unique arrangement of brick work and trimmings.

On the first floor toward the west is a large open
section approximately seventy-five feet square as

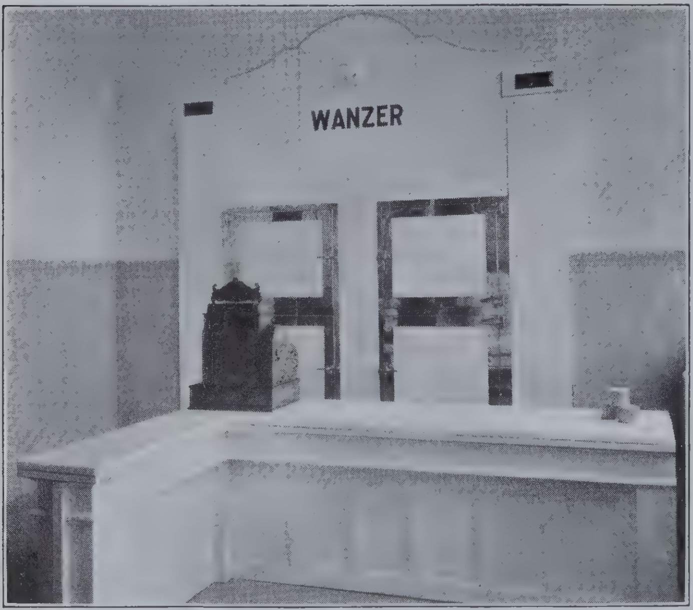
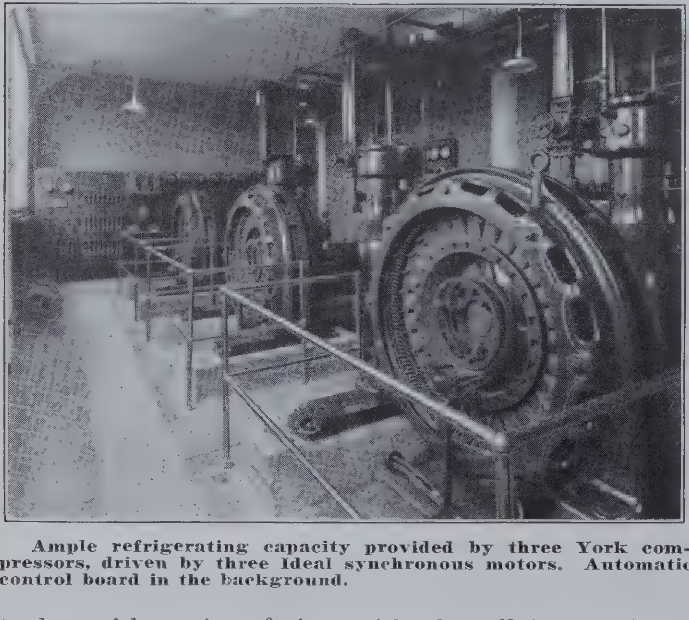
power boilers with automatic stoker feed and the best modern equipment for efficient service.

On the second floor is all provision for processing both whole milk and by-products while a mezzanine third floor holds the cream and buttermilk equipment. Directly below the third story level and toward the front, is the butter storage and butter cutting rooms.

All milk processing rooms have red tile floors and light tile wainscotes with all corners coved and particular attention paid to floor drainage. On the second floor level to the rear is an ice field of 25 tons capacity and an ample ice storage space in connection therewith. Ice is crushed at this level and delivered to the wagons at the dock below. In connection with the ice field are two large brine coolers which permit the use of the brine in the coolers, refrigerators, and ice freezing tanks, without interfering with the efficiency of the freezing plant.



Bright and inviting is the retail sales room to the right of the main entrance. Refrigerator is by McCray.



Ample refrigerating capacity provided by three York compressors, driven by three Ideal synchronous motors. Automatic control board in the background.

It has been the aim to arrange the operating spaces and equipment therein so that the entire process of preparing the milk and bottling it is in view of the public reception room on the second floor. For this purpose an elevated observation platform or logia has been provided from which point the entire line of milk appa from storage vat through to bottle fillers may be From the public entrance on Garfield Boulevar visitors enter a main hall from which the main sta leads to a well-furnished and appointed reception the observation logia, and a larger reception or le room on the second floor. These rooms are furn with distinction and comfort for the use of the p

The main reception hall on the second floor als nects directly with the general and executive which occupy the entire west end of the building second floor. The executive offices and a large c ence room comfortably equipped with a fireplace the boulevard. Provisions for washrooms, locker showers, etc., are very thorough throughout. One features of the design has been to eliminate expose unsightly piping as much as possible and yet so the work that these necessary pipes shall be acce in case of need for repair. Nearly all the main co in the building have risers cast in the center which care of floor drainage. Lateral pipe tunnels have provided of a size sufficient for repairs to be therein.

Three country plants, two in Wisconsin and Indiana, are sources of the milk supply. Glass tank cars bring the milk to the city where it is ferred to a tank truck and thence to the plant. T a temporary arrangement as a siding for the tank will soon be in operation.

Ice field with capacity of 25 tons daily. Pipe covering other insulation furnished by United Cork Companies.

At the plant the milk is transferred to the s floor by means of applying filtered air pressure to the milk through nickel pipe lines.

On the second floor there are located three large age vats, each lined throughout with pure nickel. the milk is cooled to 40 degrees by means of brin culating through stationery nickel coils. Pure tubing then carries the milk to the nickel milk capacity of which is 20,000 pounds per hour. A heater equipped with pure nickel tubes and havin same capacity, then heats it to 100 degrees Fahre The temperature in all processes is automatically trolled by means of thermostatically and electr operated valves, steam being employed to heat the

After leaving the heater, the milk passes th two nickel filters with a capacity of 10,000 pounc hour each. Three filter machines are installed and connected to enable the operator to disconnect an and insert new filter cloth without reducing the ca flow of 20,000 pounds per hour. Having passed th

Because of These Features

Complete separation of caustic soda in Soaker from fresh water in Washer.

No contamination of Washer and sterilizer by caustic from Soaker.

Thorough cleaning of bottles by caustic solution.

Positive sterilization in Washer.

Maximum soaking volume in proportion to soaking tank space.

No destruction of building by steam and no cloudy bottling rooms.

Tanks set clear above all floors, keeping plant sanitary.

All tanks closed on top, prevent loss of steam.

Handling quarts, pints and half-pints with only one simple adjustment.

Capacity may be subsequently increased by additional compartments added to Soaker.

Mechanical motion of Soaker is continuous.

Patent soaker buckets operating without friction or breakage.

Soaker compartments completely divided making each compartment an independent soaker.

Mechanical Washer movement is intermittent.

Double main drives and no high speed operating parts.

Nine automatic safety devices insure continuous operation 365 days per year.

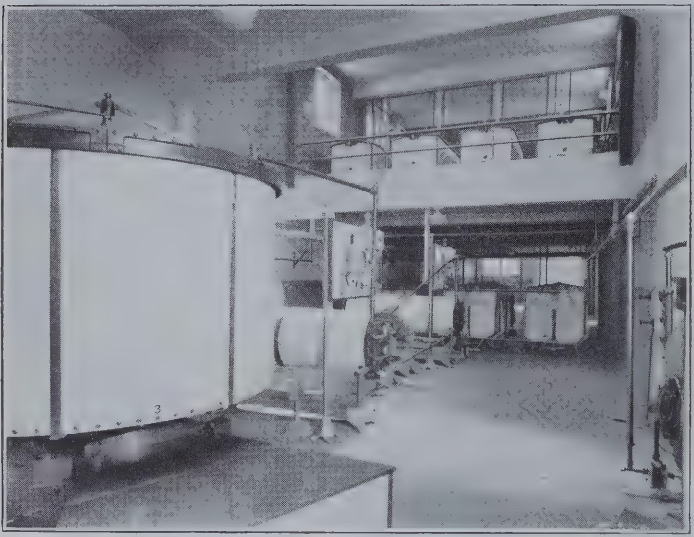
Eight complete GIANT units adopted and in operation at the Sheffield Farms Co., New York City.

Two complete GIANT units in operation by United Dairies, London.

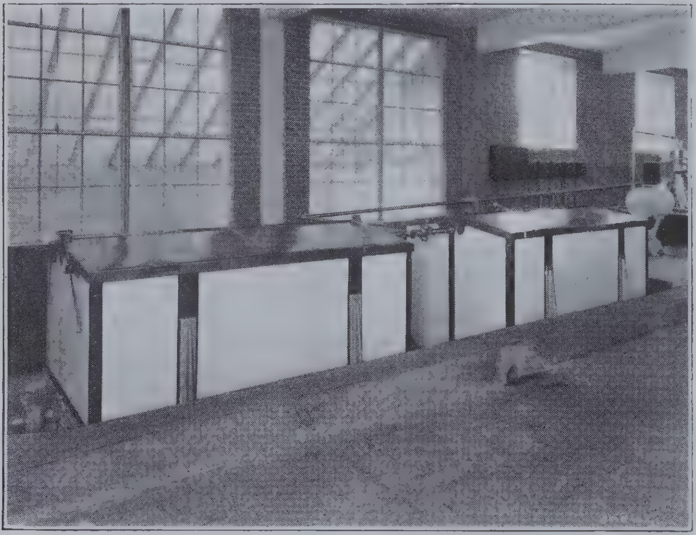
Backed up by 25 years continuous experience in building bottle soaking machines.

ACHINERY CO., St. Louis,
U. S. A.

the filter, the milk enters the final barrel heater of same construction as pre-heater, where it is brought up to a temperature of 145 degrees Fahrenheit. Leaving this heater, the milk passes through a sanitary flow meter which records the pounds of milk passing through the entire system per hour. A positive automatic holder, pure nickel lined, then retains the milk at an even temperature for a period of 30 minutes, and automatically discharges it over pure nickel surface coolers, from whence it flows by gravity to the four nickel bottle fillers and cappers on the first floor. This holder is the largest one ever built, we are told. Automatic nickel conveyors move the bottled milk outside of the filling room where it is placed in crates and further conveyed to the cold storage room, the temperature of which is kept at 35 degrees.



Pasteurizing and holding room. Mortensen buttermilk machines shown on balcony. Mortensen holder on extreme left, and part of cream holding unit on extreme right. Three VonGunten filters are on the milk line between the two Chester barrel heaters. Heating and holding under automatic control. Complete view of this department may be had from observation platform. Entire plant is finished with Barreled Sunlight.



Cream pasteurizers and holders. Chester barrel heater and De Laval separator on the right, and to the right of that are the four Mortensen buttermilk machines. To the left of the cream vats are the Cherry churn and Stoelting vat for cottage cheese making.

Sweet cream is stored on the third floor in a battery of nickel-lined storage vats where it is cooled in the same manner as milk. From here it passes by gravity through pure nickel pipes to a pump with a capacity of 6,000 pounds per hour. The pump pushes the cream through a nine thousand pound per hour barrel
with pure nickel tubes. Here the cream is heate
trolled, and recorded in the same manner as mil
thereafter passes to a nickel lined holder of 6,000
capacity, which retains the cream for 30 minutes
even temperature, and then automatically discha
over the coolers. From the coolers it passes by
to the fillers where it is disposed of in the same
as milk.

Buttermilk is made on the third floor of the
four buttermilk machines, also nickel lined. Fron
machines it is passed directly through nickel p
the fillers by gravity and is then conveyed to the
room.

Sixteen tons of nickel enter into the construc
the equipment. Some one has calculated that
equivalent to 32 tons of five cent pieces. The milk
in the plant comes in contact with nothing bu
nickel and glass.

A double cross connection in the pipe lines m
impossible for the plant to be "stalled." A 2

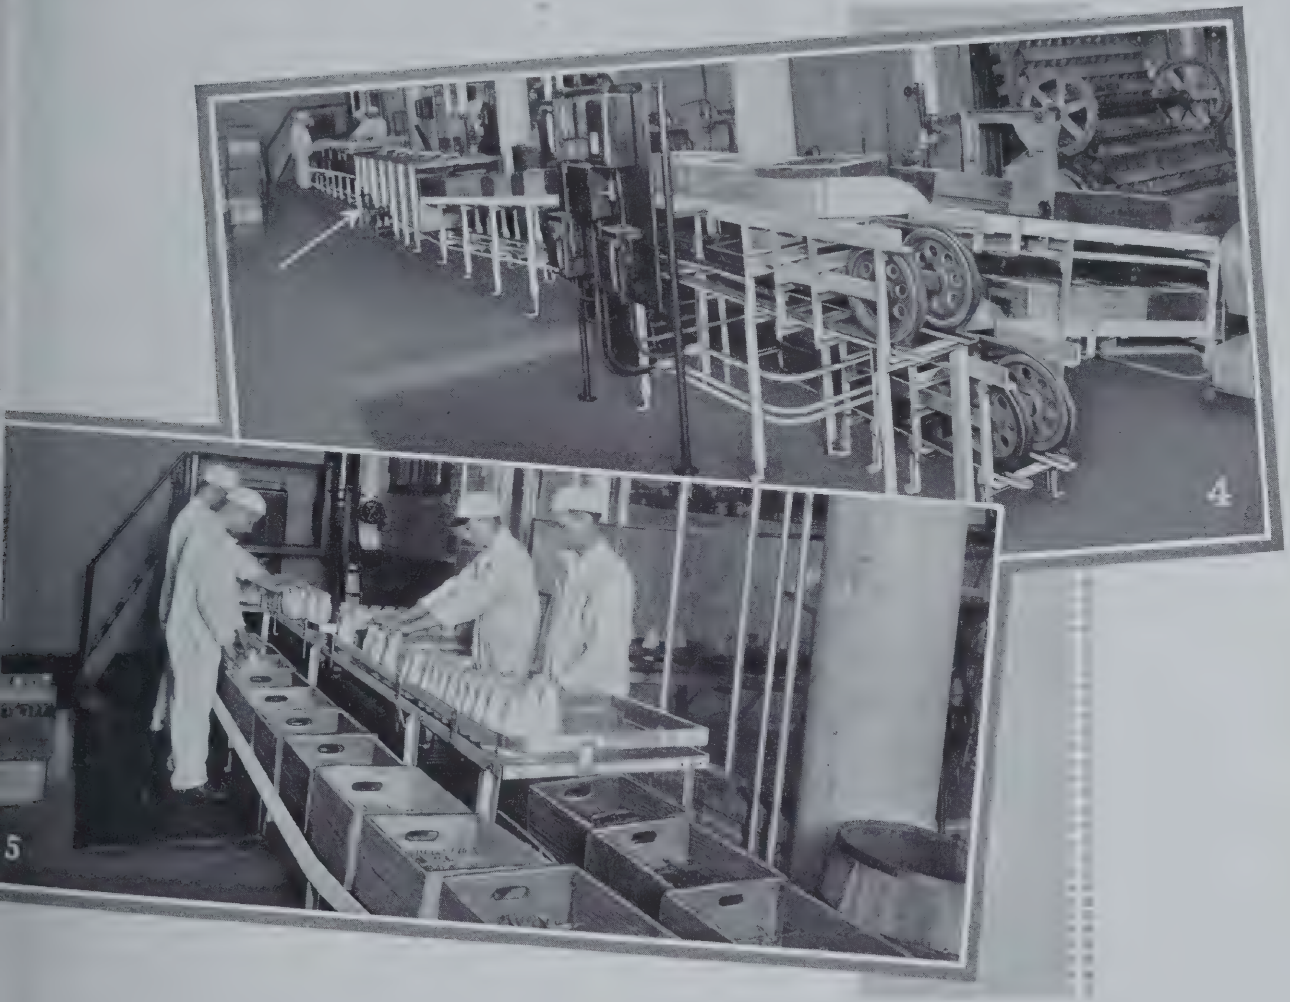
the New Wanzer Dairy, Chicago



1 Automatic Conveyors on loading platform convey crates of bottled milk to wagons, and crates of empties from wagons to bottle washers.

2 Double track system of conveyors from wagon platform to bottle washers, and to storage.

3 Conveyors bring crates of empty bottles automatically to hand of each operator. Operator does not have to touch crates. Slight pressure on foot pedal releases emptied crates.

4 Double track conveyor takes empty crates through enclosed 15 foot crate washer (indicated by arrow) where crates are thoroughly cleansed, cooled and then conveyed to filled bottle accumulating table.

5 Cleansed crates are conveyed automatically to accumulating tables. After being filled crates are released by foot pedal, and automatically pass through self-closing door into cold storage rooms.

There are 509 feet of Mojonnier Automatic onveyors in the fine new Wanzer plant; 140 eet on loading platform alone. (See illustration o. 1).

The conveyors are of sturdy and durable hain type used for several years in ice cream lant work and so designed that the conveyors eed not be stopped during operating hours. As he crates are stopped from time to time the hain harmlessly slides under the crates. When released the crates are carried positively forward.

The conveyors are low down, 20 inches from floor, heavily galvanized to resist rust, and each length of chain is lubricated underneath at one point.

Let us work with you on your conveyor problems. Just drop us a line and our sales representative will call on you on his next trip in your vicinity. Write for further information.

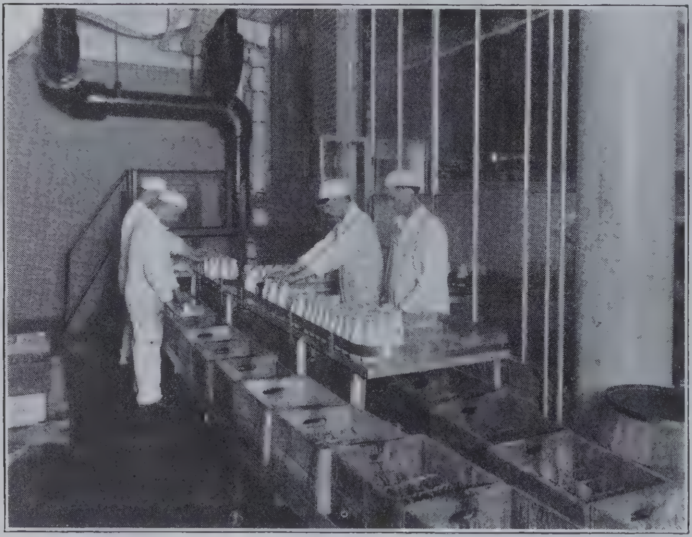
35 degrees. Five pumps, three of them automatic, control the temperature.

In the ice field are 282 three hundred pound cans. The tank also holds 17,000 gallons of brine. Only two ammonia valves are used in the entire plant.

Only sweet water is used in cooling the milk. The cooling of raw milk, pasteurized milk, cream, etc., is automatically controlled throughout. The system will cool 4,000 gallons of milk at the rate of one degree a minute.



Filled bottles are brought by Mojonnier conveyor to accumulating tables, meeting conveyor bringing empty cases, and carrying filled cases to refrigerating room through automatically closing cold storage door.

The water from the mains comes in at a pressure of 12 pounds. Two pumps pick it up and hold it at a pressure of 50 pounds throughout the plant. Four hundred gallons of water are used per minute during operation.

Automatic control enters into the operation of this wonderful plant to a degree undreamed of even five years ago. No employee works over 8 hours and on Sunday 6 hours.

School desks, by American Seating Co., are used in the drivers' room where drivers check deliveries before turning their records over to bookkeeping department at the windows on the left.

One of the show places, if one is permitted to thus term a single room in a plant made up of show rooms, is the laboratory where it is possible to make any test or check known to dairy science. It is the plan of the management to soon install a small laboratory at each country receiving plant. The tests made at these small laboratories will be checked from time to time main laboratory.

This wonder plant is the outcome of severa planning and the expenditure of vast sums of No expense has been spared to make it ideal for pose. The men behind—W. B. Wanzer, preside H. Wanzer, vice-president and treasurer; L. M. H retary; H. Stanley Wanzer, Gordon B. Wanze Sidney Wanzer III, directors, all give unstinted to Neil Mortensen, of Louisville, Ky., for the hig ficient arrangement and installation of the entir equipment. Mr. Mortensen not only supplied a deal of the equipment, but he also had complete of all installations. He is a dairy plant engineer usual ability and is justly proud of his "j Wanzers.

HEAD OF MILK CONCERN DIES.

Funeral services for Ithamar M. Justice, pro Dayton, Ohio, business man, who died at the Mia ley Hospital on June 24th, 1927, were conducted residence, 3305 E. Third St.

Mr. Justice was prominent in Dayton industri for twenty-five years, being identified with a m turing concern which since has gone out of busin then became associated with the Manufacturers' ment Co., and in recent years he was able to devo tically all his attention to the Weaver Milk Co., o he was the head.

Mr. Justice was born in Waldo, Ohio, 64 yea passing his early life in that district. He is surv his widow, Mabel U. Justice, two daughters, Mrs. Weaver and Edith E. Allen of Dayton; one brothe H. Justice, Erie, Pa.; one sister, Mrs. Sally Faust, county, and three grandchildren.

SEE THAT YOUR EMPLOYEES READ TH

The following poem by Edgar Guest, and from the Detroit Free Press, contains some excell vice. It is directed to the young man, but it is good for all of us to read and heed:

NOT HIS JOB.

"I'm not supposed to do that," said he,
When an extra task he'd chance to see;
"That's not my job, and it's not my care,
So I'll pass it by and leave it there."
And the boss who gave him his weekly pay
Lost more than his wages on him that day.

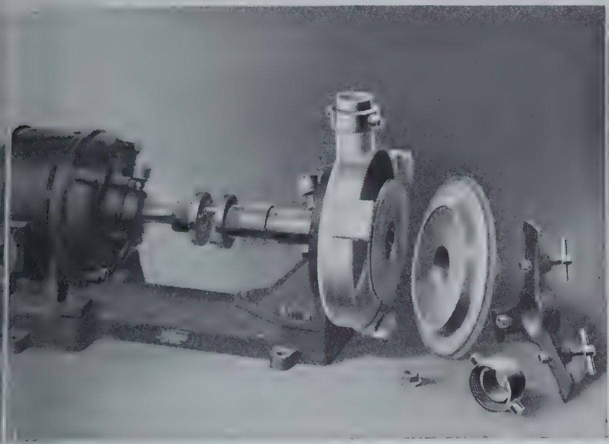
"I'm not supposed to do that," he said,
"That duty belongs to Jim or Fred."
So a little task that was in his way
That he could have handled without delay
Was left unfinished; the way was paved
For a heavy loss that he could have saved.

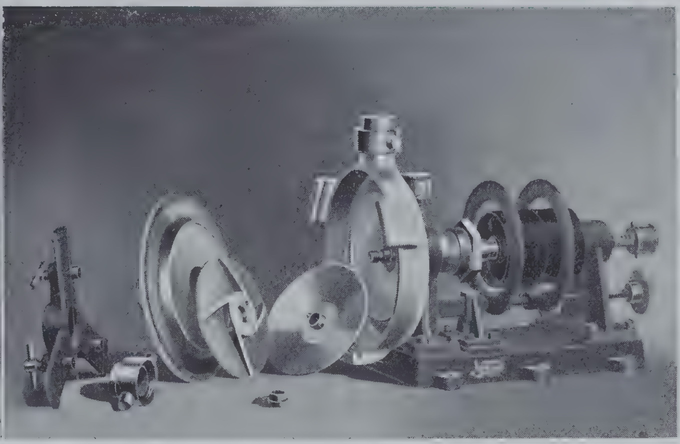
And time went on and he kept his place
But he never altered his easy pace,
And folks remarked how well he knew
The line of tasks he was hired to do;
For never once was he known to turn
His hand to things not of his concern.

But there in his foolish rut he stayed
And for all he did he was fairly paid,
But he never was worth a dollar more
Than he got for his toil when the week was o'er
For he knew too well when his work was throu
And he'd done all he was hired to do.

If you want to grow in this world, young man,
You must do every day all the work you can;
If you find a task, though it's not your bit,
And it should be done, take care of it!
And you'll never conquer or rise if you
Do only the things you're supposed to do.

Nofome Sanitary Milk Pumps





churning, because the enclosed impeller carries e milk to full periphial speed without the vanes ssing through the milk.

Milk passes through the impeller housing, but the vanes do not pass through the milk, which prevents churning and injury to the cream line.

Specialty Brass Co.

KENOSHA, WIS. **ALBION, N. Y.**

When writing to SPECIALTY BRASS CO. *please mention The Milk Dealer.*

TIN coated brass castings were not good enough for the new Wanzer plant. They specified solid nickel alloy castings to be used in all the milk handling machinery. Nickel castings were used because of their properties to resist corrosion and the rough treatment which castings must stand in a milk plant. They are solid, have the same appearance as nickel plate, but are not plated; therefore, chipping and peeling of plate is eliminated and a sanitary surface is obtained permanently.

The Waukesha Foundry Co. was selected to furnish these castings because of their extensive experience in the manufacture of nickel alloy castings.

Such castings as are used in the Milwaukee Bottle Fillers and Conveyors, the Mortensen Pasteurizers, Holders and Cooling Equipment, and the Von Gunten Filters are typical of the class of castings regularly manufactured.

ow Much to Spend in Milk Advertising

Relation of Advertising to Prosperity of the Business. Shall Appropriations Be Made on Basis of Last Year's Sales or on Anticipated Sales?

By W. H. E. REID*

ERTISING, in the field of dairying, is not un-
ike advertising in any other field of endeavor,
a its purpose, and in its ultimate results. The
object of advertising milk and milk products
orm the consumer as to what you are offering
. Advertising is without question one of the
luable selling agencies that is known to the
world today. It is one of the oldest, most
and most extensively used methods of selling.
pay for it, but seldom do they realize that this
demanding a part of their dollar. Advertising
e average consumer, like most all of the other
rendered on a commodity, just one of the serv-
t must be paid for, but without it how could the
r, manufacturer and distributor of milk and
oducts dispose of the 110,000,000,000 pounds of
ilk produced annually in the United States?

anufacturer who makes something that is new
ot a necessity has a real merchandising problem
ting his sales department. Perhaps he must cre-
pular style, or a change in taste. He has a tre-
s job of advertising and selling. Perhaps he
ook upon a milk dealer's task as something too
keep him going.

many milk dealers look at the proposition in ex-
e same way. Milk is not a luxury, but it is the
ecessary food in the world. Few families fail
milk in some form on the table every day of
. Milk has been made clean, rich and safe. Rich,
ilk properly pasteurized certainly has a market.
e world at his door, and within his plant the
at the world wants, the milk dealer is prone to
ilk consumer walk in or stay out, as he pleases.

can be used merely to feed infants and grow-
dren, or it can be used in a multitude of ways
inds of occasions. One milk dealer may sell the
another milk dealer may sell milk and several
oducts.

ther milk is used only for infants and children,
her it is used more by children, or is used in
ude of ways, depends largely, in fact almost en-
pon the milk dealer and his associates. When
unity is educated to a greater use of milk and
er part of that business goes to his competitor,
dealer may know that he is at fault. It be-
self-evident fact that his competitor is the per-
educated the public by constructive and or-
advertising of milk and the milk products.

oncern ever becomes so strong that it can afford
telling the public about the good quality of its
. Milk, as milk, must be everlastingly sold to
lic, and the dealer's milk as exemplifying the
re is in milk, also must be preached continuously.
ings are absolutely necessary to prevent substi-
om being used many times where milk should
and to prevent an alert competitor from reaping
antages of intensive milk education.

But that is not all. Granted that these things are done, it remains for the milk dealer to show the consuming public the many uses to which milk can be put. He should tell the public in his advertising, specifically, how to use milk in various ways. If the public is pretty well sold on the good qualities of milk and its necessity for certain uses, the field that now is open to the dealer is to prove, absolutely to the public, the economy and wisdom of using milk in many new ways.

This should be the most interesting phase of milk merchandising, but it has been shamefully neglected with the exception of isolated instances. In the future, it will be one of the most profitable merchandising efforts ever made by dealers who go about it intelligently and persistently.

With due respect to those milk dealers who have proved themselves alert in modern merchandising methods, the ice cream manufacturers have gone far beyond the milk dealers in individual and co-operative merchandising. Ice cream has not been regarded as a necessity. Its makers have had to fight the luxury idea. They are still fighting it and it proves to be one of the outstanding enemies of that industry. The alertness of ice cream manufacturers is shown in their united effort through their national association to carry ice cream's fight to the public through the mediums that reach the public in a national way.

An ever present question that confronts the manufacturer and distributor of dairy products, as well as any other producer of a saleable commodity, is: How am I going to decide on the advertising appropriation of my company? The answer to this question will depend to a large extent upon the nature of the business, and somewhat upon the man directing the advertising. It also depends on the past business history as it affects the sales situation presented to the advertising department at the time new advertising is under consideration.

One method of building an advertising appropriation for the company is by taking out an insurance policy in the form of an advertising investment to protect the company's good will, much as the company insures its physical assets against fire or any other form of loss. That good will is subject to depreciation and destruction is a fact that has been proven by advertisers who have remained quiet over a period of years, relying on past advertising activities to insure continued success. Such a procedure ends in decreased sales and profits for the company.

Another method is to take a percentage of the sales as a basis for an advertising appropriation, using the sales figures for the past year, or the anticipated sales for the current year. It has been pointed out that this is the method most commonly used, but the percentage adopted by one industry should not be used as a criterion in some other industry where conditions are entirely different.

Another practical method is to levy an assessment on a certain unit of the product, namely, the number of units sold in the previous year or the number anticipated

TRADE MARK REG. ESSEX GELATINE U. S. PAT. OFF.
ESTABLISHED 1903

Improve Your Buttermilk with ESSEX GELATINE

YOUR buttermilk will be improved by the wonderfully smooth and creamy flavor. It softens the curd, retards excessive acid flavor, prevents wheying-off, and imparts a new and delicious smoothness that will quickly increase your buttermilk sales.

For many years Essex Gelatine has been used in the highest grades of ice cream for body and velvety smoothness. You too can now take advantage of this stabilizer for your natural or cultured buttermilk.

Essex Gelatine is economical, you would use only 2 pounds in 100 gallons for a marked improvement. Write for working sample, instructions and prices.

to be sold during the current year. This is the n usually employed by the ice cream manufacture prepares his appropriation at so many cents pe lon of ice cream sold.

Another method, which appears to be more matter of speculation than any of the others, is to all of the money that can possibly be obtained in vertising as an investment in future sales without ence to any basic unit. The method is based on pations and is one that will appeal more partic to the organization newly launched in business.

Another method is the budget system, and need little explanation. Here the advertising appropr is made up at the same time as expenses for oth tivities are computed, the total being figured a estimated income. In arriving at a first estimate the size of the advertising appropriation, sales r or units sold may be kept in mind.

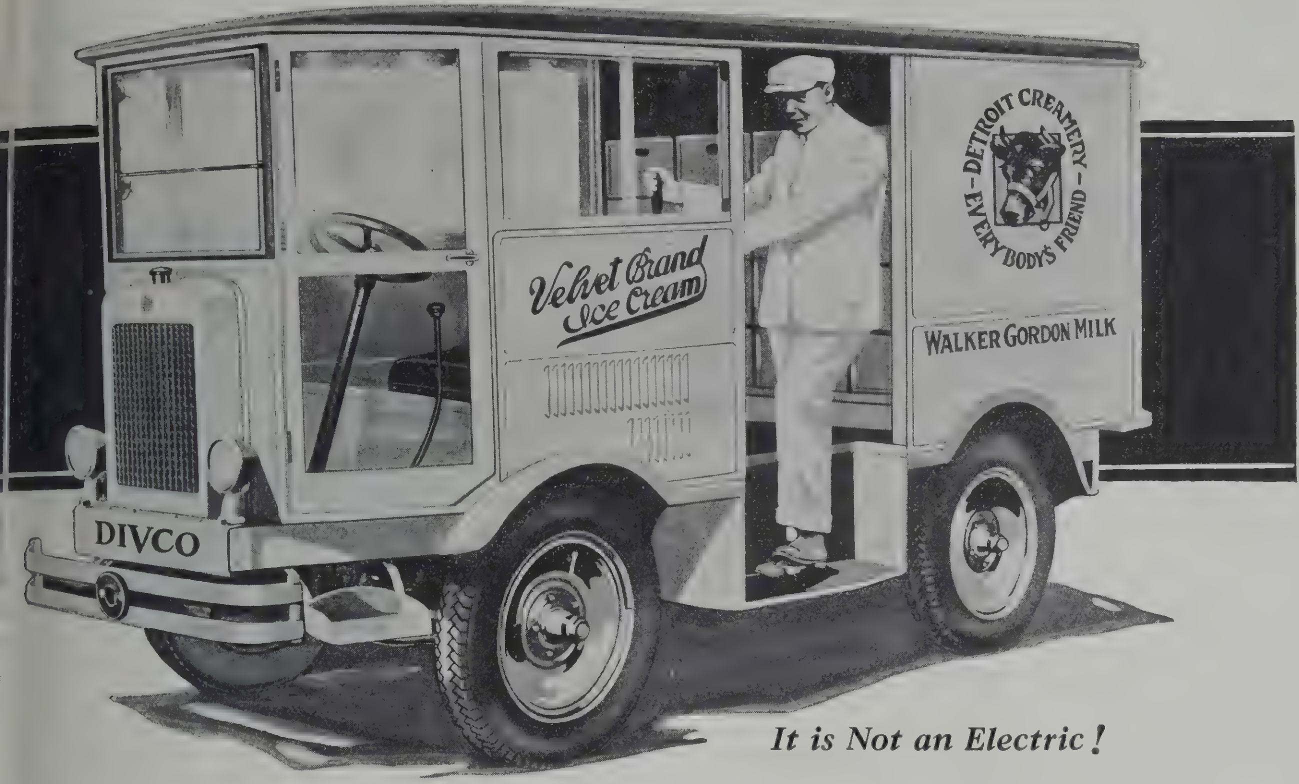
Another method is arrived at quite differently the others and has a limited application to the pr confronting the producer of dairy products. It c in finding out how much advertising it requires tain a new dealer for a given product and then priating sufficient funds so as to obtain as many needed that year. When this method is used, t vertiser endeavors to determine how much the new ness should yield in any given period; or he may determine how much business he can reasonably to acquire from a new market.

Another method consists in appropriating a percentage of the previous year's profits for ad ing, just as percentages of the profits may be app ated to plant expansion addition and repairs.

There is another method that might be called instead of scientific. This procedure consists in observing the activities of one's competitors and setting aside sufficient advertising funds to eq exceed their programs. Fortunately, many concern commence to advertise in this way soon discov true value of advertising and continue to advert gardless of what their competitors' programs m

The combining percentage of sales and the systems is a practice to be considered in the field vertising. A definite percentage of sales is each placed in the advertising fund and is termed the tising budget. This budget will vary according methods and practices of operating the business. the budget prove to be less than the amount d from the percentage of sales, the difference accum to meet the requirements of future years where advertising is needed than is provided for by th rent assessment on sales. However, should the exceed the percentage of sales fund, it must th drawn from past accumulations or from a reserve

The amount of money invested in advertising widely but on the average about three cents of dollar made in the dairy business is utilized in tising. In the course of a year's time this total sents hundreds of thousands of dollars. Adverti commodity such as milk, ice cream, butter, chees is a business in itself that is wide in its scope. T the name of each product constantly before th suming public is a tremendous asset to the sales d ment, resulting in a decided increase in the comp business. The advertisement must be attractive pearance, and should be artistic in design. People at an ordinary advertisement and it passes from mind as soon as it is out of sight, but if the des artistic in nature and causes a lasting impression made on the mind, the person concerned will having seen such on a picture when he purchase or one of its many by-products.



It is Not an Electric!

lere's a Truck that Builds New Business!

The Divco is the first practical truck built expressly for retail milk very—the result of more than 5 years of development in co-opera- with representative creameries. It actually does provide a better, ker, cheaper, and more sanitary method of retail milk delivery. But oes a lot more—it solves one of the most stubborn problems facing mery men today—the problem of building new business, of keeping it and equipment at full capacity.

ivco attracts the highest type driver-salesman—men who are live business getters. It saves to two hours per route per in delivery time; the Divco er has both the energy and to build up his route. Divco no equal as an attention getter; gressive dairy men have fig- its advertising value at up- ds of $50 a month. It carries r advertising message to the doors of the people you want each.

Divco with its great cruising radius and low operation cost enables you to extend your business to new and growing markets not profitably served with other methods of delivery.

There are many other ways in which Divco builds business at a fraction of the cost of former methods. You will find the whole story in the new Divco booklet "Facts About House to House Delivery."

Divco Features

1. *Divco drives from front seat or either running board.*
2. *Divco turns around in a 32 ft. street.*
3. *Divco's insulated body keeps milk in perfect condition.*
4. *Divco carries a bigger load—a load easier to get at, and loads from either side, or front or rear.*

What the Courts Say:

By LEO T. PARKER. *Attorney at Law, Cincinnati, Ohio*

Facts That the Milk
Dealer Should Know

Parker's Important Higher Court Decisions Rep

THE majority of persons obtain insurance. But how many persons carefully read the policies? And what percentage of the holders of policies actually deprive themselves of the benefits therefrom by failing to abide by the contractual relations between the insured and insurer? How many persons study the contents of their insurance policies?

The law is well established that the holder of an insurance policy forfeits his rights to collect the specified insurance if he neglects to carefully act in accordance with the readable stipulations in the body of the policy.

For example, in the case of Meyer Dairy Equipment Co. vs. Connecticut Fire Ins. Co., 287 S. W. 663, the owner of an insured dairy automobile was held not entitled to recover the insurance money where it was shown that the owner failed to abide by the stipulations in the policy that the car was to be locked when it was left without an attendant.

The important provisions of the policy read, as follows:

"Name of assured: Meyer Dairy Equipment Company * * *

"In consideration of a reduction in premium, it is warranted by the assured that the automobile insured under this policy will be continuously equipped with a locking device known as Perry (approved by the Underwriters' Laboratories, Inc., and bearing their label). The assured undertakes during the currency of this policy to use all diligence and care in maintaining the efficiency of said locking device and in locking the automobile when leaving the same unattended.

The car was stolen at a time when it was left unlocked and standing in a street.

The insurance company refused to pay the amount of the insurance on the grounds that the Meyer Dairy Equipment Company did not carry out the agreement specified in the policy.

The dairy company instituted suit to recover the insurance money, contending that since the insurance company had accepted the premium it was liable irrespective whether the car has been stolen when it was locked or unlocked.

The lower court held that the dairy company was entitled to recover the amount of the insurance, but the higher court reversed the verdict and, in holding the insurance company not liable, said:

"It is conceded that the automobile insured was continuously equipped with a locking device, which was maintained in a suitable condition of efficiency, and was usually kept tended, during the currency of the policy, but that the device was left unlocked and the automobile unattended at the time it was stolen, and that thereby the plaintiff (dairy company) breached the condition or promissory warranty of the policy that he should use all diligence and care in locking the automobile when leaving the same unattended, and that such breach defeats recovery under the policy. * * It is conceded that
the defendant (insurance company) learned
breach shortly after the loss occurred and denied
ity on the ground, but failed to return or offer to
the premium, or any part of it, received upon th
ance of the policy. The plaintiff contends that d
ant by its failure to return the unearned premiu
waived or is estopped to assert as a defense the
of the condition or promissory warranty referred
It appears to be recognized as the general rule
return of the premium is not essential to the avo
of an insurance contract for the breach of a condit
warranty. * * If the automobile had been destro
damaged by fire, arising from any cause whatsoe
by stranding, sinking, collision, or derailment, wh
ing transported in any conveyance by land or wa
had been stolen under circumstances other than
it was left unlocked and unattended, at any time
the currency of the policy, the defendant woul
been liable."

However, in Carroll vs. Union Marine Ins. Co.,
W. 691, decided by the Kansas City Court of App
was disclosed that in that case the policy, insu
Ford automobile against loss, by theft, was condi
that the automobile be continuously equipped
Defender lock. The evidence showed that the a
bile was not so equipped at the time of the issua
the policy or at any time during its currency. In
was shown that it was impossible to equip the a
bile with such a lock. Clearly that was a case in
no risk ever attached.

Under these cicumstances, the higher court h
insurance company liable for the value of the car

Dairy Company Prevented From Hiring Competitors' Employees.

In the case of French Bros. Bauer Co. vs. To
Bros. Milk Co., 152 N. E. 675, the higher court he
where a dairy company buys a firm and its nan

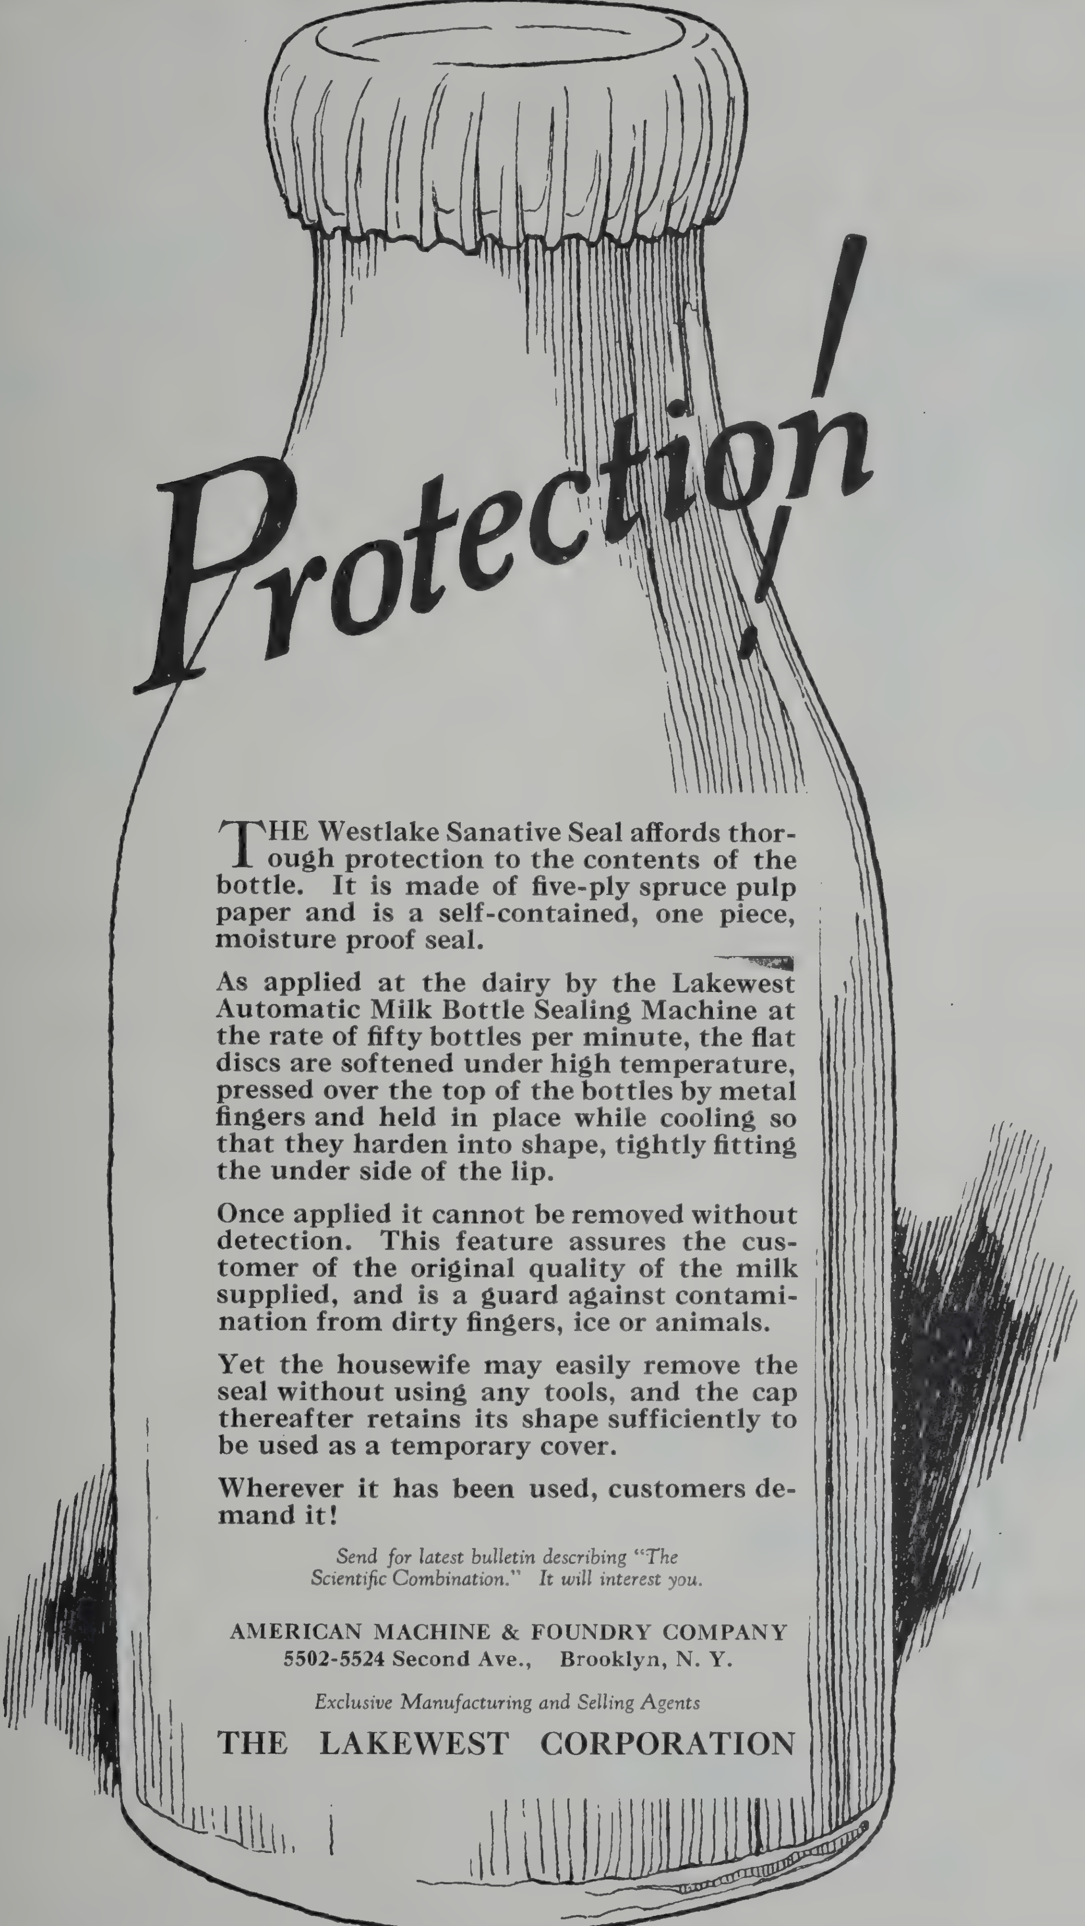
Henry Townsend left and became identified wi



Protection!

THE Westlake Sanative Seal affords thorough protection to the contents of the bottle. It is made of five-ply spruce pulp paper and is a self-contained, one piece, moisture proof seal.

As applied at the dairy by the Lakewest Automatic Milk Bottle Sealing Machine at the rate of fifty bottles per minute, the flat discs are softened under high temperature, pressed over the top of the bottles by metal fingers and held in place while cooling so that they harden into shape, tightly fitting the under side of the lip.

Once applied it cannot be removed without detection. This feature assures the customer of the original quality of the milk supplied, and is a guard against contamination from dirty fingers, ice or animals.

Yet the housewife may easily remove the seal without using any tools, and the cap thereafter retains its shape sufficiently to be used as a temporary cover.

Wherever it has been used, customers demand it!

Send for latest bulletin describing "The Scientific Combination." It will interest you.

Niser Ice Cream Company, which was, in a m
competitor of the French Bros. Bauer Company

In June, 1925, Elmer and Roy Townsend lef
Bros. Bauer Company's employment and became
ted with Henry Townsend in a competing busine
the name of the Townsend Bros. Milk Company.

Elmer Townsend had been the manager in c
the Townsend-West branch, and had had the fu
tion and control of all advertising, and of the l
employees. During this time, while he was the e
head of the Townsend-West Dairy, he spent la
advertising the name Townsend, not using Wes
nection therewith, as desiginating brands of m
termilk, cream, butter, etc.

The evidence showed that it was planned t
in a competitive business under the name of th
send Bros. Milk Company, and that, in carrying
plan, old milk wagons were purchased of the T
West Company, partly through Elmer Towns
manager, to be used by the new company. T
was placed in the telephone book, and vario
plans were made to embark in the new business.

When Elmer Townsend resigned he immediat
into the new enterprise. Various drivers, skip
the chief route foreman of the French Bros. Ba
pany left at once, and became associated with
Townsend Bros. Milk Company.

A campaign was then started to secure custo
the new company, and the old employees of Fre
Bauer Company were employed to assist in carr
this plan, soliciting over the same routes as t
been employed to do by the French Bros. Ba
pany. Many of the former customers of the lat
pany and the Townsend-West Company were se
this method.

It is interesting to observe that the court i
injunction preventing the new Townsend Bros. M
pany from employing the employees of the Fre
Bauer Company, and said:

"The important question, it seems to us, is
ployment of plaintiff's (French Bros. Bauer C
former employees, route men, etc., in securing
new company the customers of the plaintiff com
a written list of the route customers was kept
tiff company (French Bros. Bauer Company),
employees or the defendant company (Townse
Company), took the list and used the same, it i
recognized rule that injunctive relief would be
While there is no written list of such custo
former employees knew and had in mind every
tomer, and the reason for the rule is just as
under these circumstances as though there ha
written list. There is ample authority for hol
such action should be enjoined.

"An injunction will be allowed to prevent

Sale Not Valid Until Accepted.

In Doll & Smith vs. A. & S. Sanitary Dairy
N. W. 230, the question before the court was w

Hydraulic Mining—One of the famous ways engineers utilize the great frictional power of water under high pressure

ne Miller Hydro Successfully Applies e Principle of Hydrostatic Friction to eansing Dirty Milk Bottles---It does away with Brushes of Every Sort!

oduct of the 20th century has so completely revo-
ized bottle washing methods as the invention of
iller Hydro. No machine has saved so much for
ers in general overhead labor costs, bottle breakage
astage of goods.

is mechanically-perfect machine, every type of
unsighty brush as a means of friction is sup-
ed by swirling, scouring streams of caustic soda
terrific pressure.

Miller method of applying this force is most
e; and is entirely different from the attempts of
er manufacturers to produce hydro bottle washing
inery.

In the Miller Hydro the force of water is applied solely through a series of hollow fountain wheels, all of which contain vertical nozzles and sprocket teeth in which a cup chain of bottles are geared direct to the powerful blasts of caustic soda.

By this method alone are bottles subjected to the full power of the great force of hydrostatic friction for the length of time needed to complete the cleaning action, leaving off entirely the doubtful assistance of ill-smelling, unsanitary brushes.

No greater proof of Miller Hydro efficiency is needed than the opinions of more than 3,500 users. Write us today for catalogue and these letters from satisfied users the world over.

Talk No. 9

When B-K is Used as the Exclusive Sterilizing Agent
—Here is what happens

We have had under observation for some considerable time, MILK PLANTS that are using B-K as an exclusive sterilizing agency.

It is apparent that where B-K is used intelligently the cost is a decidedly negligible factor. It is more effective than flowing steam. It does not cause increased moisture on the walls and ceilings. The misty vapor is eliminated. The time involved in making the application is considerably less.

With only eight ounces of B-K properly applied with a compression sprayer, the following apparatus was effectively sterilized: Three 500 gallon holding vats; two coolers 16 feet long by 9 feet high; one 500 gallon reserve tank; two bottle fillers; two 500 gallon buttermilk vats; two 500 gallon cream vats; three 3,000 gallon storage vats; also the connected piping, clarifiers, separators, etc. The time required was less than one hour.

WRITE ME

for further details. Ask me your specific questions. Every plant or factory has its own particular sanitary problems. Our observations have been extensive. Send me a list of your equipment, stating present method of sterilization. I will then be able to give you the benefit of years of experience.

Will also be glad to mail our plan for promoting better care in production of milk by farmers.

J. W. Yates,

Consultant in Sanitation.

B-K
Bacili-Kil

buyer may cancel an order before the same is a in writing by the seller.

The facts of the case are that the Doll & Smi pany signed an order to have shipped by express New York, as soon as possible, certain material. language of the order, the dairy company agreed the price on stipulated terms. The order was a salesman and by him forwarded to the seller York.

The seller received the order on June 14, 19 proceeded to prepare the goods for shipment, not write the buyer. On June 16, 1924, the buye cancellation, and on June 19, 1924, wrote a l cancellation. On June 20, 1924, the seller wrote acknowledging receipt of the telegram and obje the cancellation.

Later the seller sued the buyer for damages the shipment was not accepted by the buyer.

The court held the buyer not liable because a the written order was properly signed, the sel failed to acknowledge receipt of the order and w acceptance of the same **before** the buyer sent t cellation.

* * *

BIGGEST FARM INDUSTRY IS DAIRYIN LARSON.

Dr. C. W. Larson, United States dairy chief ington, D. C., has compiled the following figures dairy industry:

Four and a half million farms in America hav cattle.

The total number of cows approximates 30,00

The annual farm value of dairy products is 000,000.

Population in the United States, potential so milk consumption increase, rises at the rate of 1 per year.

There are 837 active cow-testing associations United States, with an enrolled total of 360,00 each producing an average of 6,500 pounds of m nually.

“All of which means,” says Dr. Larson, ‘ every cow in the nation produced as much mill accredited cattle, the United States would not ne one additional dairy cow for a quarter of a cent

The conclusion is purely a scientific one. Dr. explains, and is true in possibility rather than bility.

“As a matter of fact,” he continues, “it's the of individual owners and not the cows that is dec The movement is toward a higher grade cow, a production herds are, as a rule, increased.

“Dairying is the biggest American farm i The prime issue now is economy in production. that the amount of milk a cow produces and its are the greatest factors in economy has led to t eral development of better herds. Owners rea overhead expense on a poor herd is as heavy good herd. It takes as much time, labor and fe cow that produces only 4,500 pounds of milk a for one that produces twice that amount.”

* * *

REPORT NOT TRUE.

Edward F. Perot, president of Southern Dairi says there is no foundation for the report of a of Southern Dairies with U. S. Dairy Product and Hershey Creamery Co.

No such proposal has ever been discussed, M said.

BESTOV—
Your guide—our pride

Every Bestov Product is guaranteed to fulfill in every way the specifications under which it is sold

The Lansdowne Milking Stool is a fine example of the quality of the Bestov Line. It is made of a single piece of galvanized malleable iron—cannot rust or crack. It weighs only three and one-half pounds and yet is extremely strong. These stools will last indefinitely. The price is low considering the satisfactory service rendered.

The Lansdowne Milking Stool

The Bestov Single Valve Bottle Filler

The Bestov Single Valve Bottle Filler is another member of the very popular Bestov family. The bowl is constructed of seamless spun steel (heavily tinned). A regular tested Bestov valve, with the valve and valve seat ground in is used. This eliminates wasteful dripping. The bottles are filled quickly and economically. The handles are hollow and are large enough to take a man-sized grip. This filler is well worth investigating.

Fluid Milk Market Report for United States for June, 19

By Bureau of Agricultural Economics, Market News Service, United States Department of Agriculture

Table I—Producers' Prices for Standard Grade Milk Testing 3.5% Butterfat, Delivered F. O. B. Local Ship Point or Country Plant.

Prices which appear in this report are secured through the co-operation of milk distributors, producers' assoc and municipal officers. Dealers' buying prices unless otherwise indicated, represent prices applying to all milk de by producers. For cities where a "surplus plan" is in effect, the prices reported in table III are for "basic" qua All per cwt. buying prices have been converted to a 3.5% butterfat basis for comparative purposes.

Sections	Range of June Prices		Prices Compared for Same Markets			
	Number Local Markets	Prices per Hundredweight	Number Local Markets	1927 Average for June	1927 Average for May	192 Aver for J
New England	9	$2.73–$3.95	9	$3.33	$3.33	$3.
Middle Atlantic	15	2.20– 3.00	15	2.76	2.78	2.
E. North Central	22	1.57– 3.10	20	2.45	2.51	2.

* 12 oz. package

GLASCOTE

THIS is the only Vat that has a glass coated coil. No metal is exposed in the liquid area. High glaze glass lining is continuous and smooth over the entire inner surface.

Coil revolves off-center, from the bottom to the top. No swirling or foaming. Air and gases are removed and contents are exposed to maximum heating or cooling area.

All working parts outside of Vat. Leakage of oil, water, steam or brine is impossible. Ball bearings throughout.

Two inch corkboard insulation covered with finished plate steel. Both jacket and coil can be used for heating or cooling. Coil used for brine alone prevents corrosion of steam jacket and prolongs life of unit indefinitely. With ice water, both coil and jacket can be used for rapid cooling.

THE IDEAL UNIT as a Butter Starter, Buttermilk Tank, Pasteurizer, Forewarmer or Ripening Tank. Fastest cooler for condensed milk. Perfect results in making Acidophilus Buttermilk and other lactic or non-lactic cultures. Adopted by largest plants in the Dairy Industries.

Send for new Bulletin and attractive prices. Capacities 350, 550, 750 and 1050 gallons.

STANDARDIZATION PAYS!

That Victor Refrigeration products are the accepted standard is best evidenced by the universal demand for this equipment, on the part of recognized engineers, architects and contractors.

Victor Doors are made in all the standard sizes—specified by architects and engineers wherever refrigeration—either ice or mechanical—is used.

During the past score of years we have endeavored to—and have successfully standardized the sizes of each of our products. The Victor Standard equipment includes sizes and pieces that are special with most other manufacturers. This is possible because of our policy to have what you want—when you want it. You will find both economy and dependability in using Victor Refrigeration Products.

Of course, we make doors and other Refrigeration products to order from your specifications—or our own—but they are made of Victor Standard materials.

A postcard will bring you complete information as to the possibilities of Ice-Conservation in your plant, by the use of Victor Standard Refrigeration Products. Address all correspondence to Hagerstown office.

The Dairymen's Slide Rule

A Little History Pertaining to the Invention of the Slide Rule

By B. I. MASUROVSKY. Consulting Dairy
Chemist and Technologist

The Dairymen's Slide Rule is a derivative of the engineer's side rule and the history of the latter will apply in so far as the logarithmic scales are concerned.

Modern computation owes largely to John Napier (1550-1617), Baron of Merchiston, Scotland, who invented a table of logarithms and gave it to the world in 1614. This invention was welcomed by England and the European countries on the continent. The invention of the engineer's slide rule is based upon logarithms and the first interpretation of logarithms to the slide rule was made by Edmund Gunter (1581-1626), Professor of Astronomy in Gresham College, London. In the year 1620 he designed the logarithmic "line of numbers" which is simply a straight line with the digits 1, 2, 3...10 arranged upon it from one extremity to the other and in such a way that the distance on the line from the end marked 1, to the figure 2, is to the distance from 1, to any other number as the logarithm of 2 is to the logarithm of that other number. In other words, distances along the line were not taken proportional to the numbers on it but to the logarithms of those numbers.

The first invention of the straight edge slide rule was made by Edmund Wingate and explained by him in several publications, the earliest of which appeared in 1630.

The slide rule was used much more in England, during the 18th century, than in Germany or France.

It is not generally known that Sir Isaac Newton ever referred to the slide rule or discovered how it could be used in the solution of numerical equations. For that reason the following translation of an extract from a letter of Oldenburg to Leibnitz, dated June 24, 1675, may be of interest:

> "Mr. Newton, with the help of logarithms, graduated upon scales by placing them parallel at equal distances, or with the help of concentric circles graduated in the same way, finds the roots of equations. Three rules suffice for cubics, four for biquadratics."

The "runner" is claimed to be the idea of Newton, as the first to have thought of such an attachment to the slide rule.

It was not until about 1850 that a French army officer in Metz, then only about nineteen years old, designed a straight slide rule with a "runner" and with a disposition of the logarithmic scales, such as experience has shown to be admirably suited to the ordinary everyday uses of a slide rule. This officer was Amedee Mannheim (1831-1906) and his slide rules are known everywhere as Mannheim rules. Not until 30 or 40 years after its invention did it come to be used in England and the United States.

Great activity has been shown during the last forty years in the direction of perfecting the mechanical execution of slide rules. In America celluloid rules were introduced and being sold by Keuffel and Esser as early as 1888. The Keuffel and Esser are still improving on the slide rule and stimulate the use of same in high schools as well as in colleges.

The Dairymen's Slide Rule has logarithmic scales adapted for figuring dairy problems. It also bears an interpretation of the American Standard Babcock Formula on a straight edge rule. This makes the Dairymen's Slide Rule a standard device for computations and its history is that of the Mannheim Slide Rule described above, except the additional dairy scales which will be described in a later article.

The Dairymen's Slide Rule is patented by B. I. Masurovsky, Consulting Dairy Chemist and Technologist. It is manufactured by the largest manufacturers of high grade slide rules, to be sure of uniform accuracy.

THE DAIRYMEN'S SLIDE RULE IS
DISTRIBUTED BY

THE OLSEN PUBLISHING CO.
501-515 CHERRY STREET MILWAUKEE, WIS.

AND WILL BE SHIPPED ANYWHERE
POSTPAID ON RECEIPT OF $5.50

ONCE A USER BECOMES FAMILIAR WITH MAKING THE CALCULATIONS BY THIS SLIDE RULE MUCH TIME IS SAVED AND THE HIGHEST DEGREE OF ACCURACY RESULTS.

Notice:—In a subsequent article a description of the Dairymen's Slide Rule will be given so far as its development and uses are concerned

NEW MILK PLANT FOR FOSTORIA, O.

Work on the erection of the new milk plant, which the Ohio Co-operative Milk Association is erecting at Fostoria, O., is progressing rapidly. The plant will be in operation the latter part of this summer. C. E. Young, local representative of the association, will have active charge of the plant.

Milk will be received and cooled at the local plant and then will be transported in glass tank trucks to Cleveland. No milk will be distributed locally at the start but may be a development of the future, according to Mr. Young.

HIGHEST PRICE PAID FOR MILK IN MA SINCE 1920.

The average Wisconsin farm milk price fo 1927, was $1.98 per hundredweight. This is the price paid for milk in the month of May, since 19 cording to the Wisconsin Crop and Livestock Re Service.

The May price this year was 18c above the May price and 15c above May, 1925. It was 34c per hu weight above the May average price of the last six These figures indicate that milk prices which ha relatively stable during the past winter are still h

PACIFIC DAIRY SHOW WILL NEED MORE ROOM.

The Seventh Annual Pacific Slope Dairy Show promises to strain the capacity of the Oakland Municipal Auditorium itself and all the adjacent space for livestock show circus tents. This situation developed at the June meeting of the executive committee, called by Acting President W. E. Haley of San Francisco.

President Haley was given reports of the various superintendents. Superintendent of Livestock Arthur Folger of Davis stated that it promised to be the largest showing of dairy cattle on the Pacific Slope. This opinion was based on a visit to the Northwest by Professor William Regan of the dairy cattle committee, and also a canvass of breeders in California by Secretary-Manager Robert E. Jones. Mr. Regan judged at the Spring shows in Oregon and reported much interest among the breeders there in the Oakland show. Mr. Regan has now gone East to select the judges of dairy cattle for the Pacific Slope Dairy Show.

Plans are being made by Ferdinand R. Bain of Los Angeles to exhibit his Jerseys at Oakland. When interviewed recently by Manager Jones he had just returned from the Isle of Jersey where he purchased twenty animals to augment his already famous herd. One of the bulls purchased was a gold medal winner at the Spring show on the Island of Jersey.

Applications for exhibit space within the main auditorium are coming in more rapidly than ever before, according to Superintendent J. J. O'Neil. Kings county, through W. L. Landsborough, secretary of the chamber of commerce, and Yolo county, through W. F. Mixon, secretary of the board of trade, have already made space reservations. The following other organizations have already signed contracts for space: Dominion Chemical Company, Pfaudler Sales Company, Jensen Creamery Machinery Company, Chr. Hansen's Laboratory, Inc., Creamery Package Manufacturing Co., Wells & Richardson Co., Inc., Corbett & Langenheim, Inc., Nizer Corporation, Pacific Coast Glass Co., E. M. O'Donnell Copper Works, and Menasha Printing and Carton Company, also George W. Prising and O. J. Weber Companies, Inc.

Secretary Jay Kugler of the California and Southwestern States Ice Cream Manufacturers' Association has returned from a six-weeks' trip throughout the East, during which he "sold" the Oakland show to Eastern equipment and machinery manufacturers. Mr. Kugler states that the East is more and more turning to the ditional market and that all Wisconsin dairymen will be the gainers on account of these extra markets. West with the expectation of a gigantic growth dairy industry.

This is the fifth year of the Pacific Slope Dairy in Oakland. While it has grown steadily each yea outlook this year, following the meeting of the exe committee, promises an increase of 100 per cent ov year. Those who attended the meeting were: Haley, J. N. Gilman, F. X. McGuire, T. E. Day a A. Green of San Francisco, and S. H. Green, J. J. and Roberts E. Jones of Oakland, California.

⚜

WISCONSIN DEPARTMENT TO ENCOURAGE DISTANCE MILK SHIPMENTS.

The department of markets is about to engag milk grading venture that promises to supply Wis farmers with a market for millions of dollars wo milk each year, which they do not now possess, a ing to Edward Nordman, commissioner of marke

It is a well known fact that Eastern cities, whic a large proportion of the country's population, a ing a hard time of it to keep their people supplie an adequate supply of good grade milk, but they nevertheless exercise due precautions in regard supply lest it harbors disease germs that will caus ness and death among those who use it, esp children.

Modern methods have made it possible to shi long distances without deterioration but Eastern have been loath to let Western milk into their m because of the inconvenience and expense of est ing an adequate inspection system at such long dis Recently, however, the department set in moti machinery for establishing a milk grading system same plan as a number of other farm produc graded. The plan was submitted to the official large Eastern city containing a population of a or more and the department of markets was in by them that milk produced under such grading lations and coming up to the proper standards wo admitted into its markets. This means an out great quantities of milk in this one city alone, b only a forerunner of the other markets that will veloped in other Eastern cities. Of course, as ha frequently pointed out, this does not mean that t ducers of fluid milk will get substantially higher for their milk than is received by the producers used for manufacturing purposes, extra labor an expense considered. What it does mean is that a produced in this territory will be benefited by t ditional market and that all Wisconsin dairym be the gainers on account of these extra market

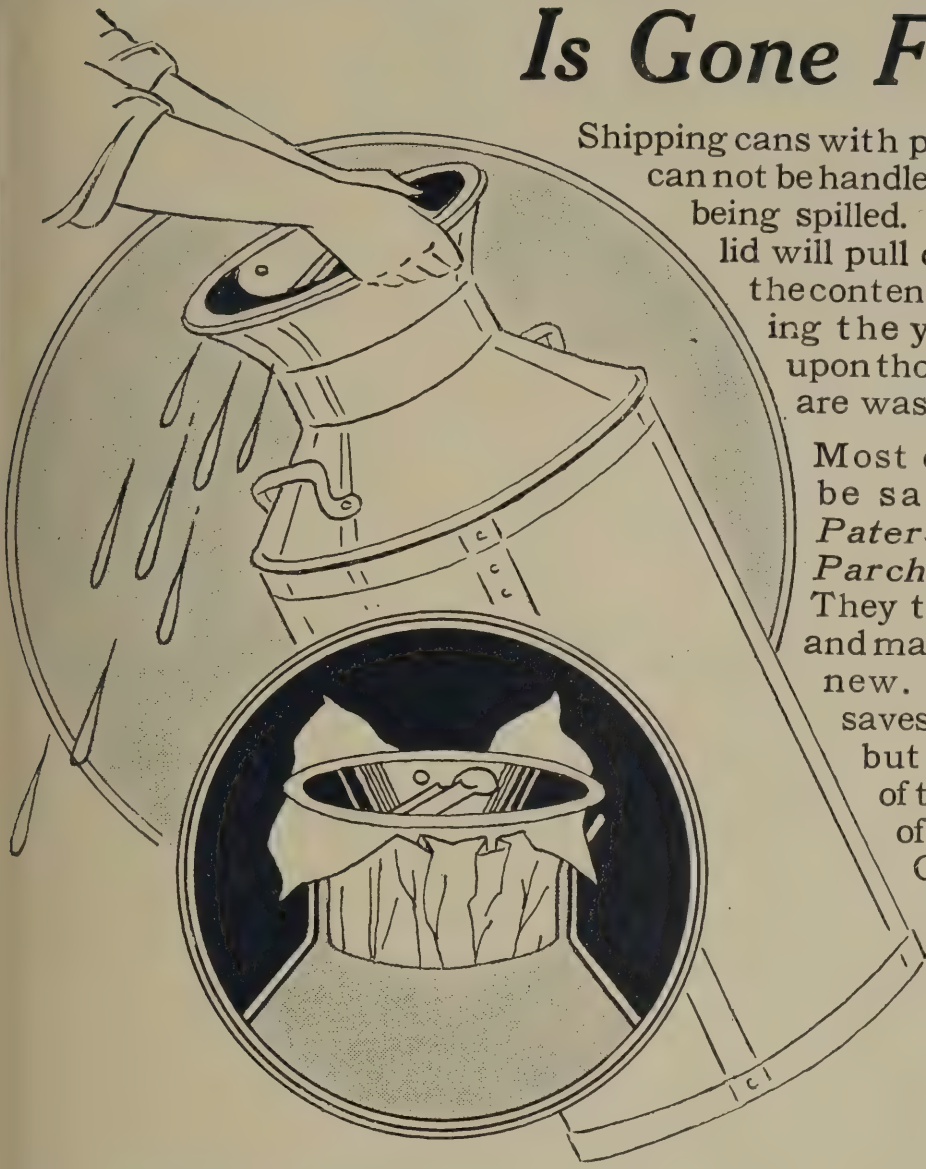
Cream Lost Here— Is Gone Forever



Shipping cans with poorly fitting lids can not be handled without cream being spilled. Frequently a lid will pull out and most of the contents are lost. During the year thousands upon thousands of dollars are wasted.

Most of this loss can be saved by using *Paterson Vegetable Parchment Gaskets.* They take up the slack and make all lids fit like new. This not only saves milk and cream but prolongs the life of the can. The cost of the Parchment Gasket is nothing compared to what it saves. That's why millions are used every year.

Special Offer

Send us One Dollar in coin, stamps, check or Money Order and we will send you, Postage paid, 250 Parchment Milk Can Gaskets made from heavy fifty pound stock cut to standard size 11″ x 11″. If you are not satisfied that their constant use will save you money, the amount you paid us will be cheerfully refunded.

The Paterson Parchment Paper Co.

Chicago San Francisco
Passaic :-: New Jersey

You can save money, too!

You may handle only a few cans a day, or week, or you may handle hundreds. But in either case Parchment Gaskets will save many times their cost. Fill out the coupon below and send for the free samples and instructions how to use them.

THE PATERSON PARCHMENT PAPER CO.
35 Eighth Street, Passaic, N. J.

The perfect container for packaging cottage cheese

A Few of the Reasons why You Should use Tulip "NESTRITES":

- Most practical method of packaging.
- Low cost.
- More sanitary.
- Bright attractive finish.
- Permits of individuality and originality in package.
- Keeps contents in perfect condition.
- Any style or type of printing in any combination of colors.
- Patented wire pull lid.
- Pleasing shape.
- Made in all sizes from 2 oz. to 32 oz.

MODERNIZE the packaging of your cottag
cheese, by using Tulip "Nestrite" Container
It is the proven, practical method of pac
aging and its cost is slight.

A "Nestrite" packaged cottage cheese gains immedia
consumer acceptance because it is sanitary, clean, a
tractive in shape, bright in finish, and permits th
manufacturer to give originality and individuality
his package. Any style or type of printing can be fu
nished and in any combination of colors.

The bright gloss finish, an exclusive feature of "Nestrite" co
tainers, not only makes a more attractive and pleasing packag
but it likewise keeps the contents in perfect condition.

Tulip "Nestrite" Container lids are press fit, and have our e
clusive and patented wire pull feature, making them the mo
convenient, easy, simple and positive yet devised.

Tulip "Nestrite" Containers are made in all sizes from 2 oz. to the 32 oz. Let us quote you on your container requirements. Write for samples and prices. No obligation involved.

The Old Way—*Dragging*

The *Nutting* Way—*Rolling*

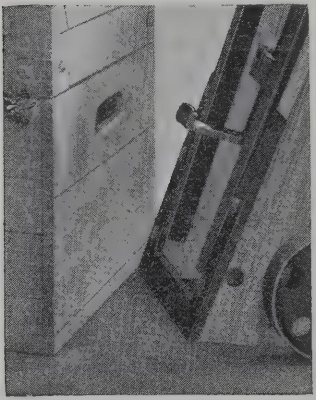
Quick Handling—the Key to Greater Profits

By far the quickest, easiest way to move milk cases short distances about the plant **is with the Nutting Milk Case Truck.**

It's the key to greater profits. While a man drags one stack of cases across the floor he can roll two or three stacks with this milk case truck. It does away with delays at the bottle washer; ends "traffic jams" at the inclined runways. Saves wear on case bottoms. No other truck is like the patented

Nutting Milk Case Truck

You simply grab and go! No nose to pry under a stack. An adjustable hook slips into the hand-hole of the bottom case. The rack supports and balances the load. Easily moves 6 to 8 cases of quart bottles.



Fits any milk case made. Thousands in use. Ask your jobber or write us for catalog C showing this and other floor trucks for the dairy industry.

MUNICIPAL STERILIZATION REQUIREMENT DAIRY EQUIPMENT.

Previous letters in this series have given res studies made of 250 municipal milk ordinances were reported as being in effect in 1925. The da tained in this letter were likewise derived from same regulations.

The table below gives the sterilization require of the 250 cities grouped according to popu A study of the table shows that the most common prescribed by ordinance is sterilization by either water or steam. This holds true for both dairy and milk plants. A majority of the cities re "moist heat plus chemicals" are under a state reg which prescribes this method for sterilization. The icals used must be approved by the health officer.

Those cities which have no requirements sta their respective ordinances are mainly cities o population.

The differences in requirements for steriliza the country and in the city plants are very sl most cases, although some ordinances make no r of country requirements, whereas city requireme prescribed.

WITH THE BENEFIT OF PUBLIC APPROVAL

Just a Few Plain Facts

NO enterprise—or the product of its effort—can long survive without the benefit of public approval.

The instruments known by the identifying name of *Tycos* Instruments. for indicating, recording, and controlling temperature in all its varied applications, industrial and domestic—have been manufactured by the *Taylor Instrument Companies* for seventy-five years.

The consistently increasing demand for these instruments, now numbering more than 8,000 distinct units for industrial and home use, is proof positive that they have the fullest endorsement of public approval.

To indicate and control record temperature honestly, faithfully, and with scientific accuracy is the chief function of all *Taylor* Instruments, from the humblest home thermometer to the most delicately calibrated industrial calorimeter.

The same policy of honesty is translated into our relations with our customers, in a sincere endeavor to serve you faithfully and well.

There is a *Tycos* Temperature Instrument for every purpose. Tell us your need, and we will send you full information—and our Catalog.

A FOREIGN TRADE QUIZ.

The department of foreign commerce of the C of Commerce of the United States issues ever months "Our World Trade," a cumulative ana the export and import trade of the United States. it are based the following questions. How ma you answer?

1. What is the total value of the foreign t the United States?
2. Do we export as much as we import?
3. What is our chief export?
4. What is our chief manufactured export?
5. What continent takes nearly half of our e
6. What foreign country is our chief custom
7. What is our principal import?
8. What continent is our chief source of
9. What country is our chief foreign suppl
10. In what season of the year are our heaviest?
11. In what season of the year are our heaviest?
12. What per cent of our imports are free o
13. Is the volume of our foreign trade large than before the war?
14. What commodity represents our greatest tonnage?
15. What imported commodity far exceeds al in tonnage?
16. How do our exports of finished manu compare with our exports of foodstuffs?
17. How do our imports of raw materials with our exports of finished manufactures?

Here are the Answers.

1. The total value of the foreign trade of the States (exports plus imports) in 1926 was $9,239,
2. Since 1893 U. S. exports of merchandise h ceeded imports.
3. Unmanufactured cotton; value in 1926, $8 000, or 17 per cent of our exports.
4. Automobiles, parts and accessories; value $320,166,000.
5. Europe, which took 48 per cent of our in 1926.
6. Great Britain; in 1926 Great Britain to fifth of our exports, valued at $972,385,000.
7. Crude rubber, with an import value in $505,818,000.
8. Imports from Asia in recent years ha larger than those from any other continent, with second.
9. Canada, supplying 11 per cent of U. S. in 1926, value $475,886,000.
10. U. S. exports are heaviest during the f early winter months.
11. U. S imports are heaviest during the win early spring.
12. In 1926 almost two-thirds (64.4 per cent) imports were free of duty.
13. Yes. The volume of exports is about 46 greater and imports about 78 per cent larger 1913.
14. Coal and coke, our exports in 1926 amou 35,972,000 long tons.
15. Crude petroleum, of which we importe than two and one-half billion gallons in 1926.
16. In 1926 our exports of finished manu were 42 per cent of the total exports, while ex crude foodstuffs were only 7 per cent of the tota
17. Imports of raw materials represented 41 of our total imports in 1926; finished manufactu nearly 20 per cent of the total.

Building Confidence by Increasing Efficien

How Far Should We Go With Our Milk Regulations? Unnecessary Equipment and Labor in Producing and Distributing Milk Means Unnecessary Tax on Consumer

By W. W. SCOFIELD*

IN FRAMING regulations covering milk control by a state department as a code which will be effective throughout the state certain underlying principles should be considered. The regulations should cover essential and necessary points but should not include requirements which may be desirable but which are not absolutely necessary for the production of clean and wholesome milk. If dairymen or distributors are required to spend time or money for unnecessary equipment or for unnecessary labor, the consumer must bear the cost directly by increased price of milk. If milk control officials attempt to enforce a complicated system of milk supervision which necessitates the employment of a large force, the consumer must bear this force indirectly by increased taxation. The regulations should be drawn, therefore, with a view of obtaining maximum results with the expenditure of a minimum sum by the producer, the distributor and the milk control official. The provisions of the code should be limited to requirements which the average local board of health can enforce and should not include methods of control which are highly scientific in nature. As far as possible the codes of neighboring states should be in harmony.

The revision of the sanitary code of New York state forms a basis for discussion. This code recognizes three classes of milk: Certified, raw milk from tuberculin tested cows, and pasteurized milk.

The regulations covering the production of certified milk as adopted by the American Association of Medical Milk Commissions have been used as the standard in the proposed New York State code. In order to arrive at uniformity in the different states it seems wise to follow the standards of the national association but, in New Jersey, we did make certain additions to these standards and the standards were adopted in detail by the state department of health rather than to bind ourselves to any changes which might be adopted by the American Association of Medical Milk Commissions and which might not be proper. This procedure does not alter the work of the medical milk commissions but does give a legal foundation to this class of milk and also gives the state and local boards of health supervision over the production and distribution of this milk.

According to the New York State code, raw milk may be sold from cows which have not been tuberculin tested providing an application for a tuberculin test has been made to the state department of agriculture. Consequently, in reality, but one grade of milk other than certified is established. All persons engaged in handling milk are required to submit, previous to employment, such specimens as the health officer shall prescribe and these specimens are to be examined in a laboratory approved for this work by the state commissioner of health. The importance of eliminating persons from handling raw milk who give off germs of communicable disease cannot be over-estimated. However, most states have not provided adequate laboratories for the conduct of this work and competent bacteriologists must be employed if this work is to be of value. A suggestion has recently been made to our state department of health that persons who give a history
ing had typhoid fever should not be employed to
raw milk until three specimens of feces and urin
at intervals of one week have been examined and
to be negative by a competent bacteriologist. I
that such a procedure would reduce the volume
oratory work greatly and the work would be c
to those cases which are worthy of careful exami
Of course the histories may be very inaccurate a

furthermore, certain cases may have been unrec
and, consequently, persons would not know th
had ever had typhoid fever. In spite of the sh
ings of such a system, it seems worthy of a fair tr

In the New York State code pasteurized
divided into two grades, A and B. These grade
in that Grade A milk is to have a colony count
more than 100,000 per c.c. if pasteurized at p
production and 200,000 per c.c. if shipped by ra
pasteurizing plant and not more than 30,000 per
the time of delivery to the consumer. The em
in plants handling Grade A milk are to submit spe
for laboratory examination before employment.
case of Grade B the count is fixed at 300,000 pe
pasteurized at place of production and 1,000,000
if shipped by rail to a pasteurizing plant and at
delivery to the consumer not more than 50,000
A time limit of 36 hours is fixed for delivery of G
after pasteurization and 48 hours for Grade B aft
teurization. Different colored printing is requi
the bottle caps of the two grades.

Such a system which is based upon bacteria
counts before and after pasteurization cannot
forced by the average local health department a
tainly cannot be enforced by a state health depa
because of the enormous amount of work and c
volved. For example, a large amount of milk r
in New Jersey is pasteurized in New York and P
vania. To enforce such a requirement it would be
sary for the state of New Jersey to send men ove
two neighboring states and then there would be
ally insurmountable obstacles in finding laborator
ities for the plating of the bacterial samples.
state there are great dairy sections which hav
lutely no official laboratory facilities and it is
to make plate counts at a distant point. Where
system is attempted, the consumer can seldom n
difference between the two grades and the incr
sales can usually be attributed to the recomme
of the health officer or sales promotion by the d
tor, coupled with the desire on the part of ma
sumers to buy only the most expensive article w
represented to them as the best. The establishn
such a system implies that separate pasteurizing
and equipment are to be required and maintai
each grade of milk. Such a requirement works
mendous disadvantage to the small distributor
overhead charges are doubled. Investigation
shown that much milk received at Grade A p
paid for on the basis of Grade B prices because
tory counts show the milk to have too high a b
count. However, by the time these determinatio
been made the milk has been sold and consu

AMERICO" THE PASTEURIZER WITH A PURPOSE

The "AMERICO" embodies the most advanced principles in design and construction.

It has no stuffing boxes to gather bacteria and contaminate the batch.

The agitation is gentle. This prevents foaming, churning and breaking of fat globules.

Heating is done with water below 160° F. There is no burning on the coils nor scorching of the product.

The flush type outlet valve is standard on all vats.

Thorough cleaning of all parts is accomplished with ease as the coils can be raised out of the vat.

What an "AMERICO" User Says:
"We consider that 'AMERICO' is nearer perfection than any pasteurizer we have ever used."

e new "AMERICO" with improved coil control

Grade A milk. It also happens that at Grade B plants much milk is received of Grade A quality as improved methods are used by dairymen.

From the standpoint of public health it is vastly more important that all milk sold for human consumption be free from pathogenic bacteria insofar as this is possible, and that all milk sold as pasteurized has in reality been properly pasteurized, than it is to attempt supervision of a system calling for a distinction between two grades of pasteurized milk, either one of which should be wholesome.

In this connection I desire to emphasize the importance of the checking of the details of pasteurization by a trained employee of the state. While some local boards of health may have competent men for this type of work, the average local board of health is unable to employ a specialist and this work should be under the direct supervision of the state, in my opinion. Certain details of this work are worthy of notice. Checking the accuracy of thermometers and the holding period of milk passing through an equipment of the continuous-flow type is most important. The question of the cleansing of bottles and equipment should receive careful attention at frequent intervals by the inspector in order that regular habits which are correct in detail may be followed as a matter of routine by the operator of the plant. The elimination of dead ends or faulty valves in pasteurizing equipment should be insisted upon to prevent improperly pasteurized milk from being offered for sale.

Regulation 19 of the New York State code provides that all bottling plants should be provided with and use mechanical bottle fillers and cappers for the filling and capping of milk bottles. This is an excellent requirement which should be generally adopted.

The provision of the New York State code requiring the submission of specimens from employees of Grade A pasteurizing plants for the purpose of detecting "carriers" is most commendable but there seems no justification in not requiring the same safe-guard in the case of employees of the Grade B pasteurizing plants as both grades of milk should be safe for human consumption. Again, the limited laboratory facilities and even more limited number of bacteriologists to perform this work is a serious obstacle. As in the case of raw milk, it may be possible to accomplish something along this line by securing the histories of workers in all pasteurizing plants as to whether or not they have ever had typhoid fever and to limit the examination of specimens to those who give positive histories.

It is also important to encourage the exchange of information between officials in neighboring territories in order to reduce the amount of travel and ex necessary for each official to secure the informati dependently. In New Jersey, we request and appr information from officials having jurisdiction ove production of foods shipped to our state from states and stand ready to reciprocate by supplyi formation to our neighboring officials in matters are of interest to them. Recently, we have been m a study of the condition of sweet cream as it a in New Jersey from Mid-western states. In ord have more specific information we requested an ceived reports from the officials of those states rega conditions at the points of shipment. These reports been of great value to us. Such information of tions at the source coupled with an examination product at the time of delivery seems to be ampl to result in the distribution of wholesome food reasonable price and without working a hardship the shipper, the distributor or the food official. adoption and use of such a system will do much crease the confidence between officials and wil strengthen the control which each of us hopes to tain over the industries within his jurisdiction.

DAIRY MOVES INTO NEW HOME.

S. H. Keith & Sons Dairy is making ready for mal opening to be held in the near future to cele the opening of their new plant. They are now lo at 710 and 712 Fifteenth St., Altoona, Pa.

Nearly all new equipment has been installed a new location, including two 350-gallon pasteurizers new coolers, an automatic bottle filler and capper, ceiving tank, a new filter and a new separator. A tral heating unit has been installed. This meth heating is the very latest on the market and guara better flavored milk. The Babcock system of te will be used in the new plant and will insure stan ized milk.

Among the features of the Keith dairy is a nev chanical refrigerating plant, including a milk co room 22 by 12.5 feet, and a freezing room 10 feet sq The six trucks used for delivering milk insure service to the Keith customers. Owners of the are S. H. Keith and his two sons, S. Norman and Keith.

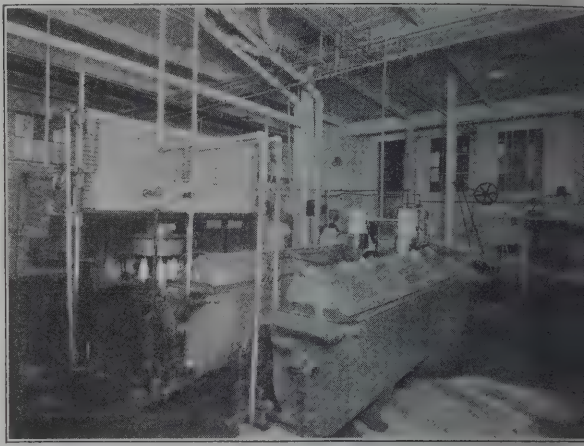
AN IDEA FROM A VERMONTER.

In the city of Burlington, Vt., populated by 2 inhabitants, and located picturesquely on the shor Lake Champlain, in the Green Mountains of gr marble and Christmas trees, is a most progressive milk plant co-operatively owned by the Vermont fa and called the Burlington Co-operative Milk Pro Co., Inc. B. I. Newton is manager.

Mr. Newton has solved the ticket problem fo co-operative milk plant in a most efficient manner. plant has been located in its new daylight hom the past 18 months. Every inch of floor space is ut to some good profit for the company. The front building is rented on the second floor to offices; o ground floor is a most progressive little grocery run by the co-ops; the store next door is also rente Offices and plant of the milk plant are handily lo in the back of the building.



Burlington Co-operative Milk Products Company.

The milk wagon drivers do not sell tickets. tickets are sold at the store and customers drop i buy any amount of tickets up to a $12 book. Pay at the store. The sale is run up on a National cash ter having a marked compartment for the office showing it was a ticket sale for milk. The rest store sales are rung up on the same register but sh they were store sales. In this manner, they ge for their tickets, do not have to go out collectin have an accurate account for their bookkeepin partment of tickets sold for milk from the store. do, of course, have charge accounts with some cust and this is a condition impossible to do away with they are comparatively few and are with peopl settle bills in the store once a month. They get tickets and have them charged to the grocery a and pay it with the regular monthly bill. The d handle only the tickets turned in to them by th tomers. These they turn in with their cash, and records are kept accordingly. In this way the can tell at all times how many tickets are out an many turned in. They sell more milk for cash a away with the collections which most milk dealers

The accompanying photograph shows how w little milk plant is laid out. By-products are which enable the farmers to get the most out o investment. Butter is made and sold in Burli Cottage cheese is put up in half-pound parchment pers and large quantities of this product are sold Casein is also another of their by-products.

The company has a very capable manager i Newton.

OL'S RECORDING (DAIRY) THERMOMETERS

Records of Temperature Guide Pasteurizer Operation

When operatives have ready access to the continuous chart records made by Recording Thermometers they can maintain pasteurization temperatures at exactly the right degree, from the moment heat is turned on until the batch is run off to the cooler. At no time do they have to guess at conditions; a complete story of what is happening is faithfully written into the record line on the chart.

Such records not only help to prevent the bad effects of over- or under-heating, but are *acceptable proof of thorough pasteurization*, where such evidence is required.

The Bristol's Thermometer is simply and ruggedly constructed; in fact there's nothing to get out of order, and they are absolutely foolproof.

Write for Bulletin 349. It gives complete details.

Balance ______________________________

quarts milk, pints, quarts of buttermilk, quarts of sk quarts of 400, ½-pints of 400, butter, cottage che quarts of cream, ½-pints of whipping cream, pints cream, pints of goat milk.

At the foot of the page is a blank line after the si word, balance.

Some of the Windsor Farm Dairy charge accou are on a weekly basis, and still others on a semi-mont basis. Most are monthly, however. The salesmen the collectors. They get out all statements to tomers. Keeping the account record from day to pencils are used. The account books are substanti bound to stand milk delivery handling.

The experience of Windsor Farm Dairy is that drivers—this company invariably refers to them as sa men—can take care of charge account books in an cient, accurate, and dependable way. As the men paid a commission, which is upon collections instead sales, there is maximum incentive to keep interested the accounts.

In the general offices of the company are special cilities for the salesmen, engaged with their account work, and there is, too, a special rack for the custo books. The entire system was developed by Tom ington.

A MILK ORDINANCE THAT HAS STOOD THE TEST IN THE COURTS.

Lancaster, Pennsylvania, boasts of a city milk ordinance that has "weathered" 54 injunctions, the last of which was dissolved on May 25th, last.

The Pennsylvania State Supreme Court even had its "say," and now the Lancaster bureau of health plans to rigidly enforce the ordinance.

For the information of readers of The Milk Dealer we are publishing it in full, as follows:

AN ORDINANCE.

To Regulate the Sale of Milk in the City of Lancaster, Pa., and Providing Penalties for the Violation of the Same, as Amended to August 24, 1926.

Section 1. Be it ordained by the Council of the City of Lancaster, Pa., and it is hereby ordained by authority of the same, that no person, himself or by his servant or agent, or as the servant or agent or another, shall sell or deliver, or have in his possession or custody with the intent to sell or deliver:

(1) Milk to which any water or any foreign substance has been added or is visible therein.

(2) Milk which has been wholly or partially skimmed.

(3) Milk not of standard quality.

(4) Milk concerning which any misrepresentation has been made.

(5) Milk produced by diseased cows or by cows which have been fed unwholesome food or contaminated water.

(6) Milk or cream containing, or which has been exposed to any disease producing bacteria.

(7) Milk which has been produced, stored, handled or transported in an improper, unclean or unsanitary manner.

(8) Milk from dairy herds containing cows which have not been tuberculin tested in accordance with the rules, regulations and practices of the Bureau of Animal Industry of the United States Department of Agriculture and the Bureau of Animal Industry of the Pennsylvania Department of Agriculture.

Section 2. That for the purpose and within the meaning of this ordinance, the term:

(a) "Milk" is the lacteal secretion obtained from the complete milking of cows.

(b) "Skimmed Milk" is milk from which substantially all of the milk fat has been removed.

(c) "Certified Milk" is milk produced and handled in conformity with the "Methods and Standards for the Production and Distribution of Certified Milk" adopted by the American Association of Medical Milk Commissioners, May 1, 1912, and amendments thereto, in effect at the time of production, and certified to by a milk commission in compliance therewith.

(d) "Pasteurized Milk" is milk which has been heated to, and for at least 30 minutes held at a temperature of never less than 145 degrees F.

(e) "Cream" is that portion of the milk, rich in fat, which rises to the surface of the milk on standing, or is separated from it by centrifugal force, and containing not less than 18 per cent of milk fat.

(f) "Homogenized" or "Emulsified" milk or cream is milk or cream which has been subjected to the mechanical process of homogenization, or of emulsification, as the case may be.

(g) "Unsterilized Containers" are containers which either have not been subjected to moist heat at a temperature as high as 205 degrees F. for two minutes or lo
or do not comply with such alternative requirements,
prescribed by the regulations made pursuant to this
nance as may be necessary to effect sterilization thereo

(h) "Person" imports both the plural and singula
the case demands and includes corporations, partners
societies and associations.

(i) "Milk not of Standard Quality" shall mean
having less than 8.5 per cent of solids, not fat, and less
3.25 per cent of milk fat, and cream having less tha
per cent of milk fat. Skimmed milk having less than
per cent of milk solids exclusive of fat shall be consi
adulterated.

Nothing in this ordinance shall be construed to pro
the sale when labeled so as to show its true charact
pure skim milk or of any under-standard milk in which
be included: (a) sour milk or sour cream; (b) butte
or any similar product made from pasteurized milk or c
The aforesaid label bearing the words and figures sha
distinct and conspicuous; they shall be always attach
the aforesaid container. When glass bottles are use
required marks shall be distinctly printed on the c
cover of the same.

Nothing in this ordinance shall be construed to pr
the sale of modified milk in bottles, each holding a s
feeding, into the side of which the name of the person
manufactured or prepared the aforesaid milk has been
or whose name appears on the cap or cover of the sam
gether with the words "Modified Milk."

Nothing in this ordinance shall apply to evaporat
condensed milk contained in hermetically sealed pac
labeled distinctly with the name of the manufactur
person who prepared or put it up, and the brand under
it is made or sold. Certified milk, modified milk and
orated or condensed milk shall mean milk produced
the regulations and supervision of the Bureau of A
Industry of the United States Department of Agricultu
through a committee or commissions, which has certifie
its requirements have been complied with.

For the purpose of this ordinance cows which rea
the tuberculin test shall be considered diseased. Milk
duced at a dairy which scores on the national dairy di
scorecard below 65, and milk sold by or from a city
plant which scores on the national dairy scorecard
80 shall be considered as produced and handled in a
proper, unclean and unsanitary manner. Milk from a
15 days before calving and seven days after, or for such
thereafter as the milk is abnormal, shall be regarded a
sanitary. For the purpose of this ordinance milk w
temperature above 50 degrees F. when leaving plant or
or having more than 100,000 bacteria per cubic centi
when innoculated into standard agar, or more than 50
bacteria per cubic centimeter when counted by direc
servation under a microscope, shall be regarded as u
itary. When milk is bought or sold by the quart or g
the gallon of 231 cubic inches and a quart of 57.75
inches shall be standard and shall be so understood.

Section 3. That every person before selling mi
offering it for sale, or before conveying milk in carria
otherwise for the purpose of selling or delivering it t
city of Lancaster, Pa., for consumption therein, sha
licensed by the board of health of the said city to sell
within the limits thereof, for each and every conve
used in said city from which is sold, exchanged or deli
milk or cream or both. Licenses shall be issued only
name of the owners of carriages or other vehicles,
stores or booths. They shall, for the purpose of this
nance, be conclusive evidence of ownership of the bus

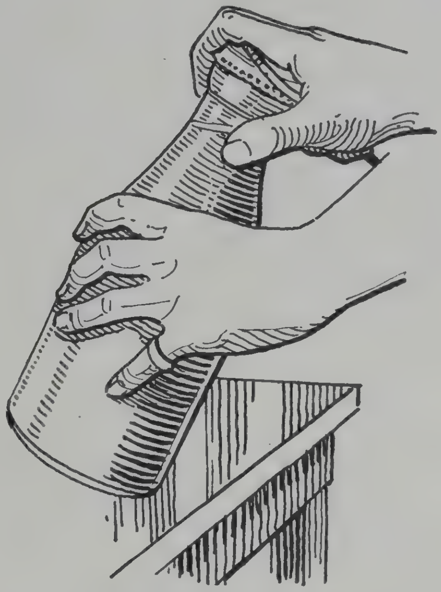
THE
DACRO
METAL CAP

Here at last is the perfect package of Milk or Cream, pure and sweet pasteurized IN the bottle! Made possible by a mechanically perfect closure.



Pure, sweet MILK—delivered under hermetic seal to the home. Handy openers supplied at small cost.

The Dacro Metal Crown—This remarkable cap is made on exactly the same principle as the famous Crown Cork which revolutionized the bottled beverage industry. The Dacro Crown is a hermetic seal. It automatically locks under the glass rim of the bottle. It is scientifically a perfect closure. Sealed with the Dacro Crown, Milk or Cream can be pasteurized in the bottle, an exclusive advantage of this seal. The Dacro Crown covers and protects the pouring lip. It KEEPS clean milk clean! No danger of contamination or tampering with pure contents. And the Dacro Crown can be replaced for temporary covering and seal after opening bottle.

OAKITE cleaning cuts bottle washing rejects!
12 cases rejected in every 400 cases washed
FORMER METHOD
LESS THAN 1 CASE
OAKITE METHOD

HERE is another instance of the effectiveness of Oakite in improving bottle washing results.

A certain dairyman was getting an average of 12 cases of rejects out of 400 cases washed daily. He adopted the Oakite method and now washes the same number of bottles with less than a single case of rejects a day; only one-twelfth as many as formerly!

But that is not all! His bottles *look* cleaner and *are* cleaner; they have a brilliance and sparkle never before attainable when washed by the old method.

Oakite users everywhere find that Oakite cleaning is most economical—both for washing bottles and for cleaning dairy equipment.

Our booklet "Oakite in Dairies" outlines these advantages. Send for a copy.

holders of licenses shall promptly notify in writing the
of health of any change in drivers or other employees,
change in the source of their milk supply. Each
shall be granted on the condition that it is subject t
pension for violation of any provision of this ordinar
of any regulation thereunder, and all licenses shall
newed on or before the first day of July in each and
year.

Section 4. That the Board of Health of the City o
caster, Pa., in addition to its other powers and dut
hereby constituted a milk inspection bureau and shal
power to appoint a competent person who shall be
as the chief of the bureau, and said chief shall recon
and the board of health appoint such assistants as the
of the bureau may need, for the purpose of carrying o
provisions of this ordinance and the regulations pas
pursuance thereof, with such compensation as may be a
ized by the Council of the City of Lancaster, Pa. The
said chief shall enforce the provisions of this ordinan
all regulations passed in connection therewith, und
general direction of the board of health, and be resp
to said board for the conduct of his office. The chief
milk inspection bureau, by himself or a duly auth
deputy or assistant, shall, at least four times each ye
spect all animals, stables, milk rooms, places of bu
shipping stations and other buildings or places used
production, hauling, transportation and storage of mi
sale in the city of Lancaster, using the scoreboards
dairy division of the Bureau of Animal Industry of the
States Department of Agriculture, and rating the dairi
city plants thereon. He shall from time to time inve
the health of employees and attendants handling sai
supply, and the said chief of bureau or the agent or
shall take samples of milk for chemical and bacterio
examination. For the purpose of enforcing this ordi
and all regulations passed in connection therewith, the
said chief and assistants may enter all aforesaid plac
buildings used in the production and handling of mil
or offered for sale in the city of Lancaster, Pa.; he
have access to all animals producing milk for said ci
to all vessels and utensils used in the production, pr
tion for market, and sale of such milk; and he shall
lowed to take samples of milk on offering payment
for; and the aforesaid chief of the milk inspection
shall annually cause to be tested with tuberculin, al
furnishing milk for the city of Lancaster, Pa., such
tuberculin test shall be made by an official of the m
spection bureau, qualified to make same, by a veteri
approved by the bureau of health, by an official veteri
of the Bureau of Animal Industry of the United Stat
partment of Agriculture or by an official veterinarian
Bureau of Animal Industry of the Pennsylvania Depa
of Agriculture. In cases where the owner of a dair
supplying milk to the city of Lancaster elects, for th
of the federal and state indemnity for cows condemned
the tuberculin test, to have his herd come under t
dividual accredited herd plan or the modified accredite
plan of the Bureau of Animal Industry of the Pennsy
Department of Agriculture, the chief of the milk insp
bureau may accept the annual or triennial tuberculin
said herd, made under the provisions of the individua
plan or the modified accredited area plan as meeti
requirements of this fourth section of the ordinanc
he may revoke or suspend the licenses heretofore pr
for, for violation of this ordinance and the regulations
thereunder.

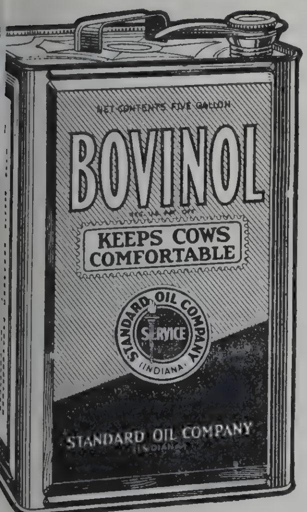
Section 5. Be it Enacted and Ordained, That any
suffering from any contagious or infectious disease, or
whose residence, or among whose associates any con
or infectious disease exits, must keep away from cow
or milk utensils. When any person engaged in the prod

Directions For ncreasing Your Dairy Profits 10%

Spray your cows morning and evening with Bovinol, using the compressed air type of sprayer in which the oil is forced out by air pressure and is further atomized by an air blast. Every square inch of the hide should be covered. It is best to spray against the direction of the hair, so that Bovinol will penetrate the coat.

BOVINOL
REG U S PAT OFF

should be applied freely the first two or three times to build up a protective film of oil on the hair. After the first two or three applications a lighter coating may be used.



Follow these directions and you'll make more money from your cows. Agricultural experiments and practical dairy tests have shown that milk production is increased *at least 10%* by the consistent use of Bovinol.

You'll notice a difference immediately in the behavior of your cows. Twitching, tortured animals become quiet and restful when they are sprayed with Bovinol. Flies light on them but they cannot sting. Cows sprayed with Bovinol are able to produce more milk because they are not wasting energy in fighting flies.

Bovinol is not poisonous. It has no taste or odor. It cannot discolor the hair and therefore is ideal for use on show animals.

If you want to increase your dairy profits, spray your cows night and morning with Bovinol.

Republic
Bottle Crates
"as strong as the Republic"

REPUBLIC Bottle Crates are strong, shock-proof, and enduring. Heavy supporting irons riveted through the sides and ends, long stacking irons from top to bottom reinforce each corner, a galvanized sheet partition holds the supports in position, and all of these are made of "Toncan," the highest grade of galvanized metal obtainable. This metal costs more than other grades, but it lasts longer, resists rust, and adds strength. A high grade crate at a price you can afford. ∴

Let us show you how Republic Crates save money for you. Write for prices and quantity discounts.

SIDNEY WANZER & SONS MILK CO.

ohn Guedelhoefer Wagon Co., Inc.
2-220 KENTUCKY AVE. : INDIANAPOLIS, INDIANA

NO FINER tribute can be paid to Guedelhoefer Wagons than that they were selected as standard equipment by one of the country's foremost milk plants—Sidney Wanzer & Sons.

Any morning as dawn peeps over the skyline of Chicago, you may see an almost endless fleet of Guedelhoefer Wagons drawn up at their loading platforms, ready for the grueling service of the day.

Nor will Sidney Wanzer & Sons' faith and confidence in Guedelhoefer Wagons ever be jeopardized. For into these honestly built vehicles has gone the experience of 47 years in building wagons and trucks for the Dairy Industries.

You, too, may well follow the judgment of Chicago's great Dairy Plant by selecting Guedelhoefer Wagons to deliver your milk.

Indians Gather for Spring Pow Wow

Members of the National Dairy Playgrounds Association
Play, Fish and Eat at their Famous Resort
Near Boulder Junction, Wis.

MEMBERS and friends of the National Playgrounds Association opened up the season at the club grounds in northern Wisconsin with a big stag party known as a "pow-wow." This large tract of timberland and lakes is known as the playground for the people of the dairy industries and all of those that attended this year's spring pow-wow certainly had an enjoyable time.

A big special ten-coach train, with a couple of diners, left Chicago on Friday night, June 17, and the crowd landed at the playgrounds the next morning.

So many things started to happen the minute the pow-wow became organized that the reporter on the job for this paper could not get in on all of them, so he will just struggle through with this story mentioning the highlights.

About ten minutes after the party got on to the grounds the club's largest prize muskie was brought in.

Mr. Art. Galagher and Francis Coleman, Jr., of Chicago got into a boat the first minute they arrived and paddled out about 50 feet and dropped their hook and line in front of a great big 28.5-lb. muskie. And, of course, the muskie proceeded to swallow the hook. Then excitement started, the muskie began to pull th
around the lake. In about 30 minutes the fisherm
ceeded in putting a bullet through the muskie
quieted him down. The fishermen, with their
trophy, are shown in the accompanying cut.

Well, that was a good opener for the pow-wo
soon everybody was on the lake with a line and h
a bent safety-pin, trying to catch a fish.

Later, everybody ate the biggest meal ever con

Then, the improvements on the club grounds w
spected by the entire ensemble. There are ten
new log cabins that were put up last winter. Eve
has, besides the bedrooms, a large living room a
place. They are very comfortable and pleasant
Casino was enlarged 100 per cent and the impro
rangements make it an excellent north woods lod
dining hall was also made twice its original size
kitchen was enlarged and new equipment put in
say, the **eats are good!**

There were baseball games, horseshoe pitchi
other sorts of contests, boat races, casting, et
prizes were awarded to the winners.

Oh, of course, there was a golf tournament

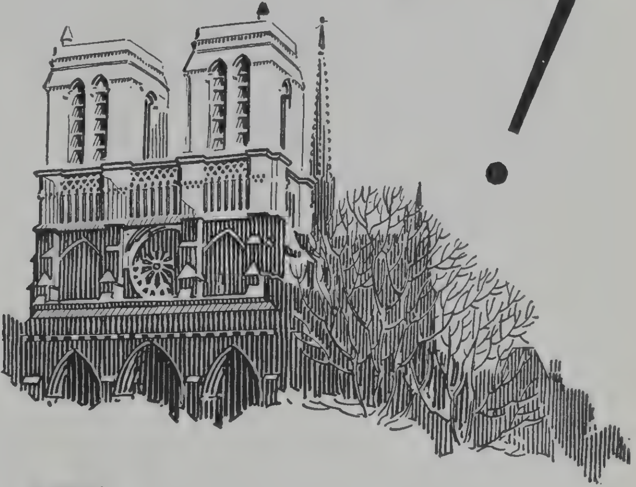
company distributes principally milk and cream the homes in a huge fleet of wagons, early each of the year. Manufacture of creamery butter is on by the company but in a limited way.

company's plant is one of the most modern of its the United States, according to D. A. Yoder, t, and E. L. Jamison, vice-president. The utmost conditions prevail from the time the milk and re received until the filled bottles are placed on steps of the consumer.

MAKE YOUR CONGRESS

a Pleasure Trip of

Europe!



IN the annals of the Dairy Industry the date "June 9, 1928," will be written in red ink! For that is the day on which American dairymen, their families and friends, will embark on a great adventure, which for many spells the realization of life-long dreams. From New York, the magnificent, luxurious steamer, the S. S. Leviathan, will carry us across the Atlantic to Cherbourg.

Our main mission in Europe is, of course, to attend The World's Dairy Congress, the greatest international convention in the history of dairying, which will be held in London, England, from June 26th until July 4th. Having crossed the ocean, we shall not want to return home without a glimpse of those lands we have read and studied about.

To this end the Congress has been arranged so as to allow time for a ten day tour before it opens, on June 26th. A glorious itinerary has been prepared by the American Express Company, which begins immediately upon our arrival at Cherbourg, France, on June 15th.

Paris? Paris—of course! That is our first stop. Then all through the smiling land of France. We visit historical Brussels. A trip of exceptional interest to us dairy men will be taken by steamer from Amsterdam, Holland, to the quaint Isle of Marken, and through Volendam, Edam and Monnikendam, the dairy and cheese-making country. This pre-convention tour terminates upon arrival in London, just in time for the first meeting of the Congress.

Interesting post-convention tours have been arranged, all moderately priced, with an eye to giving us the best in travel, in comfort, in enjoyment, and the most for our money.

There is one post-convention tour to Germany and the Scandinavian countries. Many of us have long wanted to visit there.

Another tour takes in Switzerland, the lofty Alps; sunny Italy; bewitching Venice; Florence, the city of art; ancient historical Rome; Nice, the heart of the Riviera, where nobility and celebrities gather; Lake Geneva; and the dazzling, gay metropolis of Paris!

All information you may desire, such as dates, prices, etc., will gladly be sent you if you write to

TRAVEL DEPARTMENT

William Springs the Big Trip

One of Our Readers Sells His Wife on the Idea of Joining the World's Congress Tour

‘‘WELL,’’ says I kind of casual to the wife the other evening, ‘‘I guess maybe we're goin' to Europe.’’

The wife looked up at me sort of suspicious. ‘‘William,’’ she says severely, ‘‘what are you talking about? Why are we going to Europe? And who says we're going—maybe?’’

Just like my wife—always asking three questions at once, and me not answering any one of them.

‘‘Yes,’’ I says, still easin' around a bit so as not to spill the beans all at once. ‘‘I guess we're goin' to Europe next Spring, my dear.’’ I always call her ‘‘my dear’’ when I ask off to go to lodge, or when I have to sit up with a sick friend.

‘‘Now, William,’’ she says, cuttin' off the words like she meant business, ‘‘sit down here and tell me what you're talking about. Who put this foolish notion into your head about going to Europe next Spring? What do we want to go to Europe for? Tell me, William, have you signed any papers? For two years I've been begging you to take me to Swedink so I could visit my Uncle Theodore, who's been sickly, as you know well enough for a long time. But what did you say? ‘I'm too busy.’ So now you want to go to Europe. Ha! ha!’’ She laughed kind of funny. ‘‘Do you think I'm going to go on one of those big boats and get sick to my stomach? No! Not on your life! William! Why don't you say something?’’

‘‘Well, my dear,’’ I says calm-like, havin' had both ears open so's nothin' could catch and bother me, ‘‘you see, it's this way: Next Spring all the dairy folks in the country are goin' to Europe, or I guess London, to a convention—’’

‘‘Convention!’’ my wife busts in sarcastically. ‘‘I should say not. I don't think by the way you act that you're over the last one yet!’’

My wife is sarcastic like that, especially when it comes to me, and what I've done. But, anyway, I made believe that what she said didn't make no difference at all and said: ‘‘Well, maybe I didn't feel so good, but that was on account of some lobsters that I ate on the train home from Detroit. Lobsters never did agree with me. But like I was telling you, there's goin' to be a World's Dairy Congress in London next June, and you and I are goin' to be in it. The King—’’

‘‘Bah! Who cares for the King—’’

‘‘The King,’’ I said important like, ‘‘is goin' to welcome us. Wouldn't is be nice if you could tell all the neighbors about how you shook hands with the King's wife, and talked to the Prince of Wales?’’

I am clever sometimes, I admit, and that last idea I sprung was a ‘‘wow.’’ She fell for it like a ton of bricks.

‘‘You mean,’’ asks the wife all excited now, ‘‘that I could talk to Queen Marie of Roumania and all that?’’

Poor Elsie. She thinks that there is only one queen in the world. So, to get back at her, I get kind of sarcastic myself. ‘‘Elsie, you surprise me. Ain't you ever gone to school? Queen Marie don't live in England. Roumania is a different country. But I guess I could round up a couple of queens and jukes just the same if you want to do any handshaking.’’

‘‘Well,’’ cuts in the wife, changing around again so things don't look so good after all. ‘‘You ain't s yourself. Besides, this trip is going to cost a money, and you know we can't afford it right no

‘‘Who says we can't afford it, I would like to k says I coming back strong. ‘‘Ain't we both work all these years?’’ Then I lowers my voice, sort o like. ‘‘Elsie, my dear, you need a trip like this think of seeing London and Buckingham Pala Scotland, and—and Sweden, and Norway, a Paree—’’

‘‘Paree? You mean that Paree is in Europ Where they have got all those styles and things

‘‘Sure, Paree is in Europe. For instance, yo buy a regular Paris gown, with a genuine label s somewhere, where it would show easy, and wea every church supper so as to make the other jealous. Wouldn't that be a knockout? And t could see the battle fiends—’’

‘‘We have battle fields enough at home here going away.’’

‘‘And the Eifel Tower,’’ I kept on saying, pa attention to Elsie, 'cause she gets that way som ‘‘And Rome, and the Vatican—’’

‘‘William,’’ says the wife like I had been stealing a drink, ‘‘are you stringing me? All them ain't in Europe at all.’’

I shrugs my shoulders superior-like. ‘‘Listen there's lots more places I haven't told you abo For instance, Copenhagen, where the snuff comes Holland, where they make gin; Amsterdam, whe invented the first dam—’’

‘‘Now, William—’’

‘‘—and Berlin, where all the long streets hav names, and the short street have long names.’’

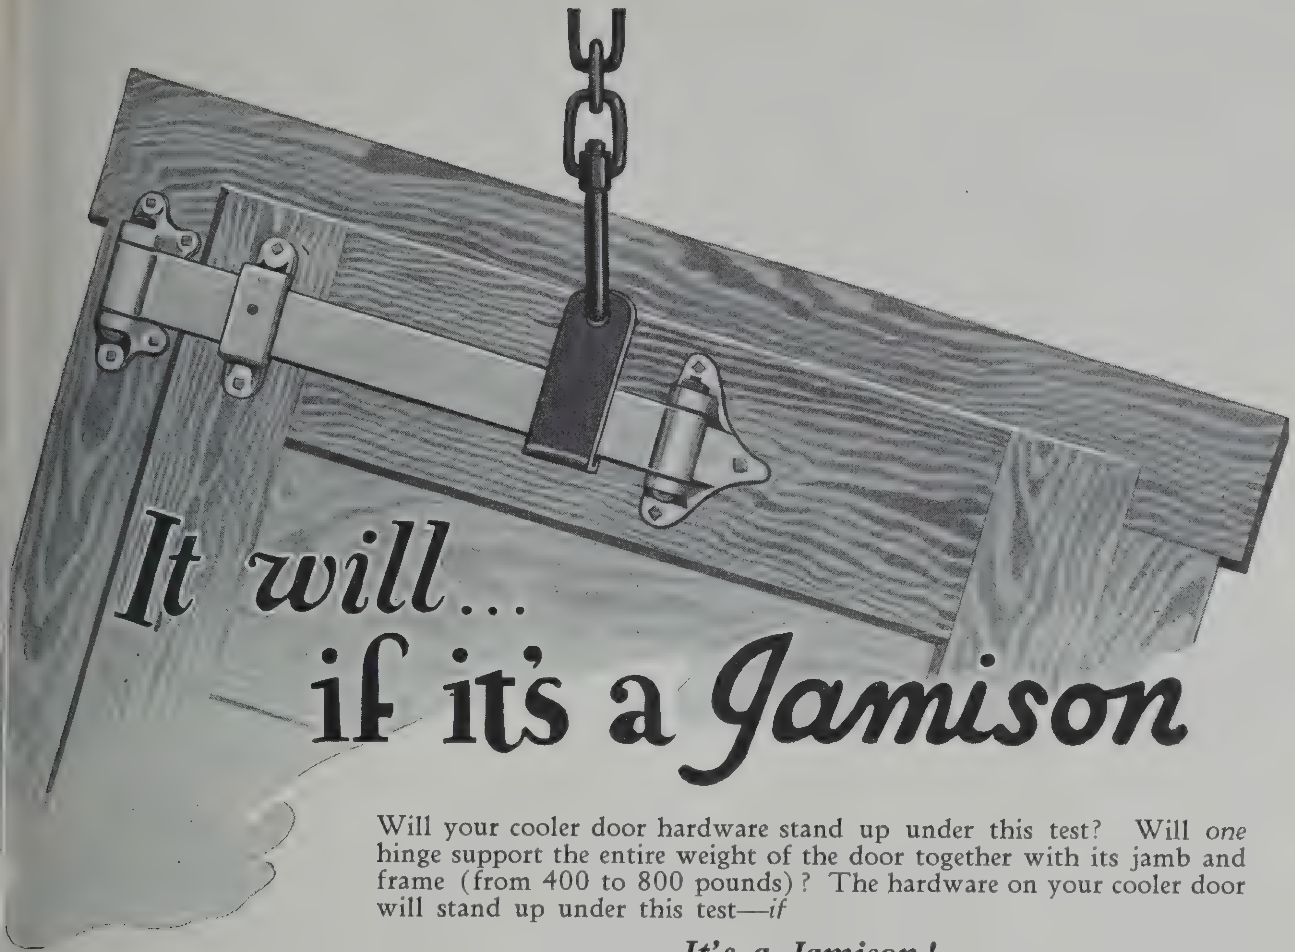
‘‘Why, William; that's where the war started. we could see the Kaiser's palace and everythin woman across the street was just telling me that a cousin in Berlin who is a shoemaker with on Maybe we could tell him that we know his cousi and he would take us around some.’’

‘‘Sure. Europe is full of lots of places. For in we coul see the Coliseum at Rome, where Nero the lions on the poor slaves, and we could see ab place where Julius Caesar was stabbed. I tell you, I says, working up to a climax, ‘‘we got this trip to us. You, anyway, need a vacation.’’

‘‘But it will cost lots of money,’’ says the w ways squeezing the sock, ‘‘maybe we should wai few years.’’

‘‘Wait nothing. This World's Dairy Congres congress every year. There'll be lots of people w going along, and before the trip is over, we wil a whole lot more. And, besides, this trip and con is going to help me in my business. Travelling li is good for a man, and at the convention there w bunch of good speakers tellin' this and tellin' th maybe we can get over some of our troubles plant.’’

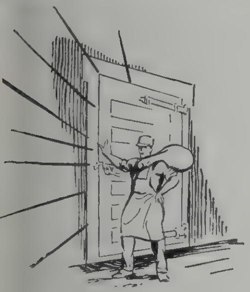
I guess by this time that the wife must hav pretty well sold on the idea, for she sighed kind o like. ‘‘Well,’’ she says in a voice that I kno enough, meaning that she's going to give in, ‘‘so I see the King, and maybe get a hat or dress fron



It will... if it's a Jamison

Will your cooler door hardware stand up under this test? Will *one* hinge support the entire weight of the door together with its jamb and frame (from 400 to 800 pounds)? The hardware on your cooler door will stand up under this test—*if*

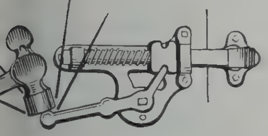
It's a Jamison!



> Note: This is not a stunt performed for demonstrating purposes. It is the way *each* Jamison Door is transported through the plant after it is completed. Step into our plant any time and you will see every Jamison Door carried from the hanging, through the testing, through the crating department into the cars in just this manner.

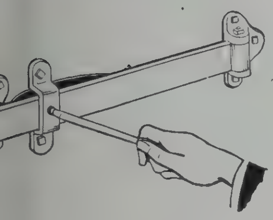
Will your cooler door open almost at a touch and yet stay tightly closed and positively sealed no matter how hard it is slammed? Is the latch on your cooler door fully automatic—self-tightening and of simple, sturdy construction which permits absolutely no rebound? Will it stay on the job doing its work—efficiently—year after year? It will—*if*

It's a Jamison!



Will your cooler door latch stand this sort of treatment? Without breaking? Will it—under severe shock or strain—bend but refuse to break? Will it stand up—as shown here—under pounding with a sledge hammer? It will—*if*

It's a Jamison!



Will your cooler door hardware by its design permit you to instantly and easily adjust it for a constant air tight seal? Will a few turns of a screw driver quickly adjust the tension so as to keep the door tightly and positively sealed? It will—*if*

It's a Jamison!

Send for catalog number 13. It will give you full details about Jamison Cooler and Freezer Doors and other Jamison products.

Jamison Doors

Jamison Cold Storage Door Company
Hagerstown, Maryland, U. S. A.

When writing to JAMISON COLD STORAGE DOOR COMPANY *please mention The Milk Dealer.*

with a label in it, you can go to the convention occasionally to see that it's running right. But, mind you William, there'll be no shenanigans like the last time. You know that your stomach isn't so good any more, and that when you stay up late, you always feel bad the next morning."

So I promised to be good, like I always do, and then don't, and gets up real quick to mail a letter to Mr. Olsen for our reservations on the Leviathan before Elsie could change her mind, because I know her pretty well by this time. Sometimes a change in the weather or a touch of lumbago makes all the difference in the world to what she says one day, and then says the next. But, anyway, here's hoping you can put things across as slick as I did.

EDITOR'S NOTE:—Of course, the "Mr. Olsen" referred to by William is H. P. Olsen, president of the Olsen Publishing Company, Milwaukee. This company is sponsoring the only Official Tour to the World's Dairy Congress, and reservations for space on the S. S. Leviathan are being booked. Join the leaders and send in your reservations now.

⁂

THE LADIES ARE GOING TO EUROPE.

At the meeting in Chicago recently where E. A. Evans of London gave an address on the World's Dairy Congress Tour, there were many ladies present. We are told that Mr. Evans "sold" the ladies 100 per cent on the idea of going along and that they have resolved so. "Our husbands are going to be invited to g us, and they are going to be invited hard," one e astic wife declared as she discussed Mr. Evans'

⁂

SEATTLE SHIPS MILK TO PHILIPPINE ISL

Seattle's milk market has been extend the Philippine Islands. The Royal Dairy, loca 5428 Leary St., that city, is shipping 400 gallons to Manila every two weeks for human consumpt R. Schain, manager of the dairy, has announced company has been exporting milk for the past months

The product, according to Schain, is pasteuriz shipped in the refrigeration department of the s When it arrives at its destination it is said to b perfect condition as on the day of shipment.

Schain explained that due to climatic con there are few milk cows in the Philippines, and t limited milk product of the islands is lacking butter content for which the milk of western W ton is noted.

This state, he declared, produces some of the milk of any in the Union, due to uniformly ideal c conditions.

HORSE SUPREME ON THE MILK ROUTE

Horses used by 15 large dairy companies in Chicago increased 534 head during 1925 and 1926.

Delivery of $1,000,000 worth of milk by horse and wagon instead of by electric truck in Chicago saves $94,100; by horse and wagon instead of gasoline truck, $112,000.

In order to equal horse-wagon efficiency on a milk route an electric truck must deliever 6.412 quarts while the horse-wagon delivers five quarts; and a gasoline truck must deliver 7.43 quarts.

On three delivery routes surveyed, one salesman did not drive his horse a single time after arriving delivery territory, another drove his horse onl while salesman driving electric truck sat down t 75 times during the two hours, 39.3 minutes, he delivery territory.

Average weekly cost of operating a horse-wa livery unit in Chicago, salesman's compensati cluded, is $66.82; for electric truck it is $84.82; gasoline truck $97.23.—Extracts from a circular by the Horse Association of America.

North Mississippi.

The Aberdeen (Miss.) condensing plant, opened a few days ago with many visitors present from Memphis and Mississippi towns, was designed by Memphis engineers, Thos. H. Allen designed the plant. It represents an investment of approximately $100,000. The plant from the very start is paying out $1,500 a day for cream. Five milk routes have been started and a total of fourteen planned. It was financed by Mississippi capital and erected by Aberdeen builders.

East Tennessee.

L. L. Hunt, field representative of the Pet Milk Co., announces that the site for the Greeneville, Tenn., condensing plant has been definitely selected. After a few details are worked out active construction will begin.

Middle Tennessee.

A creamery is being planned for Wayne county, in middle Tennessee. Tests on 82 head of Wayne county cattle were made by a state tester. M. B. McCall's herd of 42, including all milk cows; 12 from Geo. Roberts' herd at Clifton, Tenn., and others were examined and found free of all disease. P. Butler had 23 head tested and there were five milk cows in Waynesboro given the regulation test.

At Murfreesboro, Tenn., Friday, Aug. 5, has been set apart as a day of welcome and rejoicing for the Carnation Milk Products Co. entering that city. The committees from various civic and commercial organizations were selected at a meeting held at the Murfreesboro Bank and Trust Co. in July. A. J. Brandon acted as chairman, John N. Bagwell as secretary. Stanley McNees of the Carnation company met with the local committees.

Burton Wilkerson, president of the Nashville Pure Milk Company, Nashville, Tenn., was elected director of the Fourth and First National Bank, the Nashville Trust Co., and the First National Trust Co. by the board in July. He was named to fill the vacancy caused by the death of Percy Warner, eminent electric traction man of Nashville. Mr. Wilkerson is one of the most successful of the young business men of Nashville and he has been president of the Nashville Pure Milk Co. since its organization. The company of his own that he heads has witnessed a wonderful growth. Today it has agents scattered throughout Tennessee and it handles approximately 2,000,000 gallons of milk and 2,500,000 pounds of butter per annum. It has 52 retail and wholesale routes in Nashville and 150 cream stations in Tennessee. Last year the company paid out a million and one-half dollars to milk and cream producers.

Northwestern Kentucky.

The Evansville Pure Milk Co., Inc., held a formal opening of its new and modern dairy products plant at 11th and Locust St., Owensboro, Ky., on June 27-28, hours 3 to 5 P. M. and 7 to 10 P. M. For several years the company has had a place in Owensboro and the demand in that city and Daviess county has grown so an enlargement was necessary. The new place will give about equal attention to milk products and ice cream, with a capacity for 1,000 gallons daily of each. At the present time about 300 gallons of pasteurized milk products are being delivered by three drivers. A. C. Rose has been general manager for the last five years. R. L. Wible is assistant manager; Miss Bess Hart is office manager. The plant has a 22-ton refrigeration unit, m
ical bottle cleaning facilities, and it spends about $
a year with the Daviess county farmers for the mi
nished. The new plant represents an investment o
000 and is one of the finest equipped and largest in
Kentucky.

Central Kentucky.

The Moore Milk Co. of Logan, W. Va., has pur
the plant of the Sanitary Milk Co. at Frankfort
operated for the last two years by T. A. Bramm
assumed charge July 1. The Frankfort concern a
votes some attention to ice cream. Ben Campb
original Frankfort county boy, but more recentl
nected with the West Virginia plant, will be ma
Central Kentucky ships much pasteurized milk p
to West Virginia, the mountainous terrains not
so advantageous for grazing as central Kentuck
adjoining states draw on the latter for much
product.

Louisville, Ky.

The stables of the Kentucky and Indiana D
414-420 Marshall St., Louisville, Ky., were com
burned Thursday night, July 7. The origin of t
was not known. Three alarms were sent in and
Ed. McHugh and the fire department resp
promptly. Twenty-five horses were kept in the
and 23 were brought out safely. The damage wa
mated at $20,000. Twenty streams of water were
on the building but the hay and feedstuffs in the
made the fire a hard one to fight. The location
central and closely built up section and other pr
was saved.

Memphis, Tenn., and Northern Mississippi.

A conference was held in Lexington, Miss., or
6 between the business folks of Durant and Lexi
Miss., to gather united support for the new Kraft
factory which promises to be in full operation at D
Miss., within a few weeks. Milk will be purcha
large quantities. The plant will have a large ca
at the start.

Ground was broken in July for the $20,000 ad
to the Automobile Bldg. at the Tri-State Fair Gr
Memphis, which will be used to house the dairy ex
at the National Dairy Show in October. Constr
work will be supervised by the Memphis Park Co
sion. Hanker and Cairns, Memphis, are the arch
The present building is 65 feet wide and 330 feet

space of 38,940 square feet. It will be of wood con
tion and painted white. The National Dairy As
tion will have entire charge of the building durin
dairy show.

Klink Bros. Ice Cream Co., Memphis, Tenn
made large improvements and additions at its dair
ice cream plant in the northern part of the city
cent months. The corporation mentioned began
ness Jan. 1, 1927. There are two ice cream rooms
a capacity of 5,000 gallons and freezing capaci
1,000 gallons per day. The room has sunlit wi
on all sides. Two hundred retailers are now usin
cream in Memphis. Eight years ago W. B. Klin
and sons W. B., Jr., and R. H. started the dairy
one truck.

It now operates 15 trucks to deliver ice crear
milk. Klink Bros. have outgrown their own herd
cows and milk is bought from many farmers in S
Co., Tenn. "Have a Heart" ice cream and "Cremo
tage cheese products are handled exclusively by
Bros. The entire interior of the plant is covered
white enamel, all bottles are inspected before the
filled and the purity and excellence of the produ
made for its advance in Memphis.

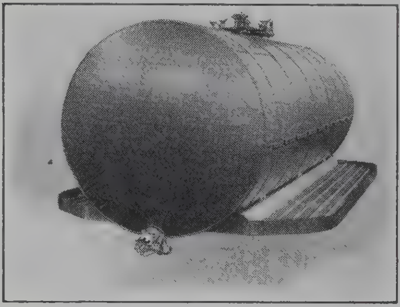
NOTES OF THE TRADE

News of Interest Concerning What Our Readers and Advertisers are Doing to Develop the Industry. We Invite Correspondence Relative to New Products and New Equipment.

PFAUDLER ANNOUNCES NEW "PFEATHERWATE" MILK TRUCK TANK.

The Pfaudler Co. has placed on the market a new lightweight truck tank model which is said to be the lightest lightweight construction being offered to the trade. It has the continuous operation of over a year in the field as the guarantee of its durability. A number of companies have contributed their experience in the actual operation of the equipment, which is offered as a guarantee of its proper construction.



At the present time it is unfortunate, although not uncommon, for the dairy operator to equip his truck with a special body construction, or tank, only to find that after the unit goes into service it exceeds the allowable road weight when completely loaded.

Then one of two things happen—either the unit must be operated at only partial capacity, or part of the special body must be dismounted to meet the governing conditions. Particularly in the spring, when the restrictions are increased in some states, a definite hardship has been worked upon operators whose truck capacities have been greatly limited.

The new Pfaudler "Pfeatherwate" truck tank offers to every dairy product manufacturer an opportunity to use the bulk method irrespective of the stringency of the laws prevailing in his state.

But in addition to these special cases, the "Pfeatherwate" truck tank may well be used by any operator. Its light construction means that a heavier net pay load may be carried with the same gross weight; lower operating costs result, and longer life for all equipment involved.

For those operators facing seasonal fluctuations in demand, means have been provided for hauling extra cans on the platform.

Right along this line, the "Pfeatherwate" truck tank meets a new set of conditions which have arisen in the dairy industry.

The "Pfeatherwate" truck tank is manufactured in four sizes—600, 750, 1,000 and 1,250-gallons. It is described in detail in catalog No. 686, issued by The Pfaudler Co., Dairy Division, Rochester, N. Y.

NEW CORK COVERING.

In response to continual requests received from many buyers of insulation, United Cork Companies, Lyndhurst, N. J., have developed their latest product—Crescent Cork Covering, for cold pipe lines.

Crescent Cork Covering is an efficient and economical insulation for brine lines, ammonia lines, ice water lines, and special cold lines of every kind. It is manufactured of pure, clean granulated cork, compressed and molded in sectional forms, to fit the various sizes of pipe; and the fitting covers are molded to conform to the shape and size of the various fittings in ordinary use. It is finished with a coating of mineral rubber that provides a waterproof covering for all lines and fittings.

It is manufactured in three thicknesses—standard brine thickness—for lines where the refrigerant ranges from 0 degrees F. to 25 degrees F.

Ice water thickness—for lines where temperature of 25 degrees F. and higher are carried.

Special heavy brine thickness—for lines where the refrigerant ranges below 0 degrees F.

The same high uniform quality of product will be found in Crescent Cork Covering as has been maintained cent 100 per cent pure corkboard for more than 20

A service organization for the installation of this is ready to handle complete pipe covering contracts point in the country. Economical and effective co covering is thereby assured. Specifications and pri gladly be submitted on application. Refrigerating manufacturers and contractors are especially reque secure figures on Crescent cork covering. Prompt de and satisfactory service are promised.

A new folder containing helpful data, prices, and information about Crescent cork covering, has just be lished. Copies will gladly be sent upon request.

NEW MULTI-PURPOSE MACHINE.

If you are interested in a general utility machine to many uses in the modern dairy products manufa plant, you will want to write for descriptive bulletin No. 2114 on the new 200-gallon Cherry upright pasteurizer, being introduced to the trade by the J. G. Cherry Company, dairy equipment manufacturers, Cedar Rapids, Ia.

This machine can be used for pasteurizing special milk or cream. Certified milk producers are adopting it as a storage tank. It serves equally well as a buttermilk machine, as a starter can or as an ice cream batch mixer.

It is water-jacketed, the outer jacket being of copper. It is reported that this is an entirely new feature in this class machine. The drive is enclosed and runs The outlet is designed for a "flush valve." It is dri a ½-h.p. motor.

HEATING UNITS FOR SMALL PLANTS.

The American Blower Company of Detroit, Michig recently announced to the trade that they are now p to install their "Venturafin" method of unit heating in plants. Heretofore it has been suitable only for la stallations.

Venturafin is **"the radiator with the blower behi** In its more than 15,000 installations, it has set amazi ords for fuel economy, improved working conditions, around efficiency. It has so far surpassed the "regu cast-iron or pipe coil radiator that it is now the a standard for the heating of large spaces.

Quite naturally, this success has brought with it a ing demand for application of the same principle heating of smaller spaces. Owners of smaller building the same economies that great industrial plants, audit etc., have been enjoying with the **Venturafin** method. fronted by high fuel costs and ever-increasing operatin they too are ready to put **positive heat circulation** to their buildings.

Venturafin Number 2 is the answer to this deman

It is like the big **Venturafin** units in every respect, size. Working parts, construction and operating pri are the same; only, instead of providing circulatin equivalent to 500 or 2,000 square feet of radiation (t

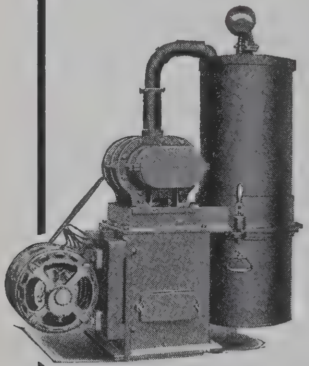
Cut Your Costs with CURRY-VACS

Cow Cleaning with a Curry-Vac

Tests, conducted in dairy barns with Curry-Vacs, show a minimum time saving of 45%. Help costs decrease in direct proportion to the time saved. Cows are kept cleaner with fewer employees by using Curry-Vacs. A cut in labor cost will result in more profits. In addition to that, the cows will be cleaner and healthier.



Curry-Vacs are built in two types, either stationary or portable. The stationary type is for permanent installation where the horses and cows are brought to be cleaned. The portable type may be easily taken to any place in the stable.

DIVERSOL.

"Diversol," manufactured by the Diversey Manufa Co., Chicago, is being introduced to the dairy trade. D is principally a combination of an alkaline sodium pho and sodium hypochlorite in solid solution.

DIVERSO
CLEANSES
DESTROYS BACTER
DEODORIZES
CONTAINS NO ACID—POISON
OR OTHER INJURIOUS SUBSTANC
KEEP IN COOL PLACE
DIVERSEY MANUFACTURING
CHICAGO

Diversol is used by dissolving the crystals in water. The strength of the solution should depend on the amount of contamination to be removed. For general cleaning add one-half ounce Diversol for each gallon of water used. If the contamination is unusually heavy, three-quarters of an ounce or one ounce per gallon may be used. If a scouring action is desired, the dry crystal can be directly applied with a wet brush, followed with a rinse. When used for sterilizing purposes only add one-quarter to one-third ounce for each gallon of water. At this strength Diversol solutions will s and at the same time remove invisible films which hav left by washing powders previously employed. It is im that these films be removed, for beneath them quite fr ly bacteria thrive and subsequently contaminate milk. ing and sterilizing with solutions made of Diversol carried on either in cold or warm water—not hotte the hand can stand. Solutions that have been us cleansing pasteurizers, homogenizers, coolers, vats and equipment should be saved for further duties in cl and deodorizing floors.

March 9, 1927.

Gentlemen:

We are enclosing herewith our photo showing the erection of the fur storage vault. We thought this would be of interest to you.

Allow us to tell you how very pleased we are with the construction of same. The job is being done in the best possible manner, and we felt that you were entitled to this expression from us because of the splendid work which is being done on it.

Very truly yours,

WOLF & DESSAUER CO.

GIL:HS

Read the above letter

Manufacturing and selling Mundet Jointite Cork Board is only a PART of the insulation service performed by the House of Mundet. Our contract department installs it, complete. They do their work "in the best possible manner," as expressed by Mr. Latz in his letter.

Mundet Jointite Cork Board
TRADE MARK

No matter what the nature of your business may be—Milk, Fur Storage, Ice Cream, Butter, Ice Making, Meat Storage, etc.—you NEED refrigeration, and you therefore NEED cork insulation.

You know that PURE BAKED CORK is superior insulating material, but do you know that UNLESS CORK IS PROPERLY INSTALLED ITS INSULATING VALUE WILL DECREASE?

Cork MUST be installed properly if maximum insulating value is wanted continuously thereafter. To insure correct installation therefore, put it in the hands of Mundet's contract department.

We cover the entire United States. Mundet has trained engineers everywhere who gladly help with insulation problems without the least obligation.

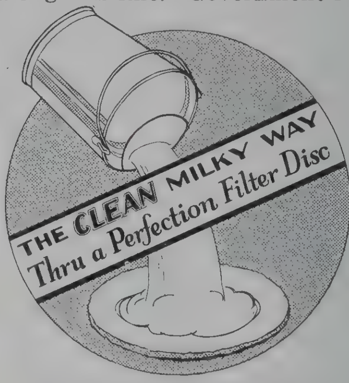
SCHWARTZ COMPANY INAUGURATES CAMPAIG CLEANER MILK ON THE FARM.

In the interests of creamery men in particular
dairy industry in general, the Schwartz Mfg. Com
Two Rivers, Wis., has undertaken a campaign havin
ultimate object the education of the farmer to the ad
and necessity for the proper filtering of milk at its s
on the farm.

There has long been a need for an educationa
along this line. Government reports estimate that th
losses in unsanitary
—and the losses inv
the lowering of the
and value of the com
products of raw
amounts to millions
lars each year.



THE CLEAN MILKY WAY
Thru a Perfection Filter Disc

The Schwartz Trade-mark.

The Schwartz Mf
pany proposes to di
attention of the in
elements entering
ultimate production
dairy product with
towards arousing a c
tion along the line
bound to result in
more healthful, mo
tary and more p
dairy products.

It proposes to do
two ways—(1) through a direct appeal to the fa
means of circulars, inserts, placards at delivery stati
ultimately magazine ads, which will not only brin
attention the advantages actually inherent in keepi
clean—but also educate him up to the necessity
method of making his milk more valuable commerci

Secondly: To bring to the attention of dairy
manufacturers the necessity for demanding and getti
milk from their patrons—and suggesting a plan wh
make it simple and practical for them to get their
to insure the delivery of clean milk.

The Schwartz Company are pioneers in the field
ing material. They produce every type of cloth pro
the dairy trade such as filtering discs, filter bags
squares, tubes, cheese and butter tub circles, etc. Th
every type of filtering disc including the natural finis
finish, No. 10 bleached and No. 16 unbleached filteri
They have developed the Schwartz cloth faced filter
a special type which is becoming standard with ma
dealers.

This disc is made of specially long thread cotton
faced with a cheese cloth covering which is actuall
into the cotton. This cheese cloth "facing" not onl
a stronger and more easily handled disc but it is

Home of Schwartz Mfg. Co., Two Rivers, Wis.

efficient because the cloth not only holds out the la
ticles but it prevents the disc from disintegrating and
apart—which would result in milk flowing through
being filtered.

Myron E. Schwartz, the man behind the educatio
has been prominently identified with the developme
ering material for almost a decade. He tells us that
through the plan not only to benefit his organization
industry as a whole—for, in reality, the basic proble
problem of the entire industry rather than that of
vidual firm—and its results will naturally react acc

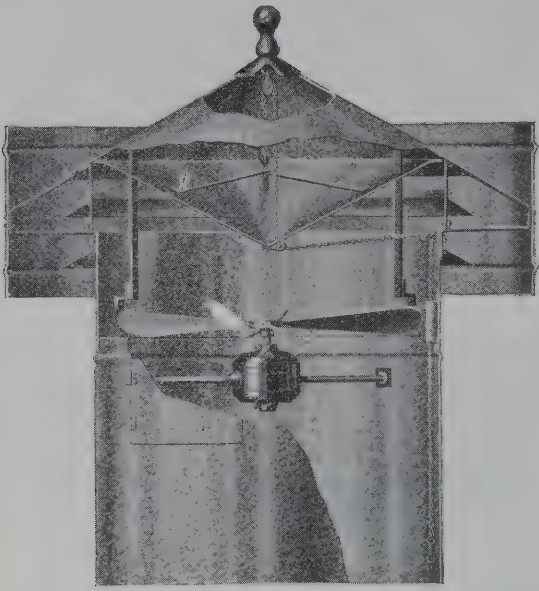
of the Burt cone damper ventilator. Noise and vibration is direct on the shaft, both being suspended in the air shafting eliminated by means of composition fiber absorbers, as illustrated.

This system of ventilation accelerates the movement of the hot air fumes and steam upward. At times the natural movement of the warm air and steam upward may be sufficient, but when this normal condition does not exist, the motor fan may be put in operation, to provide forced ventilation.



These ventilators are provided with an extra wide band, making them storm-proof and increasing the efficiency of the ventilator when the motor and fan are not in operation. The inverted cone which is used for a damper does away with the possibility of any eddying currents of air forming in the top of the ventilator, and insures that no abrupt angles will be encountered in expelling the air. The damper is equipped with fusible links which automatically close in case of fire.

Fully enclosed Emerson motors are used. The enclosed motor feature makes the ventilator especially adaptable under such conditions as exist in dairy products plants. The ventilators are furnished with air shafting from 12 inches to 48 inches in diameter, with capacities ranging from 1,350 to 14,725 cubic feet of air per minute. The ventilators are furnished complete with square base made to fit the pitch of the roof. They are the result of a four year period of experimentation, and will be furnished to any responsible firm for two weeks on trial, subject to return at no cost if it does not handle the ventilating problem satisfactorily.

of the town of Schley held a meeting of its stockho
cently for the purpose of devising ways and means t
their additional business. The company will now
close to 10,000 pounds of milk daily and faces the m
perous period in its history.

Minden, La.—An effort will be made in Septembe
centrate all the efforts of all the parish and city ass
on one end, namely to make this a dairying parish, a
to Prof. E. S. Richardson, the parish superinten
schools.

Marshall, Tex.—Marvin Turney, prominent busine
said in discussing the survey the Harrison County Da
Association and the chamber of commerce is makin
duce national milk condensing and canning comp
estabalish plants here: "The establishment of a sta
ket by the dairymen of Harrison county is the bigge
that they can do. A market for the products of this
would be equal to the building of a large factory in o

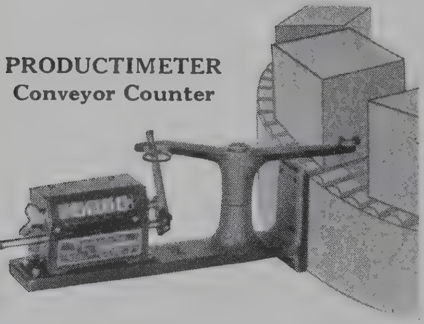
Hudson, Mich.—Ames Brothers have sold thei
business to Harold Lemon of north of the city, w
take possession of the same by October 1. The dai
is a modern one.

Findlay, O.—The Findlay Dairy Co. has the healt
public at heart and sells only certified milk.

Bowling Green, Ky.—According to a survey

COUNT 'EM ACCURATELY—BOTTLE or CA

PRODUCTIMETER
Conveyor Counter



Productimeters recording daily volume on important machines or operations give you an accurate count, in plain figures, quickly and dependably. They tell you at a glance just what has been done in a given period of time; make it easy to figure costs, bottle and case requirements, etc.

Built in various models—to fit washing, filling, sealing machines, conveyors, and to tally bottles, cases, packages, boxes. Our Service Department advises you which model is best for particular applications. Write for the Productimeter Catalog, telling us what you wish to count.

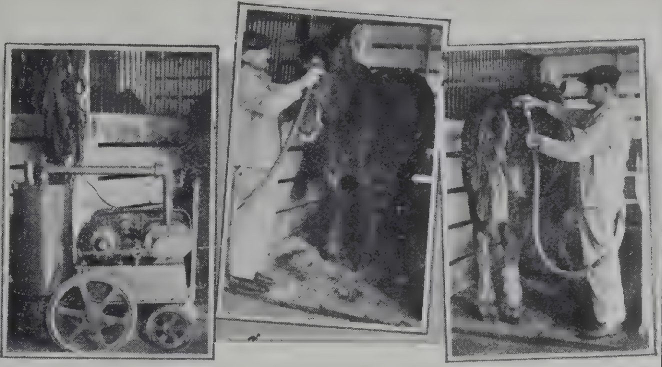
ingham, Wash.—Matters pertaining to the dairy in- all over the state were discussed, including the new law which went into effect June 10, at the annual



PERFECT!

The ATWOOD
— FOR —
HORSE GROOMING

FIRST IN THE FIELD—and many years of experience since, has made the Atwood vacuum machine for horse grooming perfect in every detail. Substantial, strong, and rugged, it will last a lifetime. The tool will get down to the skin and loosen every particle of dandruff, dirt and dust. This dirt is not only dislodged, but completely removed, and with it go all vermin, to a sealed container where they die. It eliminates skin diseases and other horse ailments, and requires less than one-fourth the time to do a more perfect job of grooming. Let us show you how other dairies have found the Atwood a profitable investment.

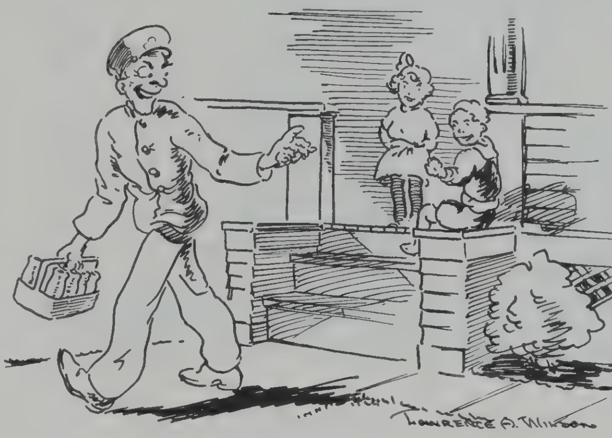
tington, W. Va.—The milk and dairy inspection ordi- ecently passed by the board of commissioners, was d by the citizens' board at the monthly meeting. A logist from Kentucky has been employed.

MIKE THE MILKMAN

IMPROVING THE CHILDREN

The Jenkins family down on Reeves have plump and healthy kids, they're just a fine as baby beeves from shoestrings to their lids! They wear a bright and ruddy glow, their arms and legs are round; each day I notice how they grow, they're full of pep and bound! I take much credit for that growth, that skin, and hair of silk; 'twas due to me, upon my oath, they started drinking milk! When they were younger, I declare, they were such puny mites, their parents simply didn't dare to let them play with kites, because the kites might fly away and take the kids along; they did not grow from day to day; they were not well and strong! In those old days, as I recall, a pint of milk, or less, was ordered there, but that was all, for little Hal and Bess! One day the mother said to me when I was at the door, "I really, really, can not see why they're not growing more!" That was my chance to say my say; said I, "Don't think me gruff when I make bold to state today they don't drink milk enough! If I may leave you three full quarts each morning for a spell you'll soon be giving out reports with better tales to tell! I tell you, Mrs. Jenkins, now, my plain advice is this: Trade off your doctor for a cow, you can not go amiss! I'll leave three quarts of milk with you for two full months, each day, then I'll be glad to hear your view and hark to what you say! If when two months are up you think no changes have been wrought, I'll then refund for every drink of milk you ever bought!" She took me up! She started in three quarts at every splash! I knew full well that I would win,—I knew I'd keep the cash! Right from the start those children gained; they grew like noxious plants; they grew full-limbed and stronger grained, began to run and dance! My, how that mother praises me! I banished her distress! "Mike is the doctor here," says she, "who treats our Hal and Bess!"



—J. Edw. Tufft, Grand Forks, N. D.

⁂

CANADIAN DAIRY MERGER.

The Quebec Dairies Co., Ltd., has acquired all the capital stock of the Mount Royal Creameries, Ltd., whose sales increased from $505,935 in 1923, to $1,311,768 in 1926. It is understood that new financing for the company is shortly to be undertaken by a Montreal syndicate.

ELIMINATING ICE IN THE MILK PLANT.

"THERE is just as much sales resistance in the dairy business as in any other business which retails quantities of a low priced product," according to H. A. Hescock, one of the owners of a New England model dairy located near Westfield, Mass., a few miles from Springfield.

"Successful building of a dairy business involves just as careful selling as the marketing of any other product selling in the 10-25 cent price range. The dairyman who tries to market 'just milk' is up against a competition that is bound to restrict his number of customers.

"The dairyman who sells the public on the quality of his milk, its cleanliness, and his own unvarying standard of real service, is the man who is getting above the dead level of routine 'milk peddling.' That's the man who is tackling his business from a 'milk selling' angle instead, and he is the man who will find his market is not restricted by any competition, no matter how many other dairies may be operating in his territory."

Mr. Hescock, in partnership with E. C. Johnson, owns Meadow View Farm, a 100-acre dairy plant one mile southeast of Westfield. A herd of 50 Guernseys and Jerseys is maintained, and in addition milk is purchased from other herds nearby. Practically the entire output of the dairy is sold direct to consumers in Westfield.

Meadow View Farm dairy, with its roomy and spotless buildings, is one of the show places in the dairy industry of New England. Mr. Hescock, a dairyman for almost his entire lifetime, has been in his present location for 17 years. The dairy's constantly increasing business gives evidence of the manner in which
ing theory of Mr. Hescock and Mr. Johnson is
out in actual practice.

"Getting new customers is largely a matter o
ing the ice' which the public has formed arou
in the form of sales resistance. And one method
in 'breaking the ice' around the public was
away from the ice right in our own dairy.

"We believe that getting down to fundam
the best way to build milk business. Better milk,
milk, colder milk, is the best advertising that
can get. That's the sort of advertising that reall
Mrs. Henry Jones want our milk when she fi
Mrs. John Smith next door is getting it and find
ter that the kind Mrs. Jones is using.

"Therefore, we believe that successful buildi
route list begins right in the dairy itself—in its
ery and methods.

"So, when I say that we broke away from ic
dairy in order to 'break the ice' around the p
wanted to reach, I mean it literally. We disca
use of ice in the dairy, and adopted electric refri
instead, as the best means of convincing our pro
buyers that Meadow View Farm milk was the m
wanted.

"I have been in this vicinity for 17 years, a
engaged in the dairy business all my life. In t
I have learned the importance of making my
bond among the people with whom I deal. I ha
them realize that milk is just as good a milk
give them.

"Early in 1927, after I had been studying ele
frigeration, I began to wonder if the milk I wa
really was just as good a milk as I could produ
was not giving satisfactory temperatures. The
count was low—but not as low as it would be wit
temperatures. The bottles were not as cold
should be when they were placed on the cu
porches. Our dairy was up to date in every res
one—I decided that ice refrigeration was obsol

"In March of this year we abandoned use of
installed Frigidaire. The equipment, which co
was installed in the big walk-in cooling roo
aerator is used, as the milk is cooled entirely in t
ing room.

"The decision to abandon ice was, on the fa
a rather radical step, for immediately adjoining t
cooling room was an ice house, filled with ice.
winter we had filled the ice house with pond ice
in milk cooling. But we had been convinced
was not doing the sort of job we required in bu

milk business, so there was no question about dis- ing its use.

here is still a lot of ice in the ice house. We are it at wholesale prices to anyone who wants it— ice is going into our dairy operations.

ur primary aim was to produce better milk with c refrigeration. Our plant is giving us tempera- from 12 to 20 degrees colder without ice. It has d us to immediately increase our output, since we ndle 250 quarts more a day than we could when s used, due to quicker chilling.

n hour a day was required in moving ice from the use to the dairy, washing it, and preparing it for Rapid increases in business makes every hour of rking day valuable, and in the time formerly re- each day to move ice and get it ready for use in iry, we can now sell 50 quarts of milk.

. Hescock explained that the primary purpose in ing electric refrigeration was the improvement in ilk. But the dairy has also found marked econo- vhen comparing the cost of operating electric re- ation with ice costs.

f course, when we used ice we were able to get it ch less cost than if we had to buy it. At retail , the ice we used would cost at least $500 a year. lectric current will not amount to more than $135 . It cost that much to put up the ice, and the sav- labor required for handling ice day after day en a big item.

avings over ice will pay for the electric refrigera- quipment in at least two years. And in the mean- we are handling a steadily increasing volume of ss and are satisfying our customers."

⚜

THE WORKER TAKES HOLD.

e growing interest of the worker in the manage- and responsibilities of industry is reflected in a t on Employee Representation or Works Councils by the Department of Manufacture of the Cham- Commerce of the United States.

When the whistle signals the shut down of power, mechanical and human, in a plant," says E. W. llough, manager of the department, in his fore- "it becomes useless until activity is again re- . For it is the well balanced relations of both have given us low cost production on which our nt industrial success rests.

The relations of management with those who guide inery and production is of greater importance than quipment itself and it has been the awakening of mployer and employee to this which has brought esults now mutually enjoyed.

Practically unknown before the World War, there 1,369,078 workers under employee representation United States in 1926—operating under more than orks Councils in about 432 separate companies—a kable growth of a movement in ten years.

⚜

RCHASE OF EVAPORATED MILK FOR THE NAVY.

e navy is calling for bids on 8,000,000 pounds of rated wilk, in multiples of 100,000 pounds, for de- to both east and west coast yards and stations, Schedule 7070, opening June 1, 1927. Bidding s, which include specifications, may be obtained by sted producers upon application to the Bureau of ies and Accounts, Navy Department, Washington.

STATE OF IOWA WINS.

The charitable and penal institutions of Iowa and Michigan were pitted against each other during 1926 in a friendly competition arranged by the boards of control and Iowa came in ahead by showing a milk production of 10,161 pounds per cow on state farms, against a production of 10,081 for every bossy in the pastures of Wolverine institutions.

What pure-bred herds and scientific care can do in milk production is shown by comparison of institutional figures with those for milk cows on farms in general. The average milk production for Iowa cows outside institutions in 1926, was but 4,051 pounds, not half that of institutional herds; while the per cow production in Michigan was 3,918 pounds.

Iowa's best showing was at the Clarinda state hospital where each milk cow averaged 13,526 pounds. Leader in Michigan was the Traverse City state hospital herd with an average of 12,939 pounds. The victory of Iowa is credited to A. McColl, member of the board of control, who has directed the institutional farms and has made them show a profit in every year since the war.

⚜

SHORT COURSES FOR SALESMEN.

More than a score of members of the Salesmen's Club of the Dairy and Ice Cream Machinery and Supplies Association begin at Penn State College, on Aug. 15, the short course for salesmen of dairy products equipment and supplies which the college for the fourth consecutive year is offering, in co-operation with the club.

The course will be presented under the direction of Prof. C. D. Dahle, associate professor of dairy manufacture of the department of dairy husbandry. A number of salesmen will be accompanied by their wives. Convenient living quarters will be utilized at the Center Hills Country Club and at the University Club. The course will be concluded August 27.

Almost immediately following, a course of similar nature, and primarily for salesmen of machinery and supply houses, enrollments for which the salesmen's club has been entering for some time, will begin at the University of Illinois at Urbana.

There, from September 5 to 17 inclusive, an intensive succession of class room, laboratory and work room hours will be spent under the direction of Prof. H. A. Ruehe, head of the department of dairy husbandry.

⚜

WHISTLE AGAIN ACTIVE.

After being silent since early August, 1924, the familiar low, far-reaching tone of the condensery whistle again regularly announces the beginning of a new day, the noon hour and finally the close of another day.

The plant of the Nestles Food Co. was re-opened at Menomonie, Wis., on June 15, and a very satisfactory quantity of milk was received. Prospects are good for receipts to gradually increase until it is believed this plant will become one of the leading plants the company operates in Wisconsin.

W. F. Baily, construction engineer for the Nestles Food Company, supervised the installation of thousands of dollars worth of equipment which had to be replaced, and Axel Thorson, plant engineer, revived the life of dozens of pumps and motors. Many former employees are back on the job.

John Sparks, manager of the manufacturing department of the company, and C. B. Mallory, district manager, have spent considerable time at the factory and are more than pleased with the possibilities of the plant.

SOUTHERN CITY TAKING WELL TO PASTEURIZED MILK.

J. S. Gangstad advises that he purchased a half interest in the Monroe Milk Station, Inc., of Monroe, La. Since taking over the management last April business has progressed beyond anticipation. This growth is remarkable in view of the high water conditions that prevailed in that section for the past two months. A churn and a refrigerating plant will be installed soon, Mr. Gangstad advises and he adds that Monroe is taking well to pasteurized milk and cultured buttermilk.

Mr. Gangstad has had twenty years' experience in the milk and creamery business but feels that there is still a great deal to learn, and for that reason entered his subscription to The Milk Dealer, stating that he "cannot overlook such a valuable magazine when it comes to vital information and keeping abreast with the progress of the industry."

⚜

DAIRY FARMERS ADVISED HOW TO SAVE ICE.

E. R. Gross, agricultural engineer at the New Jersey State College of Agriculture, New Brunswick, N. J., claims that great savings of ice can be made by dairy farmers through the use of cork-filled cooling tanks.

The construction of such a tank is comparatively simple and the additional expense is quickly offset by the saving of ice. When finished, the tank is really three boxes fitting snugly into each other. The outer of concrete, the middle of cork and the inner of concrete.

First a pit of the necessary depth is dug. A three-inch floor of concrete is then laid and over that is placed the corkboard. The sides are then built up of corkboard, leaving space enough between the side of the pit and the cork so that three inches of concrete can be poured to form the outer shell. Thus the cork acts as the inside form. All the corkboard should be painted with tar before it is placed.

To place the inside shell of concrete an inside form is built, leaving a three-inch clearance from the cork. The sides and bottom are then poured. When the concrete sets the tank is finished.

A good tight lid will complete the tank which will save about one-half the ice ordinarily used for milk cooling. Such a lid may be filled with ground cork or a layer of corkboard and should fit snugly on the tank. A strip of felt between the lid and the tank makes an airtight job.

Exceptional strength can be given the tank by placing reinforcing rods in the outside concrete shell at the time of pouring.

DAIRY INDUSTRY SERVICE BEING EXPAN

Greater assistance to dairy farmers to help solv
keting problems in meeting consumer demand is
developed by the bureau of agricultural economics,
Department of Agriculture. Methods are being w
out for making monthly estimates of milk produ
the expansion of market news services, and the co
tion of detailed price and market cost analyses.

The bureau has been trying for many years to d
a method of estimating milk production. Most
material gathered by the latest method tried is s
the raw state, although for a few states some an
have been made which indicate this method will
reasonably accurate indication of the quantity of
produced per cow. It also seems to furnish a bas
making monthly estimates of milk production.

Lack of dependable figures showing changes i
numbers of milk cows in the United States durin
century has resulted in the development of an estim
system which will give figures for "cows and heifer
years old and over, January 1, kept for milk."
mates by the use of this system show that there
about 15,900,000 head of such animals in 1900; 18,6
had in 1910; 21,427,000 head in 1920, and 22,481,000
in 1925.

The figures give increases of 17 per cent in the
1900 to 1910; 14 per cent between 1910 and 192
five per cent between 1920 and 1925. An esti
decrease of one per cent a year in 1925 and 1926
the estimated number January 1, 1927, to only thre
cent above the number January 1, 1920.

Between 1900 and 1925, it is estimated, milk pr
tion per cow increased materially due to the incre
proportion of strictly dairy type cows milked and
proved methods of care and feeding. With p
(1927) cow numbers only three per cent larger th
1920 and population nearly 10 per cent greater, it i
sible that milk production per capita in 1927 will b
than in 1920. There is need for more statistical inf
tion relating to fluid milk and cream, as well as
dairy products for cities where the market rep
service has not been established and where vast q
ties of dairy products are utilized for direct cons
tion.

For a number of years statistical compilations
been made of figures on production, consumption,
national trade and kindred topics relative to the
industry. The general statistical information fur
is now to be enlarged in scope, and the bureau will
detailed price and market price and market cost an
of each of the dairy products involving a conside
of general supply and demand conditions for the
try as a whole, and a detailed study of price beha
important market centers. Response of price to s
will be studied and, if possible, measured; conve
response of supply to price. The influence of dema
price and of price on demand will be studied also.

The present program calls for continued develo
of the service in collecting foreign dairy inform
dairy farm management research, research in fo
competition and prices, co-operative marketing of
products, and standardization and inspection.
spread dissemination of the results of these activit
behalf of the dairy industry, by means of teleg
radio, the press and by mail, is regarded as of grea
portance by the bureau, so that individual farmer
organizations may utilize the information in the co
of their business.

High Bacteria Count?

Here is an easy way to reduce it. Sell farmers and dairymen these two filtering aids. Coupon brings free samples

ONE way to reduce the bacteria in milk is to keep them out of the milk at the start. That is what a J & J Filter Cloth does. Stretched over the pail at milking time, it catches the bacteria-laden dirt particles before the bacteria have a chance to multiply.

Our advertising is teaching farmers and dairymen everywhere to use this precaution—and to use J & J Cotton Discs whenever they put their milk through strainers.

You can profit by this advertising. Sell *your* supply men these two filtering aids. Then watch the grading of your milk. You may be surprised at the improvement!

JOSEPH WILLMANN TRANSLATES INTERESTING BOOK FOR AMERICAN DAIRY INDUSTRY.

After a long, industrious and interesting life, working toward advancement of the American milk industry, Joseph Willmann has turned his efforts toward disseminating some facts, no doubt unknown to many, about pasteurization and pasteurizing equipment of years gone by.

During a visit to Germany he discovered a book, now long out of print, full of illustrations and information about early equipment and experiments in pasteurization. This work he has translated; the illustrations he has had reproduced and all printed and bound into a very attractive book which is being distributed to the leaders of the dairy industry. Those who receive this book will find it a worthy addition to their library of dairy literature, as it is of particular value to one tracing the history of milk pasteurization.

Mr. Willmann first entered the dairy equipment field in this country about 1903, since which time he has invented and introduced a long list of practical machinery for milk dealers and ice cream men. He is, however, no longer interested in the production of dairy equipment. Right now he is spending some time in continental Europe visiting old friends and making notes on dairy conditions in countries to which his travels take him.

He will visit France, Belgium, Holland, Germany and other countries, and while there he will make tentative arrangements for entertaining American delegates to the World's Dairy Congress next year. Mr. Willmann has kindly agreed to act as our representative in Europe in connection with the big tour. He is enthusiastic about it and is spending real money and effort to insure its success.

AN ENTERPRISING CERTIFIED MILK FARM.

Charles Cahill and Son are operating at Cedar Hill Farm in the outskirts of Waltham, Mass., one of the finest certified dairy establishments in New England. Ayrshires comprise the principal part of the herd.

The barns are particularly impressive to the visitors who are always welcome at this show place for certified milk production. Each employee must pass a rigid test of cleanliness and healthfulness before he is hired and allowed to enter the barn. No one is allowed in the barn at milking time except the accredited help who do the milking. All doors are carefully screened and not a fly is seen about the place. The barn is a marvel of cleanliness and light and the stalls are kept immaculately clean at all times. Uniformed helpers move noiselessly about taking care throughout the day that this absolute cleanliness is maintained. The buildings are picturesque and are erected with shingle covering of dark brown color.

In the fine large white residence of the farm, the employees have a real home, the best living advantages and finest cooking.

Mr. Cahill has recently started the manufacture of ice cream and a freezer has been installed. On June 27 the grand opening of the little store on the premises was held with great success upon the opening day. Many motorists from Massachusetts and other states pass this busy location and the future of the enterprising little store, of which the principal commodity sold is ice cream, of the Cedar Hill Farm is assured.

An impressive large white full blooded bull dog, which has captured many a blue ribbon at dog shows, makes a picturesque white guard stationed in the center of the spacious green lawn.

A CORRECTION.

In our June issue we published the address b Webb, Chicago, at the Detroit convention of I tional Association of Milk Dealers, on "Use of Driven Vehicles in Milk Deliveries." In illustrating the article we inadvertently used the wrong cut of the delivery unit. Borden Farm Products Company, with which firm Mr. Webb is connected, have purchased 76 electric trucks of the manufacture herewith illustrated. Thirty of the drop frame type of truck are in service at Ev Ill., and one at their Chester branch, outside Ne City. Thirty-one will soon be in service at the Chicago branch. In addition to the drop frame milk delivery trucks the firm has 14 three and o ton trucks, of the same manufacture, in use for sale milk delivery at their 138th street branch York City.

PARK HOME DAIRY CO.

During the twenty years of existence of the Home Dairy, Elyria, O., their best efforts have bee to give their customers the very best quality of m tainable. As conditions changed, the plant was eled and the company was always in advance of th lic needs.

All herds from which milk is received are under supervision of the research department of the co who work in conjunction with the Elyria board of

Mr. Ingersoll, manager, said: "This company best interests of the health of the public in view times. We at all times anticipate the public nee believe in giving them pure products, of unexcelle ity, delivered by premier service."

The plant is in charge of Henry W. Ingerso and Howard Thompson. A. J. Robson has supe of the delivery system.

FROM ONE HORSE TO HORSELESS WAG

Twenty-five years ago it took Lawrence Bos Chesapeake, W. Va., exactly a day to deliver fro to six cans of milk. Today that amount may be ered in Huntington, to the same customers, in a more than an hour.

A gray mare named "Nell" played the part w now played by a truck.

Mr. Boster was born in Huntington, and is t of the late W. S. Boster, who died in Chesapea years ago. Mr. Boster operated the milk and frui in Chesapeake and called it the W. S. Boster & So Farm. This was sold two years ago to Henry Su Chesapeake. It consists of fifty-four acres.

PASTEURIZED MILK ONLY.

After December 1, 1927, the pasteurization la go into effect in the city of Waltham, Mass.

THE NEW NEIL HOUSE OF COLUMBUS, O.

The new Neil House, Columbus, O., is a palatial structure reflecting a hundred years of progress in the hotel industry dating from the time the first Neil House welcomed the stranger. It is ideally situated in the very heart of Columbus, and opposite the State Capitol. It is accessible to the banking, shopping and theatrical districts of the city. It is located on the national highway, close to interurban and bus connections with many outlying towns. It is situated geographically perfect for the tourist or traveler. Columbus is but 637 miles from New York, 546 miles from Philadelphia, 527 miles from Baltimore and 547 miles from Norfolk and accessible by over-night travel to any of these points.

The Neil House contains 12 stories and basement, an abundance of public room space and 655 rooms for guests.

The attractive, commodious lobby first impresses the guest with the restful atmosphere. Here is the rendezvous for all social and political functions of the city, where guests may lounge and read at leisure or keep in intimate touch with local and political activities.

Off the lobby is the main dining room, a large, natural lighted room, which appeals to those who appreciate artistic surroundings and exquisite appointments while enjoying their meal. The adjoining lounge lends itself as an ante-room to the main dining room where the evening may be concluded in chatting or listening to the music.

Off the mezzanine floor is the comfortable lounge and promenade overlooking the lobby, ladies' retiring room, beauty parlors, desks and accommodations for individual writing and private dining and exhibit rooms. Opening off this floor and enclosed by large glass panelled doors is the beautiful and spacious ballroom with a seating capacity of a thousand people, possible of division to small sections by accordion doors.

The guest rooms all contain an abundance of window light and are very tastefully and comfortably furnished. The guest may have a choice of double or twin beds. A bath, of course, is connected with each room.

The lower level lobby of the Neil House contains the grill room and lunch room, barber shop, men's manicure parlors and ladies' retiring room.

Frederick W. Bergman, general manager of the Neil House, has been prominent in hotel circles for the last 20 years.

Gustav W. Drach, who is president of the Neil House, designed the present Neil House which opened for business August 25, 1925.

Leaders of the dairy industry are invited to make this hotel their headquarters when they are in Columbus.

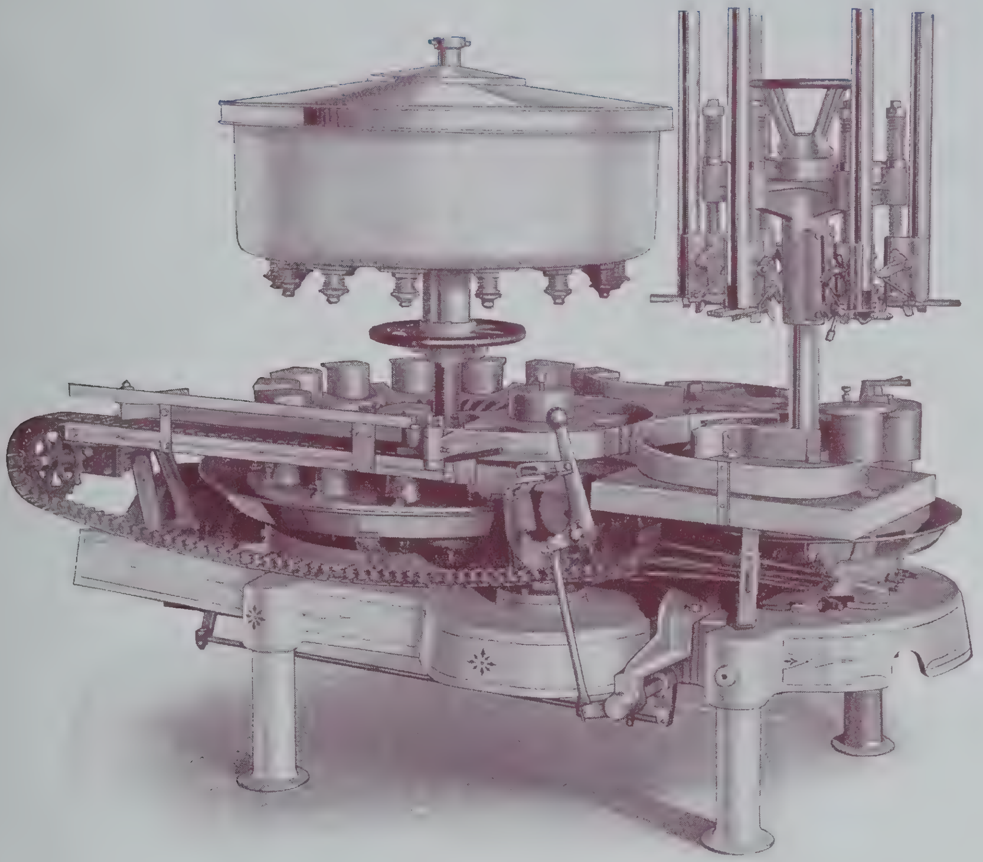
he Davis Rotary Filler and Capper

HAS BEEN IMPROVED!



This is the new No. 5 model, the big dealer's machine. Capacity is 53+ quarts or 66+ pints per minute. Two smaller sizes, Nos. 6 and 7, have capacities of 38 and 24 quarts per minute, respectively.

Why, you ask, when the last model was without a question, the fastest, smoothest and most satisfactory machine of its kind on the market?

Here's the story:

CP Machinery and Equipment always dominates the market because it is years in advance of the rest of the field. So, when our engineers saw that the Davis could be made even better than it was, we told them to go ahead and make it better—regardless of the season, or time, or popularity of the present model.

Among the improvements are: A new, simpler valve which insures filling to just the proper height without adjustments. Design of valve permits use of lighter springs, thereby prolonging life of rubber and mechanism. Conveyor chain is now made of brass. Float valve in tank can be adjusted without touching any part coming in contact with milk. Appearance is improved by lowering tank. Rated capacity is unchanged but tests show that new models are faster than the old.

Of course the all-rotary principle remains unchanged. This feature, which prevents overworking of the machine, spilling of milk and bunching of bottles, is the basic reason for Davis performance.

If you have an old inefficient filler why not replace it with a new Davis now? The saving in labor alone will pay for a new machine in but a short time. Besides you'll have the satisfaction of owning the finest milk bottle filler and capper ever made.

Full particulars and prices upon request.

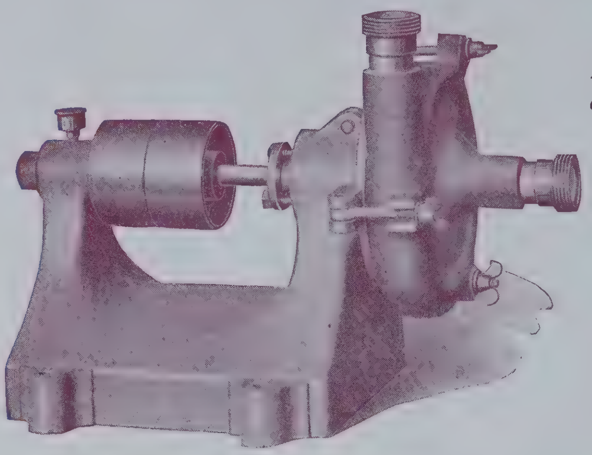
"FOR BETTER MILK HANDLING"



The YORK Milk Pump is made in No. 1, No. 2 and No. 3 sizes and in either belt drive or direct motor drive.

Belt driven pump assembled.

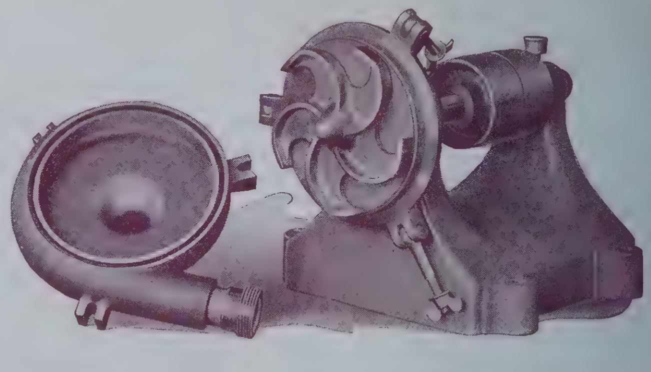
YORK No. 2 Milk Pump

A PUMP which can be cleaned easily and thoroughly is a boon to the dairy. That is what you will find in the YORK No. 2 Milk Pump.

By loosening three thumb nuts, you are able to clean every inch without any guess work. There are no cracks or crevices which are hard to get at.

It has an oilless bearing at the impeller end, and a shaft made of 70% nickel. All castings are brass heavily tinned with pure blocktin. Regularly furnished for 1½ inch sanitary tubing connection. May be had direct connected to motor or belt driven.

The illustration shows the belt driven pump.



Belt driven pump taken apart.
Note easy access for cleaning.

SUPER EIGHT

SUPREME! No milk plant manager can see the Ladewig-Soelch Super Eight without feeling that here indeed is a mechanical masterpiece—a supreme achievement in bottle washing machinery. And no Super Eight owner can help but feel proud of his ownership. For the Super Eight has won its supremacy honestly—through *performance.* The proof of this performance lies in the cost records of many Super Eight owners. Ask them and they will tell you that the Ladewig-Soelch Super Eight washes bottles thoroughly clean, cold, and sterile faster and *cheaper* than it has ever been done before. Let us send you complete information.

Nickel Facts for the Dairyman

This 16-page booklet has just come off the press. It contains information you will want to keep in your permanent file.

THIS HELPFUL BOOKLET WILL TELL YOU—

1. Is nickel satisfactory for contact with all dairy products?
2. Can nickel be easily worked?
3. Can nickel be polished?
4. Does nickel tarnish in service?
5. Is nickel easily kept clean?
6. Does nickel transmit heat well?
7. Are sanitary nickel tubing and fittings available?
8. Does nickel equipment lower bacteria counts?
9. Why nickel is the most all-around satisfactory material for dairy equipment.
10. Are there many nickel installations in service?

THIS BOOKLET FURNISHED FREE TO DAIRYMEN AND MANUFACTURERS OF DAIRY EQUIPMENT.

In other words, this booklet will give you a thorough understanding of why leading manufacturers of dairy equipment have adopted Pure Nickel. It will also tell you why Pure Solid INCO Nickel is specified by those dairies that are famous for the high quality of their products.

Clip the coupon at the top of this page. Send for "Nickel Facts for the Dairyman" today!

VICTOR REFRIGERATION } = *Economy*

STANDARD DOOR

The Victor Standard Cooler Door is recommended wherever there is a necessity to maintain temperature. It is manufactured in all the usual standard sizes. Can readily be set in place, by your own mechanics. Oh, yes! It can be made to order to fit any particular opening that does not happen to be a standard size.

Economy is based upon conservation, so all Victor products are built with the thought of conservation of temperature—paramount.

Victor Standard Refrigeration Products, include doors, chutes, windows, refrigerator fronts, in fact any refrigeration product that will help to conserve temperature, thus lowering the overhead in Ice and Refrigeration plants—and by lowering the overhead increase your profit.

Immediate delivery from stock—on standard sizes

A post-card will bring you complete information and specifications of any of our products. A corps of skilled refrigeration engineers is ready to assist in any project you are contemplating. Address all inquiries to the Hagerstown office.

"This is the most practical method of controlling truck expense I have found in 17 years' study of this problem."

M. L. Pulcher, Pres.
Federal Motor Truck Company

". . . and now ve make this offer, without obligation to any owner of any truck anywhere".— M.L.Pulcher

President

WE will place in the hands of any owner of any truck—anywhere—without charge—the Federal System of Truck Expense Control.

This system can be applied to any plan, method or system now in use without the changing of a single blank or ledger form. It has been presented to—and adopted by—some of the largest business concerns in America.

The Federal System of Truck Expense Control makes dead figures "come alive" and go to work for you. It furnishes you—automatically and daily—the means of exercising over your transportation expenses the same *control* you apply to other departments of your business.

We offer the Federal System of Truck Expense Control to any truck owner as a contribution to an industry in which we have been engaged for the past 17 years. We believe that its use will quickly result in the cutting of hauling costs and in reducing the waste of time, effort and materials.

Send for your Copy

Write for this simple plan and our detailed explanation of its use. It doesn't matter how many trucks you are using or how few—it doesn't matter *what* trucks you are using. Simply fill in and mail the coupon—or just attach it to your letterhead. We will send you the Federal System of Truck Expense Control. Then you can put it to work saving money.

Gentlemen;

We have had quite a large number of your 900 series motors since you started to manufacture them and believe they are a decided improvement over all other motors that we have had any experience with.

Of all the motors we have sent out there have been only two complaints come to the writer's attention, both of which, upon investigation, proved to our satisfaction that the trouble was not the fault of the motor in any way.

It is considerable satisfaction, to the manufacturing department especially, to be able to equip our machines with the 900 series motors and be free from motor complaints. In our opinion they are the most satisfactory motors for our machines of all motors we have tested.

Yours very truly,
J. G. CHERRY COMPANY.

The immense volume of water stored behind Elephant Butte Dam in New Mexico can develop sufficient Hydrostatic Friction to sweep away an entire city.

o Bottle Washing, the Miller Hydro as adapted the greatest physical force nown . . . the terrific friction of Water under Pressure

e greatest achievement in the long history of Bottle ashing—applying this great force, Hydrostatic Fric- n, in a constant and continuous manner that is always pendable. Through self-cleaning nozzles the power- streams of hot alkali solution are forced by high mp pressure into the bottles.

bottles travel neck down through the Miller Hydro y encounter diagonal nozzles, the latest Miller dro improvement, which drive a swirling, scouring, ustic blast straight in under the very edge of the am line and on around the inside clear through to bottom, meeting with a terrific impact every point on the interior surface of each bottle. Dirt and filth cannot resist this positive treatment. Bottles are washed to a degree of cleanliness and sterility far superior to results obtainable with the strongest brush made.

There is value in the Miller Hydro. Its every-day efficiency records have made it the most extensively sold bottle washing machine in the world. It has become standard equipment for both the dairy and beverage industries in every civilized country . . . wherever bottle cleaning perfection is sought after.

No obligation will be involved in requesting further information. We will supply it without delay.

It Does Lots of Things!

THIS 200 gallon CHERRY MIXER AND PASTEURIZER has many uses. Small milk plants use it as a pasteurizer while larger plants use it for handling their certified milk and pasteurizing special milk and cream. It's a good buttermilk machine. Creameries make starter with it. Ice cream plants use it as a batch mixer, for cooling and storage, for remaking milk and cream from unsalted butter, powdered skim or whole milk. Ask us for more details—they're interesting.

Mr. J. V. Jamison, Jr. President,
Jamison Cold Storage Door Company,
Hagerstown, Maryland.

Dear Sir:-

We were using refrigerator doors made by another manufacturer exclusively up to the time that we bought our first door from you. We found your product so much better constructed, the hardware so much more durable at so little difference in price, that we have always bought any doors we need from you ever since our first purchase.

Both your freezer and cooler doors fit the frames perfectly and operate very easily. We know from long experience, that you never sacrifice quality or service for a competitive price.

Yours very truly,
HANFORD PRODUCE COMPANY.
A S Hanford Jr
Vice President.

ASH-EMcL

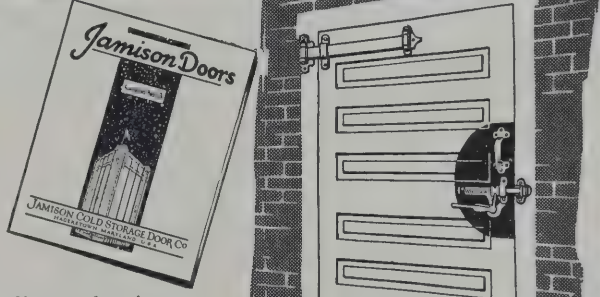
MAYBE you've never used a Jamison Cooler or Freezer Door. Maybe you've never seen one. Maybe you've wondered how all the winning points we claim for them can be true.

But there's no "maybe" about letters like this—and we receive scores more like it constantly. These letters prove that Jamison Doors are better—not because we say that they are, but because we *make* them that way. They prove that Jamison Hardware is the heaviest, strongest, finest obtainable—not because we claim it is, but because it has established its fitness *on the job.*

They prove that Jamison Doors are giving maximum service at minimum expense to thousands of plant owners—not just because we *say* that they are, but because they *are!*

Solid, cold-tight, braced construction . . . Adjustable spring hinges that keep the seal of the door "at par"—and the *only* spring hinges in which *none* of the weight of the door falls on the spring . . . A bounce-proof, self-tightening fastener; the harder you slam it the tighter it grips . . . *Double* seals of contact, between the door and frame.

These are distinctive Jamison features. No other door combines them. That is why *more than half* of the world's Cold Storage Door owners use—*Jamisons.*



If you haven't a copy of our catalog, write for it now. It brings you complete information on Jamison Cooler and Freezer Doors, Refrigerator Fronts . . and those time-savers, ice-savers and money-savers — Noequal Automatic Ice Chutes.

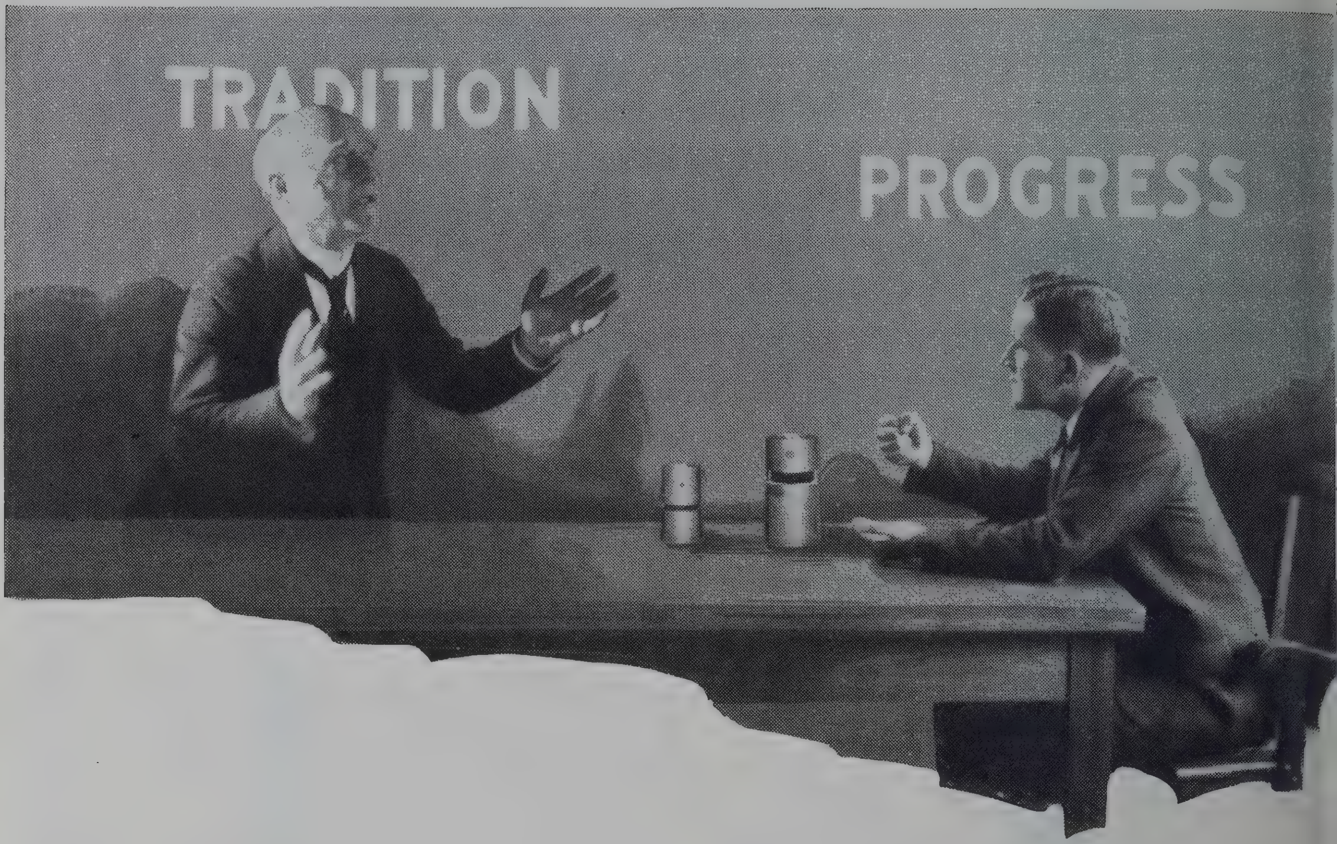
Pop asks how it happened



"Here, Lad—

if you would spend more time looking after the motors that we've got and less time trying to have me get this new-fangled motor the next time I buy—we wouldn't have to be arguing here about the amount of money it costs us to keep motors going. How does it happen that this motor of yours suddenly becomes a world beater?"

"Easy, Pop—

it didn't happen. The best things ***neve*** happen—they're achieved.

The "Linc-Weld" people didn't happen o bearings and shafts that are bigger than thos of any other motor.

Being motor specialists they knew years ag that these items cause the most trouble i motor operation—so they deliberately developed these to a point where these trouble were licked.

By accurate logging of our motor shutdown 75% were directly the result of bearing failur

So I'm simply asking you, Pop, to look a these two bearings—

The little fellow is ours—the big brute is th "Linc-Weld," and tell me which you'd choos if your life and not your prejudices wer at stake on the final outcome in service?"

The correct bottle washer for every sized plant

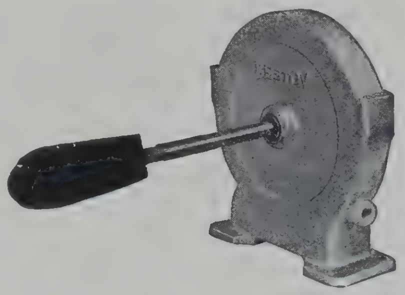
Clean Bottles! How much depends on them? How many customers are needlessly lost through the lack of them?

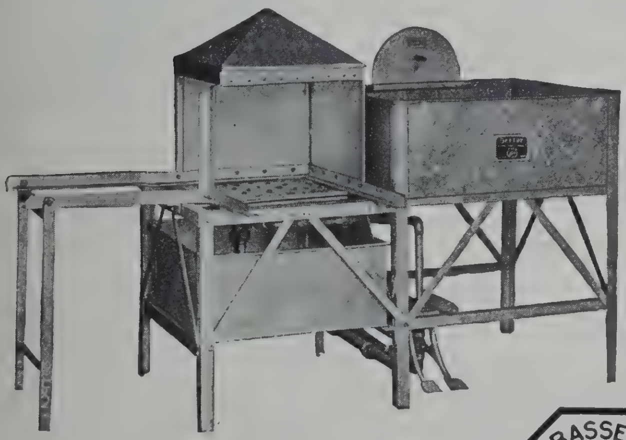
Cherry-Bassett has made a complete study of the bottle washing requirements of the dairy industry, and as a result offers you bottle washing equipment with a name and reputation, backed to the limit by us.

Whether your requirements be 50 or 50,000 bottles a day it will pay you to get our complete literature on your size washer, study it carefully, convince yourself of its excellent qualities and then let us fill your washing requirements to perfection.

Your name and address together with your plant capacity will bring this literature very promptly.

Bestov Brush Washers are made in various sizes and styles—direct motor, steam turbine and belt drive. No matter what the working conditions in your plant might be you will find a Bestov Brush Washer to satisfactorily fill your requirements. The model shown is the Bestov Steam Turbine Single Brush—a very popular washer among the smaller plants.





The Bestov Junior Bottle Washer is ideal for plants washing not more than 600 bottles a day. One man can do the job very efficiently and thoroughly. Although a low priced outfit the Quaker City Junior washes bottles just as clean and sterilizes them just as well as the much larger washers. A very popular piece of equipment among the medium sized plants.

OHMER

The printed record inside the regist shown at the top. Below are the tic Note how the figures on the tape an the tickets agree.

THERE'S nothing like the OHMER No. 79 Ticket-Printing Register for keeping account of milk received at dairies and creameries. It's the most convenient, quickest, and surest method ever devised.

Your receiving department weighs in a delivery. The weighman sets the levers on the OHMER Register and turns the crank. Two things instantly happen. A receipt is issued and a duplicate record is printed on tape locked in the register.

Receipt and Record Show Every Detail

The receipt is completely printed by the register. It shows the name of your company, the date, the weight, the account number, the kind of product, and the consecutive number of the transaction. This receipt can be handed to the driver at the time or mailed to the producer later.

And all the items shown on the receipt are printed from the same type on the locked-in record. There can't be any discrepancies or changes. No memorandum can be lost, blurred, or mutilated. No errors can occur from illegible figures.

Office detail is greatly simplified by the use of the No. 79 OHMER Ticket-Printing Register and the system of operation that we recommend with it. From the time the milk is weighed to the time you send the checks in payment, all pencil writing and all copying of any kind is entirely eliminated. Think of the time and trouble saved.

See how the register in the receiving room is out of the way, yet convenient for instant use.

Compact and Simple

When you see the OHMER Ticket-Printing Register, you will be amazed at its compactness and simplicity. Only the knowledge gained from 29 years' experience in making precision recording devices, only the specially designed equipment for fine and accurate work have made this register possible.

And the cost is so little that the saving of time and the prevention of losses will pay for the register over and over again in a single year.

Get Complete Information NOW

While the matter is fresh in your mind—right now—inquire for complete information. We'll send you fully descriptive literature with samples of receipts and records. Learn how the OHMER Register will save time and money for you. Learn how it will foster good-will among your customers. Write or wire today.

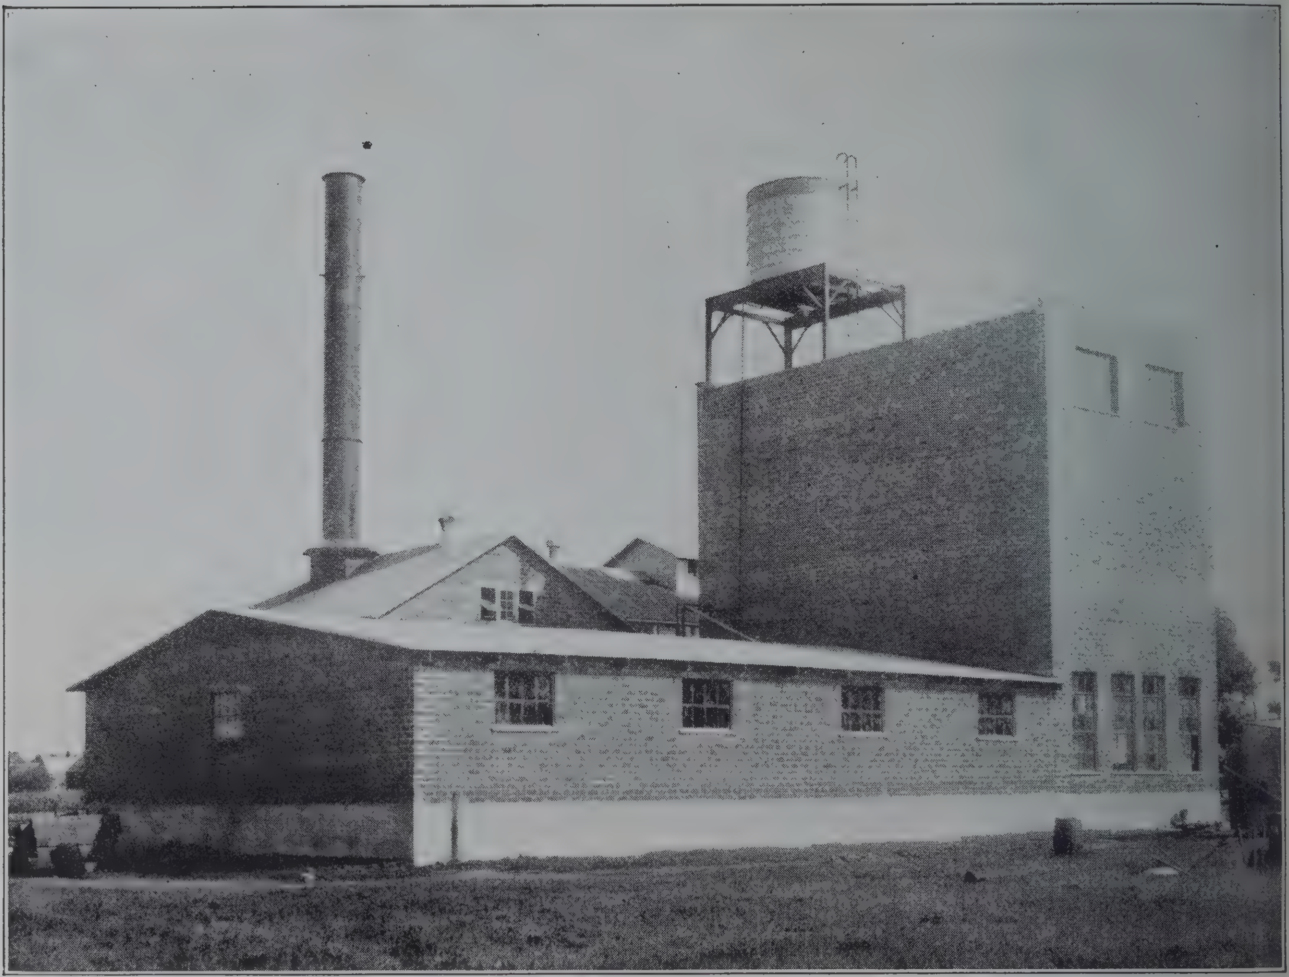
DOUTHITT MILK POWDER PLANT

GRAY-JENSEN SPRAY PROCESS

Designed and Built by

DOUTHITT ENGINEERING COMPANY

100 WEST MONROE STREET, CHICAGO



Sheffield Farms Company's plant at Lisbon, N. Y.

Add to your creamery profits by manufacturing your skim milk, buttermilk, or whey into powder on the Gray-Jensen Spray Process Milk Powder Plant.

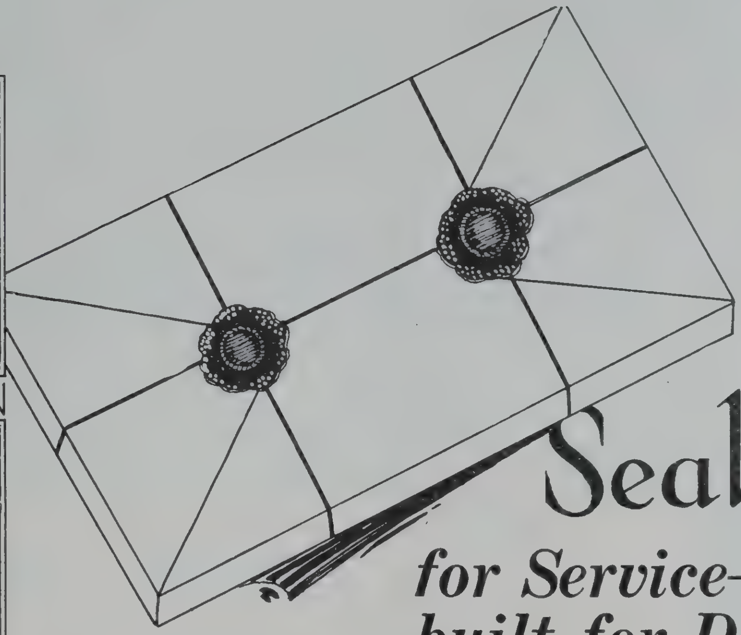
The highly developed efficiency of the Gray-Jensen process results in recovery of milk powder actually equivalent to the solids in the milk, with lower labor, fuel and power costs than are possible with any other type of milk powder plant. These savings alone pay for one of our plants in from one to three years. Operating records prove this.

We can furnish an assured market for all skim milk and buttermilk powder made on our plants.

These plants are built in sizes to handle from 10,000 to 120,000 pounds of normal liquid milk or milk products daily.

Write today for booklet describing the Gray-Jensen Spray Process Milk Powder Plant

When writing to DOUTHITT ENGINEERING COMPANY *please mention The Milk Dealer.*



Non-corrosive bearings of special design. Cast of non-corrosive alloy. They cannot freeze, and always operate.

RESIST · CORROSION

Stands up under flushing and steaming. You can't harm the bearings, you can't force moisture into any part where it will be harmful.

EASILY · CLEANED

Moisture can't get in. Lamson Rollers extra heavy throughout, have heads welded in. No joint through which moisture can enter.

MOISTURE · PROOF

Special guard rail over roller ends. Prevents can chimes from dropping off and blocking the conveyors. Saves both cans and rolls from wear.

SAVES · · · · WEAR

Sealed

for Service—built for Dairies

Sealed for service....built for dairies....made to last longer. That is the story of Lamson Sanitary Gravity Roller Conveyors.

A special bronze (non-roller) bearing that defies lactic acid ....sealed rolls that invite steam and water drenchings.... with a rigidity of construction that guarantees long life, Lamson Sanitary Gravity is specified in hundreds of dairies all over North America.

No ball-bearings to rust and dust away. Dead rolls are almost unknown, as these special bronze (non-roller) bearings guarantee that the rolls will always roll. The sturdy construction guarantees longer life and a more useful life.

Lamson Sanitary Gravity Conveyors have become the ideal of the entire gravity family. Because it is built to last longer. Learn about this new gravity conveyor, built to overcome your difficulties....to cope with your problems. Attach your letterhead to a portion of this page. That will bring additional information.

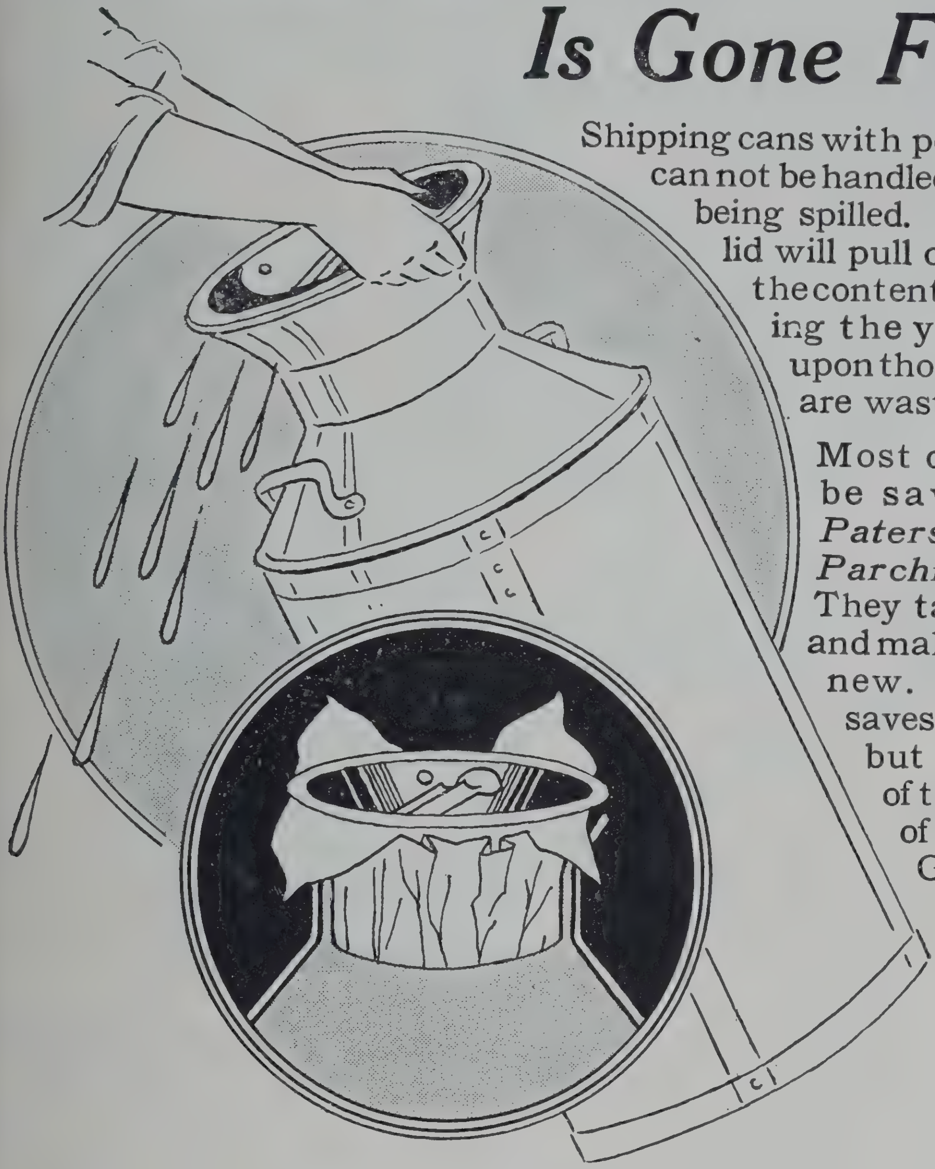
Cream Lost Here—
Is Gone Forever



Shipping cans with poorly fitting lids can not be handled without cream being spilled. Frequently a lid will pull out and most of the contents are lost. During the year thousands upon thousands of dollars are wasted.

Most of this loss can be saved by using *Paterson Vegetable Parchment Gaskets.* They take up the slack and make all lids fit like new. This not only saves milk and cream but prolongs the life of the can. The cost of the Parchment Gasket is nothing compared to what it saves. That's why millions are used every year.

Special Offer

Send us One Dollar in coin, stamps, check or Money Order and we will send you, Postage paid, 250 Parchment Milk Can Gaskets made from heavy fifty pound stock cut to standard size 11″ x 11″. If you are not satisfied that their constant use will save you money, the amount you paid us will be cheerfully refunded.

The Paterson Parchment Paper Co.

Chicago San Francisco

Passaic :-: New Jersey

You can save money, too!

You may handle only a few cans a day, or week, or you may handle hundreds. But in either case Parchment Gaskets will save many times their cost. Fill out the coupon below and send for the free samples and instructions how to use them.

THE PATERSON PARCHMENT PAPER CO.

Sealed tightly

....yet easy to remov

The Westlake One Piece Seal fulfills both essential conditions of the ideal milk bottle cap:

1. It affords complete protection to the contents of the bottle. The five ply spruce paper disc, softened under heat in the Lakewest Automatic Milk Bottle Sealing machine, is moulded over the *entire* top of the bottle by crimping fingers. These fingers hold the seal in place until it cools and hardens. The seal then grips the *under* portion of the lip of the bottle. Result, a tight seal that cannot accidentally be knocked off.
2. But when the housewife wants to remove the seal, it may be taken off in a jiffy, *without the aid of any additional appliances whatsoever.* A simple lifting of the edge of the seal to open the crimping, and off comes the whole seal. It cannot be used again as a tight seal, but makes an excellent dust-cover.

Wherever the Westlake Seal has been used, both dairymen and consumers report unqualified satisfaction. May we send you a copy of the new bulletin, "The Scientific Combination"?

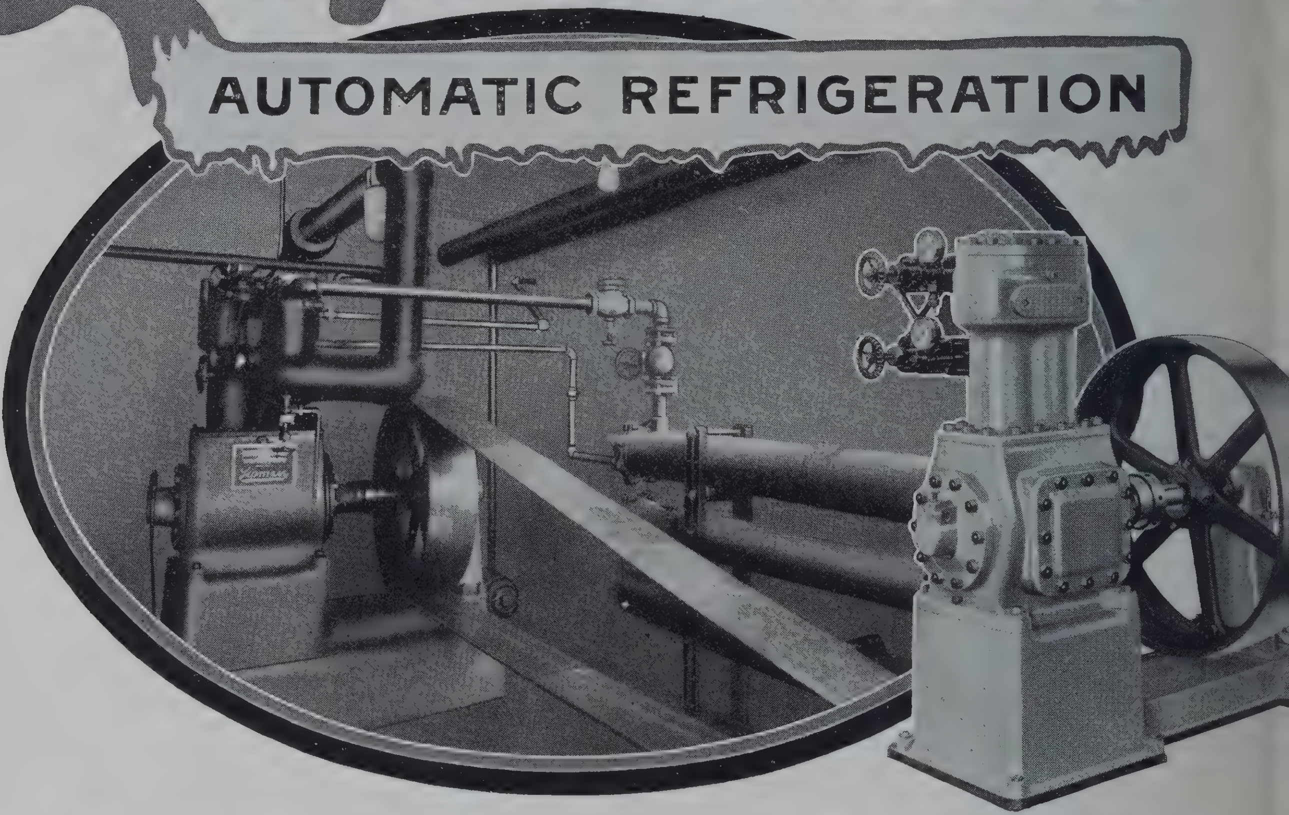
AUTOMATIC REFRIGERATION



"Same as our Salt Bill"

The Martin Dairy Company, of Little Rock, Arkansas, writes that "the operating cost of our entire plant, which includes one 30 H. P. motor on compressor, one 10 H. P. on marginizer, one 7½ H. P. on milking machine, one 2 H. P. on pasteurizer, one 2 H. P. on ice crusher, one 2 H. P. on well pump, one 1 H. P. on brine circulation and one 1 H. P. on water cooling tower, is approximately the same as our salt bill when using the old ice and salt methods.

"This machine operates automatically and is giving us entire satisfaction."

Milk dealers are invited to write for our folder on refrigeration for dairies. Sent Free on request.

The Martin Dairy is refrigerated by one of our Model 3000 machines, the compressor of which is shown above. This Model has proven well-adapted to dairy refrigeration as it is very economical to operate, very rugged and dependable, and seldom needs attention. Controlled either by thermostat or by hand.

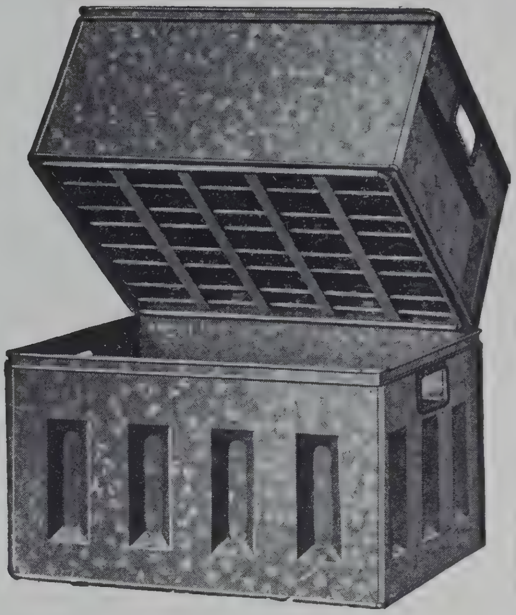
STRONG

Without Excess Weight



CLIPPER CASES

(ALL STEEL)

No excess weight is added to Clipper Cases by the customary metal reinforcement. The whole case is made of steel.

In proportion to its strength there is no lighter case made and none are stronger.

Their Weight is Permanently Fixed

There is no added weight through repeated soaking and washing. Neither is there the deteriorating effect of splitting, warping or loosening of joints.

Every joint of a Clipper Case is welded or lock seamed. The bottle partitions are securely fastened and the finished case is finally given a heavy coat of galvanizing to prevent rust.

When you buy Clipper Cases you buy Permanent Equipment. You buy an asset instead of incurring expense.

A Small Lot Will Prove It. Send for a Trial Shipment Now!

The Faultless

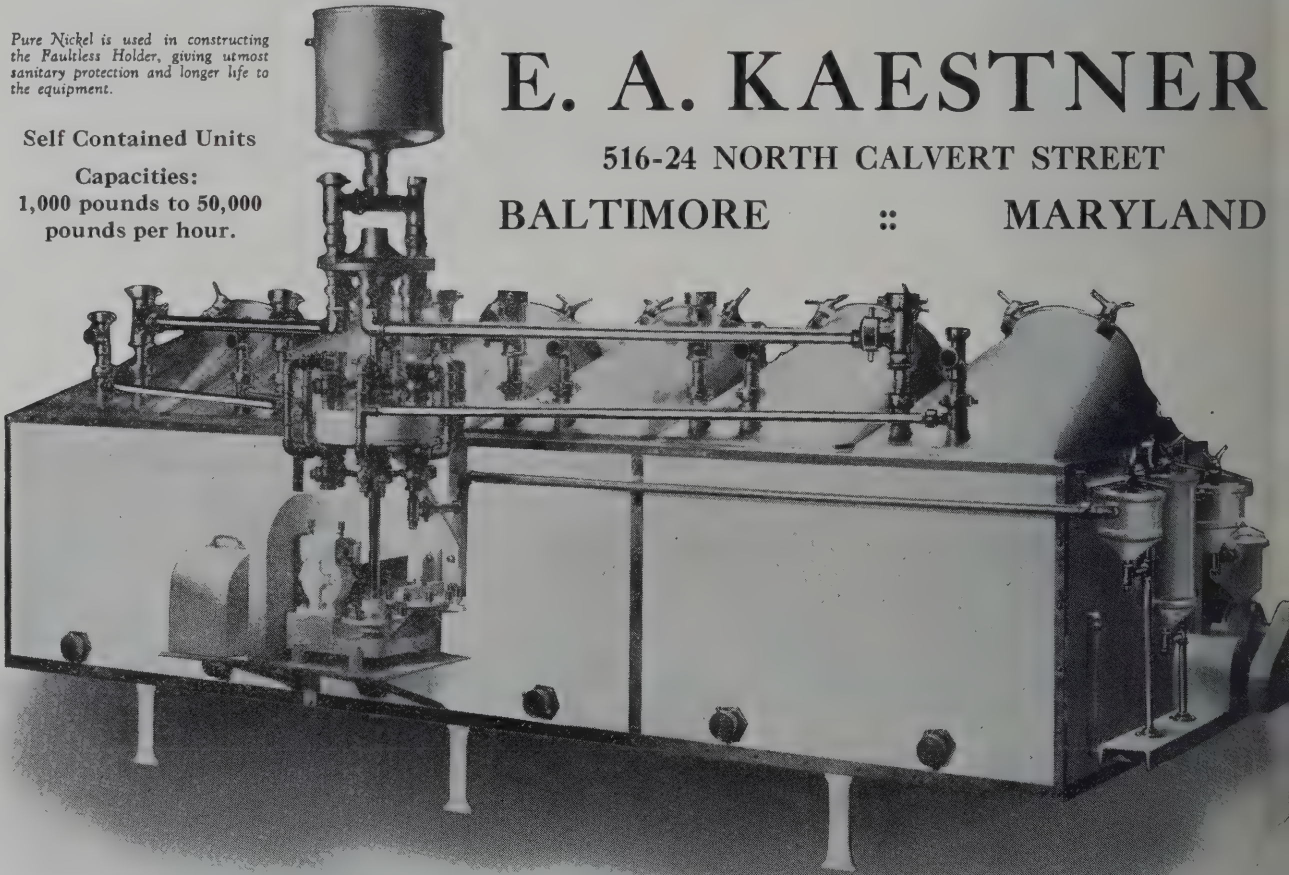
Nothing Left to Chance

Positive
Automatic
Valveless
HOLDER

All operations are automatically controlled. ℭ Every valve is accurately timed and positively functions at the right time. ℭ The holding period cannot vary and ample, high quality insulation maintains correct temperatures throughout the holding period.

How the Faultless Holder does these things is fully explained in our illustrated circulars.

WRITE FOR THEM



Pure Nickel is used in constructing the Faultless Holder, giving utmost sanitary protection and longer life to the equipment.

Self Contained Units

Capacities:
1,000 pounds to 50,000 pounds per hour.

LEADERS in the INDUSTRY

THE superior performance of the Yundt Air Brush Milk Bottle Washer has won for it the leadership in the bottle cleaning machine field.

Leading dairies have installed the Yundt Air Brush Milk Bottle Washer because of its quality and dependable performance.

A steady flow of clean, sterile, polished bottles are delivered from the Yundt Air Brush Milk Bottle Washer.

You, too, can secure clean, sterile bottles by installing a Yundt Air Brush Milk Bottle Washer.

Descriptive literature is yours for the asking.

Dairy Products Association of Kentucky, Inc.

AUGUST, 1927

BULLETIN *of* EVENTS

Dairy Industries Exposition—The second annual exposition of the Dairy and Ice Cream Machinery and Supplies Association will be held at Cleveland, Ohio, on October 24-29, inclusive. Roberts Everett, 225 West 34th St., New York City, secretary and manager.

International Association of Milk Dealers—Twentieth annual convention to be held in Columbus, O., on October 19, 20, 21 and 22, 1927. The Neil House will be convention headquarters. Secretary, R. E. Little, 228 No. La Salle St., Chicago.

Pacific Slope Dairy Show—Seventh annual exposition to be held from November 14 to 19, 1927, at Oakland, Calif. Secretary-manager, Robert E. Jones, 1404 Franklin St., Oakland, Calif.

Ohio Milk Distributors' Association—Annual convention to be held in connection with the convention of the Ohio Association of Ice Cream Manufacturers and the Ohio Association of Creamery Owners and Managers, at Toledo, on January 24 and 25, 1928. Commodore Perry Hotel will be convention headquarters. Secretary, W. A. Wentworth, 5 East Long St., Columbus.

"IT'S a selling job—this milk business." That's what a prominent milk dealer told us some time ago, and he said it with the fervor of a new convert. He is right, of course. But it seems to be one of the most difficult tasks imaginable to persuade some members of the industry that they are face to face with a merchandising proposition.

People used to run milk plants—like people used to "keep cows." A customer came and bought milk. Then competition. Then the customer wanted his milk brought to him. Now it is necessary to do something more—to show him why he should buy more milk than he now is using.

You may confine yourself to running a milk plant. You may build up the best organization, the best plant systems in the universe. Some of the national business magazines may come around from time to time and write you up—your system, etc.

But that isn't selling milk. Years ago people used to keep store like people kept cows. They kept the store well, too. They kept it clean, well swept out, v dusted. They kept anybody from running off with a thing. But they didn't know much about merchan ing. Didn't have to. Folks just came and bought th goods. But nobody is coming around to the milk pl to buy milk these days. Neither are they coming to stores—of their own original accord. They are be brought into the stores by merchandising material, vertising, direct-by-mail sales talks, printed card selling stuff.

That's the same condition we face in the industry.

It's a selling job.

⁂

THERE was a time when a city milk campaign a live item of news and The Milk Dealer told a it in detail. Now we get so many reports of city advertising campaigns that we take them as a ma of course. They have come to be an established fea of the city milk distributing business.

The fact that they are growing more popular is haps the best evidence that they pay. They not pay the individuals who put them on, but they also in a larger way. They increase the consumption of products and thus benefit humanity. The city dealer who spends his money to increase his sale serves to be recompensed by a more profitable busi

Say, men—you who are supplying folks with wonderful food—do you even get so busy with many problems of business that you don't find tin think about the service you are rendering humanity you sell pure, wholesome milk? It's easier to kee standard high when you have the thought of SER in mind.

These milk advertising campaigns help to keep thought in mind. We really believe that they enco better methods, along with increased sales. They to pep up the whole organization.

There are many agencies back of this general ment to encourage a larger consumption of milk. of them are of a private nature. Men of unusua perience and ability contract with individual milk ers to study their organizations and to build up efficiency. Such men are in a high calling and pe a real service to their clients and to humanity. improve the quality of the product, as a rule, be improvement in quality is often necessary to incr sales efficiency.

Often the milk dealers of a city band together t on an advertising campaign. They generally invit co-operation of the state dairy council or its paren National Dairy Council. These campaigns are a successful. They increase sales of milk and are su ful because they do. They stimulate interest in m a food and educate the consumers to better appr its worth. Whether promoted by the individual or wise we are heartily in favor of the advertising paigns being put on all over the country to increa uses of milk. They are a good thing for the dai dustry.

R years the general trend in the city milk business as been in the direction of fewer dealers and a r business for the ones who stay in business. We always argued that this is a natural development e business and results in benefit for the producer, lealer and the consumer of milk. This development, ever, has been confined largely to the East, West North. With few and shining exceptions, it does old true in the South, where the milk supply of the s and cities still largely comes from many small rs. Of course the purity and wholesomeness of the ly suffers in consequence.

Vith increased volume the milk distributor is en- l to use expensive equipment, and methods which ould not use if he were handling a small volume. believe in increased volume for the city milk dis- tor to such a degree that we believe his business show an increase in volume each year or it is in a erous position. Most any business grows in volume importance from year to year, or it goes the other It is seldom that a business remains at a stand- The only safe course for the business man is to every effort to increase his volume.

Ve believe it is a laudable effort when the milk r uses every opportunity to increase volume, to his business grow in spite of the danger of having business called a "milk trust" by some "clatter- ed" newspaper man.

ncreased volume, however, must never be gained at xpense of quality and service. It is a short-sighted y to sacrifice any of the fundamentals of success in to gain temporary increase in business. The man e firm who has built up a reputation for integrity, in the conduct of the business and in the product, ll afford to adopt any measures to increase volume s such measures will protect that reputation. In words, increase in volume is only desirable when procured on the right basis. Some men in business o greedy to increase volume that they are willing so at no profit, or even at a loss. They live in s that something will happen in the future to en- them to make some money on the increased volume. times something does happen, but it isn't usually they are hoping for.

* * *

ANY city milk dealers are finding it practical and profitable to sell eggs to the consumer along with products. Where the man on the route has all the ess he can handle it would probably be unwise to him down with additional work, but on most routes can be added without increasing delivery expenses much. When this can be done it is profitable to do roviding the dealer can give the same good service his customers are accustomed to.

ome men are not as busy on their routes as they r to be. That is a failing not peculiar, however, em. It is a trait peculiar to most men. They can busy whether loaded to capacity or not. When ng for means to increase sales on your routes it may pay you to consider adding eggs if you are not already handling them.

* * *

IT'S an old story and we have repeated it several times, but we want to again emphasize the importance of forever keeping in mind that you as a distributor of milk are selling more than milk. Each bottle of milk you sell represents a service and an investment that suits the customer's convenience and protects the health of his family.

People who complain about the price of milk do not appreciate the true value of the service they are getting. If they understood its real importance to them they wouldn't kick. They can't be blamed for kicking if they are not made to appreciate the value of that service.

Generally when a milk dealer gets such a complaint he tries to excuse his price by emphasizing the food value of milk or by telling about the expenses of handling milk. Even though the customer is convinced that the milk dealer is blameless he still condemns the system. He looks upon his particular milk dealer as an apology.

Our modern system of handling milk should not carry such a blame. It needs no apology. It is operated in the interest of the milk consumer. He should understand these facts. It is the milk dealer's fault if he doesn't understand them. At least it is a lost opportunity for the dealer. Many milk dealers find their hardest competition with peddlers of raw milk. Many consumers are satisfied with far less service than the legitimate milk dealer offers. They are satisfied because they don't know any better.

When they are finally induced to patronize the modern milk plant they must understand the value of the service they are getting or they will not be satisfied. They will look at nothing but price, and who can blame them? These consumers must be told the story of service. It is an easy story to tell and one easily understood. Your fine plant, your modern machinery, your delivery equipment, and other visible evidences connected with your business, testify to the service you are giving. These things should be used not in apology for the price of your milk, but as arguments for the better service you are giving the public.

* * *

IT'S going to be a long time before legislation will replace human initiative and honest endeavor in bringing about improvement in dairying conditions in this country. Some people seem to think that if we could just have a state or federal law to govern every act that our dreams of perfection would be realized. Every time a new problem presents itself, or an old one bobs up again, they think of rushing to the state legislature or to congress and asking for a new law to solve that problem.

Some dairy problems have been solved by legislation, but far more have been solved by honest, earnest effort on the part of men in the business. We need more of the same kind of effort today, and it will do more to promote the best interests of dairying than will more dairy laws.

The Streets of Forgotten Mil
Merchants

By A Staff Writer

A Story of Men Who I
Not Sell Milk—And W

I KNOW this story takes the wrong slant. All of us argue that the negative side of a matter should never be featured, either in advertising, direct selling, or in any way. Yet this article wants to discuss the negative side of milk salesmanship, and it necessarily must be a negative article, for it is a series of negative stories about negative men who overlooked their sales opportunities.

Labor turnover, you most certainly know, is one of industry's greatest problems, and it is to be wondered if we in the milk industry have not been grievously at fault in not considering this fact in our handling of drivers.

This is not to argue that a man who shows clearly from the outset he has no ability is to be bothered with, but the milk plant operator will do well to weigh the matter carefully before issuing the discharge order.

There is a training period in milk salesmanship just as in other lines of industry—only it is decidedly truer of this than others.

Few milk dealers give much thought to this. Indeed, how sadly true it is that the milk dealer so often hires drivers instead of salesmen and then becomes disgruntled because they are not selling!

How true it is that the route foreman so often is just that—a route foreman—directing drivers, training drivers, when all the time these men should be receiving the highly finished ground work of milk salesmanship!

Why don't they make good?

The milk dealer does not ask himself that question often enough. They come and go and he wrings his hands and says, "My gosh, what a business, a gang of tramps here today and gone tomorrow!"

Here and there in the milk industry dealers are beginning to question the wisdom of turnover in labor. It is an all-round problem, not only in milk salesmen, but also in other operatives about a milk plant, for this is a highly specialized business, and the dealer has quite an investment in every man and woman that comes into his plant for any length of time. That money is gone —vamoosed, passed out the way of the dodo and milady's bustle. Just like putting money into a big black hole.

In the first place, we are discovering in the milk industry, it is necessary to be careful—be careful—very, very careful!

Many life insurance companies make the most exacting requirements of the caliber of men they hire.

Many large firms of various industries go to great trouble to get a size-up of their men before they put them on the payroll. They want to know he is the sort of man they want. Otherwise they are taking up their time needlessly.

This is a serious business, this business of entrusting a man on a route to dispense the greatest food product in the world. This man has an intimate contact with the health and well-being of a large number of human creatures. He must be reliable—dependable.

In those two words you have just about expressed
what a milk merchandiser expects of good route me
reliability and dependability. Of course, to be succ
ful merchandisers they must have a certain amount
initiative, a certain use of speech, and a certain pleas
address—approach.

But just as the newspaper demands of its repor
accuracy above all else, a man can have all the quali
of a merchandiser and still fall down on a milk rout
he is not reliable.

Looking over the situation with the sales manage
a certain milk company just the other day we fel
talking about the men who didn't make good, the
who came and stayed awhile and used up somebo
time, drove away a few customers and then got the g

"It's awful," the fellow bemoaned. "Milk pla
today are keeping cost records. They are watching c
and depreciation very carefully. They are at the p
where they can tell you how much more they are go
to get out of this machine, and what the hourly op
tion of this apparatus will cost.

"But we have simply fallen down on the human s
We haven't devised any way to appreciate and de
ciate our human machine. For instance, we haven't
idea of what it costs us to take a chance with a dr
who never was cut out for selling milk. We d
figure on how much money that fellow costs us,
much of a risk he is in training, how many chances
are taking on his not being the right man, how poss
it is that he will undo a great deal of selling mission
work we already have accomplished."

He entered into silent reflection for a moment
then continued:

"By George, it's simply alarming every time I
into the matter. I can't possibly keep in mind how m
we have had this year. We—"

"Why don't you keep a record on these—"

"But we have done that very thing," the sales m
ager broke in, as though diving for the thought. "J
a few months ago I started it. Of course, with
thought of the man dismissed, but from our viewpo
Here it is"—pointing to a card index—"all down
black and white. We begin here with the name
George Abt and go right on through the alphabet
Adolph Zilkus.

"Now, here's a boy here—22, high school educat
good appearance, pleasing address. This boy failed
make good"—he peered closely at the card—"beca
he was impolite. Shows a man may have a pleasing
pearance and at the same time not have good mann
doesn't it?

"All right, it works the other way around ag
Here's this lad Johnson. His card is marked 'supe
advantages.' He was a college man. Thirty-two ye
old. This fellow had what we call background—rese
every earmark of a gentleman. In fact, seemed to be
of his sphere. Possibly he was. Maybe we were foo
in taking on a man of that type. Here's why he di
stick—'grouchy with customers, many complaints.'

The sales manager sighed. "A man may hav ant way about him. He may have even that thing ll personality for want of a more descriptive word. ay show all the elegant earmarks of a gentleman eeding and family background. Then, at the same he may have, smouldering down within himself, oroughly rotten disposition. It will show under but—"

gain the sales manager halted, and he drew a long h.

That's the h— of it," he continued. "We can't em under fire until after they are hired and out on oute. A man looking for a job is not in natural se. He's on his best behavior. He puts forth a ng front, the eager, earnest front that typifies the w looking for a job. How the dickens can we rate n when he's on parade? The colonel of a regiment d never pick his best soldiers just by seeing them on drill grounds.

That's the rub in the milk industry. What are eager, earnest lads going to do under fire? We tell a dern thing about it here in— What's that? acter study, you say? Need practice in studying acter in the face?"

he sales manager's face broke into a wide grin, and he laughed heartily.

I used to believe in that," he said. "But it was e I had handled salesmen long. I know it makes reading, and you boys who write those cute little zine articles like to play that old ghost, don't you? , son, there's no such animal. You take it from me there's no man west of Boston and north of Key who can look any man in the face and tell whether as character, courage, stamina, whether he'll talk to the boss, fuss with customers, hump against when's he's delivering the milk, drop the crate is foot and cuss loud enough to wake up the whole hould, get drunk and fail to show up for his route morning.

Oh, yes, we do have them to get drunk—just once. ourse, there's a way to get a fair idea of the sort of w you are dealing with—there are types, you know. e's the good natured, easy-going type. Then there's low, plodding type, not so good natured, but deadly rnest. I have rather a weakness for that sort of w on a milk route, for Heaven knows it takes stick- veness. I'd like to mix in a little good nature it, but we have little to do with the human alchemy llow creatures. You can draw 'em out and that , and I'm frank to say we milk people have failed very largely, including the present speaker. That's t, boy—an art!

Frankly, I like best of all, if he were the practic- kind, the fire-eating fellow, the chap whose very is on fire to get action, to drive, to do something, t somewhere, to do something.

I'm frank to say there's where I've been bit er. These fine, highstrung, quivering young thor- breds, have a heck of a time in the milk business. can't settle down to the grind, it seems. They take their call-downs—I call it taking it on the for we men selling milk have to take our blows on hin just like the pugilist. And right there is where milk merchandising comes in—being able to stand aff and come back fighting—fighting with a smile.

Somebody once said the strongest nation in the l is the nation with the most men who can take a of a lot and then come back for more. He spoke uthful for the milk industry—and I don't mean ps. For this game calls for standing up all the no matter how rough the going is, and being able le the tide.

"The milk salesman meets his people at the very worst time of the day, when human beings are not normal. It really isn't fair, you know. Not a bit. I'd hate like the dickens to have to go through what my men do, and by the way, I'll tell you a little story about that experience some time when you have the time to listen. I tried it.

"But I'm talking about the boys who don't make good.

"Stonewall Jackson said that success in warfare depends upon being where you are not expected. The reverse is true in the milk business; the driver must be where he is expected to be, and right on schedule, all the time, day after day, hippy-to-hop, never failing.

"Nathan Forrest said the secret of winning battles was to get there first with the most men. Now we come to a parallel between war and milk merchandising—the man who develops his route best is the fellow who gets there, who is on the job, the one who is ready to hear the call of a disappointed housewife whose milk man has fallen down on her. Her regular driver may be asleep at the switch. He may be late. But the fact is, she wants milk, and the boy who gets there first is the one who is going to sell that lady milk while she is in that mood—and may have her for a lifelong customer if he can always deliver the goods.

"You speak of milk merchandising—you fellows who write those magazine articles—as though the whole thing was summed up in getting more customers. Not by a long shot. Of course, we expect our men to be on the lookout for all the new customers they can get. Not necessarily some competitor's customers, though we are not above taking what we can. But also some customers who never before bought any milk to speak of. But, of course, we have a merchandising system that is operating right here from headquarters, and the driver must fit into that system. We develop new business here. Then it's up to the driver to hold that business—hold that business, I say!

"Man, I preach that more fervently than the Yale boys cry out for their football team to hold that Harvard line. Holding business is the big thing in selling milk. Think of it. We have more business now than we ever had. We are taking on new business at the rate of about 50 quarts a month. That 50 quarts is important, but not nearly as important as the volume we already have.

"We have had drivers to fall down on that very score. The over-eager lad wants to make a showing. He has his ears laid back, keen on the scent of a new customer. He overlooks some dear old soul who has been buying her milk from us since she had her first beau. We stand a good chance to lose her. And doubtless she is worth two or three new ones.

"Hold that business! That's the sermon I always preach.

"Well, it's getting sort of late now, brother, but some of these days when I feel like talking, I'll tell you about some of the few things I have learned about the business of milk merchandising—about the boys who look good in the office, signing an application blank, but just don't have the nerve to stand up under fire. Man alive, that's the real big problem in the milk industry, to find out how to look a fellow over and see what sort of flame he has in his soul, whether he can stand up and keep up the fight after the guns are trained on him for six months or not.

"Come around again some time, brother, when you are not busy, and we'll have a real chat about this milk merchandising stuff that so many people are shooting at the wind about."

Building Milk Sales by Selling Good Cottage Cheese

A Milwaukee Milk Company Attributes Increased Sales of All Milk Products to Their Efficient Sales Efforts to Popularize Cottage Cheese. The Trapp Brothers' Dairy Service Plan

By P. W. KOEPPEN

FEW dairies look on the humble cottage cheese as anything except a sideline—and a not especially profitable sideline at that. But the Trapp Brothers' Dairy of Milwaukee has featured its creamed cottage cheese and as a result has given its milk business a big boost.

Under the descriptive name of Kre-Melo cheese, Trapp Brothers are supplying a large number of dealers in Milwaukee county with cottage cheese. In fact more than 900 dealers sell Trapp Brothers' cheese—double the number who are now selling Trapp Brothers' milk.

But Kre-Melo cheese is the entering wedge. It is such a popular cheese that dealers who have not been selling Trapp Brothers' milk are gradually being won over. Last year a conservative estimate by Robert Smith, sales manager of the Trapp Brothers' Dairy Co., credited Kre-Melo cheese with 25 per cent of the increase made in milk sales over the previous year.

Kre-Melo cheese is a sweet milk curd and is ready to serve. It is guaranteed to be sweet and fresh with a replacement-if-sour assurance. Attractive colorful advertisements in the street cars and on billboards tell the story of the deliciousness of Kre-Melo cheese. Advertisements in the daily newspapers tell housewives of delicious new uses for this distinctive cheese and urge her to serve it daily.

Trucks of the Trapp Brothers' Dairy which carry milk to all parts of the city have a picture of the container in which Kre-Melo cheese is sold.

This advertising has resulted in a wide demand for Kre-Melo cheese. Dealers who were previously proof against any arguments of salesmen urging them to sell Trapp products, were eager to take on the new line of cottage cheese. "I personally know dealers who had always insisted that their customers would not care to change to Trapp Brothers' milk, who literally opened their ice box and told us to put in a supply of Kre-Melo cheese. The demand for the cheese changed their minds about the kind of milk their patrons would drink and these same dealers are now selling Trapp Brothers' m to their own and to their customers' satisfaction."

The Trapp Brothers' Dairy is a comparative n comer in Milwaukee as the histories of the local dai go. It has been established since 1912—yet today it s 15 per cent, approximately, of the milk sold in grea Milwaukee, and from 1,400 to 1,500 pounds of Kre-M cheese daily. The demand for the cheese extends as as Chicago, Port Washington, Waukesha and other s rounding cities. There have been inquiries for it as away as West Virginia!

In the development of their dairy business, Tra Brothers have followed carefully worked out plans keep old customers and to attract new ones. They not merely advertise the fact that they are interes in their customers—they show the customer that t are interested! The milk delivery man calls upon customers once a month, in addition to the day on wh he collects the bill. If the customer is a new one, friendly calls come twice a week for the first few wee This is a part of Trapp Brothers' service plan.

"We consider the milk business more than a m merchandising scheme. We are selling health. We everything we can to raise the selling of milk to a hig plane in the eyes of the public and in the eyes of men," said Mr. Smith in an interview.

"To this end we have meetings of our delivery m We have seven foremen with ten men under each fo man. Each ten men and their foreman are conside one group. About once a week we have a meeting each of these groups. At the meeting we discuss m ters which are vital to the milk business at that par ular time. While I am in charge of the meeting, it of assumes the form of an open forum in which each n can express his opinions, relate his experiences a offer his problems. If one of the men has developed idea for increasing sales, or has been unusually succ ful in following a plan which we have suggested, have that man tell about it at the meeting. Coming fr

of their own number, the story has an added in- t.

Among the subjects which we have outlined for ner sales topics are:

1. Put more effort on sales.
2. Handling vacation customers.
3. Emphasize by-products.
4. Kre-Melo.
5. Buttermilk.
6. Butter.
7. Cream.
8. Care of products in warm weather.
9. Collections.
10. Hot weather objections.
11. Lessen returned goods.
12. Buying motives.
13. Bottle returns and losses.
14. Getting prospects.
15. Sales demonstration.
16. Establishing new customers.
17. Service plan.

'Each of these subjects is interesting to the delivery . He has problems on his route which come under ost every group—for he is a salesman, collector and veryman and the size of his pay check depends on well he does all three things. We try to offer him ething concrete at every meeting which will help do his job better. We give him definite answers is problems and show him how to solve them.

'From time to time we have meetings of all of the . Sometimes we have men from our own organiza- talk to them. Sometimes we have outsiders come o give the men their slant on the vital subject— to interpret the wishes of the customer. This is, ntially, the salesman's problem.

'Coming from an outsider, the story has a slightly erent and often a more convincing sound than it does comes from someone inside the organization. Not ago we had James Fiske, a recognized merchandis- authority, talk to our men. Mr. Fiske talked on customer's viewpoint when buying dairy products interpreted it to the men. We have had advertis- men talk to our men on the most effective way to use ertising literature. We have had dairy experts.

'These meeting are really a training school for sales- in which we try to get our men to look at the sub- from the customer's side, to anticipate her objec- s and to be ready with answers to them, as well as e well informed on dairy subjects so that he can her interesting facts about the business which are to her.

'The data which they get at these meetings they to splendid use when they call on our customers. require our men to go around and call on their cus- ers once a month in addition to their regular call to ect the bill. Somehow nobody likes a bill collector e is only that. It is human nature to hate to part a lump sum of money at the end of the month for ething which is already consumed and forgotten. we want our customers to be friends with our de- ry men, so we require our men to call once a month, r the bill has been paid and forgotten. They come tly dressed, clean shaven, and in a friendly, smiling ask if the service has been satisfactory or if the omer has any suggestions on how to improve the ice. There are many things which can happen which not the fault of the dairy or of the deliveryman but ch might be held against both. Dogs will upset bottles. Thieves will occasionally steal milk or m on a day most inconvenient for the consumer. am sometimes will not whip when the company has ved and is waiting in the dining room for the cream e or schaum torte. None of these things may be fault of the deliveryman or the dairy, but an angry and disappointed customer, who knows her milkman only as the fellow who comes around to collect the bill, will leave a curt note in the morning asking the milkman not leave milk any longer. When the milkman is a friend of the housewife and if he calls regularly and does not dodge her after an unfortunate occurrence like this—of which he knows nothing but she knows all too well—she will be far more amiable and reasonable.

"In the case of a new customer, we ask our men to go around and call on the housewife a couple of times a week just at first to make sure that she is getting her milk or cream at just the right time and in the exact place she wishes it to be. In this way she gets positive assurance that Trapp Brothers' Dairy is vitally interested in pleasing her.

All Trapp Vehicles Carry This Advertisement of Kre-Melo Cheese.

"These calls on customers give the deliverymen an opportunity not only to straighten out any misunderstandings which may have arisen, but to suggest improvements, although he is not limited to suggest the improvements on this social call—he can make them at any time during the month. However, the call offers a convenient time to do this. For instance, if a housewife has always insisted on having her milk on the third step of the east porch, and if, as the summer approaches, our man should notice that this would bring the milk directly under the sun's rays causing it to be heated and to sour quickly, he would suggest that she leave a box on the porch in which he could deposit the milk to keep out the sun, or suggest that she leave a paper there with which to cover the milk until she takes it into the house.

"Or, take the case of the hostess whose cream wouldn't whip when the guests were waiting. He might explain to her that there are many factors which enter into the proper whipping of cream—age, acidity, test and temperature. Perhaps the bottle had been left on the back porch too long in the morning and the hot sun had heated the cream. This would mean that the cream would not whip. This can be explained in a courteous, interesting way and the salesman might suggest, 'I have something of special interest to you. We have prepared a folder on how to get the best results with whipping cream. I'll bring it along in the morning and leave it under your bottle of milk.'

"Being a friend with the customer is of great value to our men when they are soliciting new customers. The housewife, after she has talked with her milkman a number of times, gets to take a friendly interest in him and in helping him to get ahead. It is easy for the man to say to her, 'You've been satisfied now for a long time with our products and with our service. But there are a lot of people around here who don't buy Trapp's products and I know they would be just as well satisfied as you are if they were to try them.' Sometimes she will volunteer to speak to them herself and will give their names and addresses to her friend the milkman in a few days, telling him to leave milk there in the future. Sometimes she will give him the names and addresses of several of her friends and neighbors and he will jot them down on a pad which he keeps for that purpose. And it is a very unusual woman who will refuse to write down the names and addresses of a few of her neighbors and leave the slip of paper in the milk bottle the next morning.

KRE-MELO
COTTAGE CHEESE
KRE-MELO
COTTAGE CHEESE

A Trapp Window Display Featuring Kre-Melo Cottage Cheese.

"In going out to follow up on the names of prospects given him by an old customer, our milk salesman is accorded a far more friendly welcome when he tells the housewife that her friend has suggested that he call on her and tell her about the Trapp Brothers' dairy and its products, than he would have received if he had merely gone out with a 'cold' name.

"When we coach our man on sals talks, we tell them to call the prospect by her name, 'Mrs. Brown,' and not to stop with 'Can't I interest you in Trapp Brothers' milk?' The perfectly natural reaction to a question like this is 'No, I don't believe so.' We tell them to go out and tell the prospect about Trapp Brothers' dairy and its special advantages to a customer. In other words, we tell them to look at the subject from the customer's viewpoint rather than their own, and to show her that this dairy offers her what she wants and what she cannot get elsewhere. We never knock a competitor; rather, we spend our time boosting ourselves in a positive way.

"We give our men their talking points. One of our biggest arguments is our continuous flow pasteurizing system. They, our men, talk at length on the care which we give our milk, on the tests which we perform to make sure that all milk and cream is up to our standard. They tell the housewife of our special arrangements for returned goods so that it does not come in contact with the fresh milk and cream. The returned goods comes into the basement. The fresh milk and cream enter on the first floor. Bottles do not come in contact with the cream or milk until they have been thoroughly washed and sterilized. This is a very good talking point because most women shudder when they think that the bottles which they may be getting might have come from kitchens not so fastidious as theirs, or in which there might be some communicable disease which has not yet been diagnosed or quarantined. The washing is done with pure artesian well water from a well 700 feet deep inside our own building.

"We supply our men with scientific data on milk that they can meet most arguments on the food val of milk on the spur of the moment, or can find the i formation in pocket manuals. We have known cu tomers who were temporarily hard up and who decid that they would stop our milk altogether until they g their bills paid. Our men call on these people, prove them that a diet of bread, meat and potatoes is entire too starchy and does not have the health-giving value milk, vegetables and fruit. They talk protein, carb hydrates, starches, calories—and they tell the story their own way. Often our men come back with a stan ing order for two quarts of milk where the custom ordered only one before.

"Then there is the customer who wants to get th and is under the impression that milk is what is makin her fat. In a good-natured way the Trapp represent tive will tell her that it is the sugars and starches th are making her fat and will tell her that the avera maintenance diet is from 1,800 to 2,100 calories whi a quart of milk has only about 650 calories. This mea that she would have to drink three quarts of milk befo there would be any danger of her putting on surpl pounds.

"Sometimes the customer will tell the man outrig that she is dieting because she wants to get thinner ar has decided to cut out milk, or at least cut down on th amount she drinks. Sometimes, if the customer is stout woman but does not mention that she wants to b come thinner, our men just take for granted that sl wants a fashionable boyish figure and mention, casuall 'I ran across something very interesting the other da Scientists have proved that milk has sixteen element all of which are vital to growth, and yet milk doesn add a pound of fat. It's foods like potatoes and pie th are mostly starches that do that.'

"Or, if the customer, or prospect, is the type that ca be teased good-naturedly and enjoy it, he might sa 'I've got the best kind of diet for you!' and then sugge milk, telling his story about the scientific value of mil

"The figures will get them!

"Of course, some prospects, and some customers, wi ask questions that only a doctor could answer. Whe one of our men gets into a discussion of a question whic he cannot explain fully he tells the customer, or prospec frankly that he cannot tell her all about it off-hand, bu that one of the men from the office will be around an will tell her. As soon as he reports the matter someor from the Trapp organization calls on the woman an gives her the desired information."

This is the Trapp Brothers Dairy service plan, whic has worked out so successfully, keeping customers inte ested and contented, and attracting new customers. has made the milk deliveryman a salesman intereste personally in his customers and in getting more of then

CHICAGO, NEW YORK MILK DEALERS BID FO ORFORDVILLE, WIS., MILK.

Representatives of Chicago and New York mil firms attending a meeting of the Orfordville, Wis., Co operative Dairy Association July 13, making attractiv offers for the milk of that section.

Dairymen were told that if they could arrange to b sure of sending a worth while amount of milk each day it would be easy to reach the New York and Chicag markets. The idea has met with favor in the communit and steps are being taken to provide the necessary mil supply.

Auto Taxes and the Milk Industry

Sound and Equitable Principles to Control Special Taxation for Motor Vehicles as Laid Down by the Motor Vehicle Conference Committee

EN in the milk bottling industry are big users of motor vehicles. Both in gathering and distributing their product the motor vehicle is tant and fast growing in importance.

ate legislatures have constanly before them the em of equitable taxation of the motor vehicle in- y. At a conference of leading men interested in industry the following principles were suggested em as a guide to tax fixing bodies:

The state should have the sole special taxing agency eral, county and municipal governments should be ex- from the field.

The motor vehicle tax should be simple in form and uted in equitable and just proportion between the nt types of motor vehicles.

No highway should be improved by expenditure of funds in excess of its earnng capacity. The return public in the form of economic transportation is the neasure of the justification for the degree of im- nent.

All money raised by such special taxes should be in the state motor vehicle highway fund and to secure st results should be expended under the direction of ate highway department.

The cost of building and maintaining adequate sys- of highways should be distributed in an equitable rela- the benefits derived. These may be summarized as s:

Benefits to society in general, such as influence on education, recreation, health, fire prevention, police protection, the national defense, the postal service, living and distribution costs.

Benefits to definite groups, such as agriculture, manufacture, labor, railroads, mining, forestry and waterways.

Benefits to property served.

Benefits to road user.

For the purpose of apportioning costs in relation to s received, all highways may be divided into two : First, those used by the general motoring public, econd, those which perform a purely local service on.

Special motor vehicle taxes should be levied and used or the improvement and maintenance of highways used general public, i.e., for general highway traffic flow

The wide variance in valuations, tax burdens, number or vehicles in use and the status of highway develop- in the several states prevent the adoption of any fixed la as to the proportion of total costs of highways of l use which should be paid for from motor vehicle Generally speaking, however, these principles may forth:

In states where the income from motor vehicles is sufficient to meet all of the maintenance costs of highways of general motor use without undue burden to the individual motorist, such funds should be applied first to the maintenance of inter-state and state highway systems.

In state where the income from motor vehicles is sufficient to meet all maintenance costs of highways of general motor use without undue burden to the individual motorist, any surplus should be used for this class of highway reconstruction and administration costs.

In states where the number of motor vehicles will bring in large sums in excess of maintenance without placing undue burdens upon the individual motorist, such surplus should be used to defray all costs of maintenance and a substantial share of all of the other costs of highways of general motor use.

d. In those states where the motor vehicle income is more than sufficient to meet maintenance costs of highways of general motor use without undue burden to the individual motorist, it may be found advisable to use such surplus for the purpose of defraying all or part of the costs of bond issues to expedite construction of economically desirable motor highways.

9. Roads of a purely local interest, serving only local needs, should be financed out of local revenues obtained from local general taxes. Special assessments on adjoining land to defray a portion of the costs of such roads may be justified.

10. Where extraordinary improvements are undertaken in the vicinity of or serving congested areas of population the increment, if any, in property valuation following the improvements should be drawn upon to defray an equitable portion of the cost.

11. Irrespective of the particular form of special tax of the motor vehicle, whether registration fees or motor fuel taxes, the aggregate amount of these taxes in any one year should not be so great as to impose an undue burden on the individual motorist.

⁂

UTICA FIRM IN NEW HOME.

The Sauquoit Valley Dairy Co., Utica, N. Y., moved into its new $75,000 plant late in July. Formal opening of the plant was held on August 1 and 2, and was celebrated by throwing the doors of the new structure open to the inspection of the public.

The plant, which has been under construction since April, is said to be the last word in dairy methods and appliances. The main building, built of concrete blocks, measures 130 by 50 feet, and houses the company offices, and practically all the machinery necessary for receiving, preparing and distributing milk.

A siding from the West Shore Railroad runs to the plant's receiving room, where shipments of milk are unloaded or sent on to New York.

Near the main building are located the company stables and garages. The barn has space for horse stalls, wagons, sleighs, a repair room and hay loft.

In order to provide for normal increase in volume, the company has allowed leeway for expansion. The plant, at present, has a capacity for handling 40,000 pounds of milk a day, although the present volume is only 35,000 pounds.

All of the main operations are carried on in one general room, thus making the work simpler, handier and easier to supervise.

The incoming shipments of milk are first placed in four glass-lined pasteurizers, having a capacity of 330 gallons each. They are then cooled by means of the new refrigeration plant. The ice plant has a capacity of 25 tons.

The new plant will entirely replace the present offices and plant, 403-405 Cooper Street. The company will retain its retail store at 351 Columbia Street, and will maintain a small retail store at the new plant.

Products of the company which will be made in this plant are milk, butter, buttermilk, cottage cheese, milk chocolate and a special grade A, golden Guernsey milk.

Milk Scores Again in Trans-Pacific Fligh

Taking on some "Body Fuel"

"Ernie" Smith, Intrepid Pilot, Trained on Milk and Gave it to His Mechanics....

MILK—the recognized food for aviators—has scored again in the success of the Trans-Pacific flight made by Ernest Leroy Smith, young San Francisco airmail pilot, from Oakland to the Hawaiian Islands.

Prior to the flight ''Ernie'' Smith trained on milk. He knew he must have a boundless supply of energy, and his nerves must be steady to meet the exigencies of the exhausting 25-hour journey across the sea. Like an athlete he prepared himself for the contest. He drank two glasses of milk at every meal. He drank milk between meals. He drank milk while he worked over his plane, the ''City of Oakland,'' on the flying field. He refused coffee and tea and other stimulants with the quiet remark:

''I never drink anything but milk when I am flying.''

Then he told his auditors what milk had meant to him during his training days on the University of California Rugby Team. Yes, ''Ernie'' was a football player before he became an aviator at the time the United States entered the World War, and even in his college days he realized that it is physical fitness that ''puts the ball over the line.''

When ''Ernie'' took up flying he demanded mechanical perfection in his plane, and physical fitness in himself, both co-operating for the success of any undertaking.

To put the Travelair in shape for the take-off the mechanics had to work day and night. ''Ernie'' wanted to be the first flyer to hop the Pacific, and it became a contest between the United States army and the civilian. It was exhausting work—this race against time. The men became thin and haggard, and a distinct let-down in efficiency and energy was noticeable. Smith knew they needed milk. He appealed to California Dairy Council for aid. He received it. Two crates of milk were immediately sent to the hangar, and from that time until the completion of the plane five days later, the mechanics were kept supplied with the energizing food.

Milk did its work, just as Smith knew it would.

''Milk is just the thing these boys need,'' said Anthony Parente, backer of the flight, ''it gives them the necessary strength and nourishment.''

And the boys coincided in Parente's opinion with such characteristic expressions as, ''Milk is sure great!'' ''O, Boy; more milk!'' ''This milk sure peps up my motor.''

A. R. Wild, supervising mechanic and aircraft engineer and builder, gave milk credit for keeping work going, saying, ''Milk is keeping those boys at it; it's good for them. Some of the men are drinking three quarts a day.''

When the Travelair was moved from the San F
cisco machine shop to Bay Farm Island flying field
the final tuning up, Council saw that the milk was
livered to the mechanics each day.

The Oakland-Hawaii flight promoters knew what
Council was doing in a nutritional way. They wa
''Ernie'' Smith and Emory Bronte, his navigator, t

"I'll Say It's Good."
Mechanics Building Plane for Trans-Pacific Hop Pause f
Nourishment.

safeguarded in every possible way should anythin
wrong with the plane. So they asked Council to s
the proper food and correct rations to sustain the a
tors for 10 days, in case the monoplane was force
drop into the Pacific.

The list was made up from a nutritional standp
consisting of food necessary to sustain basal metabo
for ten days. The rations were packed in a watert
tin box which was strapped to the plane. This is
the flyers took with them:

Six pounds pilot bread, one pound dried apri
one pound hard cheese, 30 ounces raisins, one p
prunes, one-half pound can butter, two cans milk,
dozen meat and cottage cheese sandwiches, three ou
malted milk tablets, 24 ounces canned tomatoes, and
can opener.

Then came the day of the hop-off, and three qu
of fluid milk were tucked away in the cockpit in a
tion to the two cans of milk included in the emerg
rations.

''I'd like a drink of milk just before I go up. I
it sustaining,'' remarked ''Ernie'' as he finished a
bottle. Then, he added with a quick smile, ''Th
going to be a long hop, and I shall want several gl
of milk on the way over.''

The world knows the story of that flight. It k
those indomitable men had need of every bit
strength and energy they possessed.

Lost to the world for five hours—their radio crip
—their supply of gas running low—their oil pump

battling through wind and fog, unseeing and un- until every drop of gasoline gone, they dropped he arms of a friendly Kiawe tree on the lonely Isle lokai, 50 miles from Honolulu.

at trip took stamina—spiritual, mental and physical na. The former are the essence of character, the sheer bodily endurance, all equally necessary in erformance of such a feat.

So you see, milk comes in for a goodly share in the glory of that Trans-Pacific flight. It was milk that gave the mechanics strength to work day and night to build the plane; it was milk that gave "Ernie," the pilot, the physical endurance to hold on and win in the face of terrific odds.

How to Keep the Bacteria Count Low

Count Can be Kept Low With Old Equipment if Proper Methods are Followed. Chlorine Solution Most Effective

By H. W. VETTERLEIN*

E ARE all striving to put out a bottle of milk with a low bacteria count. To attain this object, we should have a fairly low count in the raw Try to show your farmer patrons how to produce milk. Give his cans back to him in a sterile, dry tion. In the past, this has been a sore spot in the business—neglect of the milk cans—but now with utomatic washers, we don't hear so much complaint. very farmer should be shown how to properly , filter and cool the milk and keep it cold until ered. Everything that the milk touches in the should be sterile. As we get through with each of apparatus, it is first rinsed with cold water, brushed with fairly hot water to which has been l some good water softener or cleaner, then ned with live steam until too hot to touch. In the ing we fill the weigh can with boiling hot water, pump it through the entire system. Then insert e into a sanitary pipe, and turn on the live steam 0 minutes. Any apparatus that we can't reach this we hold the hose and steam until the surface is ot, or rather, too hot to touch. This applies chiefly eigh can, receiving vat and surface cooler.

e next fill the weigh can with cold water, and add a small quantity of chlorine solution. This can ade of chloride of lime and water, or salt water ed with an electric current, or can be purchased in ncentrated form, either in tablets or liquid form. the chlorine treatment everything is rinsed with , cold water.

is also a good plan to use the chlorine solution on bottles and afterward rinse with cold water. When oing the solution through the system any parts that not touched by the chlorine, such as pasteurizers, can be covered with a small sprayer.

here is a wide difference of opinion on using chlo- Some boards of health are against it, while others nd it. It was my pleasure to work in a city where nspector insisted on us using chlorine, and we had ge monthly bacteria counts as low as 1,000 .c., and for two years, we had only a few counts 10,000 bacteria per c.c. A low bacteria count milk eam, if kept cold, will keep sweet a long time, pro- l it has been properly graded and pasteurized.

e often hear arguments on how much easier it is to ow bacteria counts with new apparatus, or glass- pasteurizers. It is all bosh. You can get just ood results with a system installed ten years ago, ou can with one installed this year, provided you keep it sterile and are sure of your pasteurization temperature and holding period.

We always pasteurize to 145 degrees F. and hold for 30 minutes. I believe the continuous flow system is doomed because there is so much chance of milk getting through before the 30 minutes are up. With the vat system, and recording thermometer, you are sure of this. Flush valves are also necessary.

It begins to look now as though steam pasteurization, as we know it, will be done away with, if the claims of some experimenters with electricity are to be believed. As I understand it, the milk is treated with an electric current and it serves the same purpose as pasteurization. Guess it will be a long time yet, though, before this comes to pass. It is only 35 years ago that milk was first pasteurized. At the Chicago World's Fair in 1892 some milk was pasteurized in bottles.

Three years later the first pasteurizing machine was invented. Now the smallest plants are using some of the best pasteurizing apparatus.

Another source of bacterial growth, is when milk is bottled which is not cold enough, and not keeping the refrigerator at low enough temperature. We try to bottle all milk at 38 degrees F. and keep the refrigerator at that temperature also.

I have often wondered if it is a good plan to publish the bacteria counts from milk plants where the samples are collected by the inspector. Sometimes there is a feeling that he favors one plant more than another, and might not deliver the sample to the chemist as soon as he could. I know a city where this very thing happened, and now they just publish the names of the plants, as having, or not, come within the bacteria limits set by the board.

The only way to keep the count low is to be everlastingly careful.

PENNSYLVANIA CO-OPERATIVE ASSOCIATION BUILDS NEW MILK PLANT.

After operating for eight years in their original building, the Kane Dairy Co-operative Association, Kane county, Pa., is building a new stone and concrete structure to house their milk plant equipment.

About sixty dairymen in the county are members of the association, which is operated on a strictly co-operative basis. New equipment is being installed with an idea of efficiency and sanitation in handling their product, says A. T. Larson, president of the association.

Plant Superintendent, Sauquoit Valley Dairy Co., Utica, N. Y.

Getting the Money for Your Milk

An Established Credit Policy Aids the Milk Dealer. Whatever Method May be Used, It Should be Applied Rigidly

By E. J. CLARY*

WITH a large number of comparatively small accounts, which is a condition commonly met with in the market milk trade, collection problems appear which are absent in many other lines of business.

Laxity in formulating an established collection policy is certain to result in cash losses to the milk plant, and unless this end of management is fortified by a strict application of such a policy, a weak link is immediately found in the merchandising plan itself.

No matter how you look at it, collections bear importantly on sales and the development of any milk business. Experience has taught that an adequate policy on collections will help business development for the milk plant and that an inadequate policy will retard it.

The fear that competition lurks in the background whenever the milk plant or the milk dealer uses aggressive methods to collect his money, is not borne out by the facts. The best managed plants in the trade have rigidly applied their collection policies after finding out that laxity in such matters never pays.

In the auditing of numerous milk plant books in recent months, some interesting points have been brought out with regard to collection methods.

In any business where delinquency increases in time units of days or even weeks, accounts must be watched with greater care than when the delinquency is the result of a single purchase in a 30-day period.

Another point of importance is this: The product of the plant is soon consumed and the psychology of credit shows that collection is more difficult in the case of real delinquency is concerned when the product is perishable and quickly consumed than is the case where the purchase is represented by a permanent and material article.

Business That Doesn't Pay

Collections have been and always will be an important factor in the successful operation of any plant. The idea of building up a permanent and increasing sales volume, or a profitable production, on NUMBER of accounts, without regard to quality, has been discarded by the most progressive. The writer of this article, continuously auditing accounts for the trade, voices some opinions picked up in this connection.

Small Accounts Seem Unimportant.

The manager of one large plant said: "Small accounts seem unimportant to the consumer. That's why they have to we watched more closely."

In formulating its collection policies, one large Eastern plant set distinct limits on service in case of delinquency and applied them rigidly. These limits were in every way fair but fell considerably short of the time allowed generally in the trade. The results on sales and new business extension was, upon the whole, healthy. This was especially true in the sales made to and through retailers.

There have been no exceptions made under any circumstances and this fact is made clear to every new consumer and retailer.

A great many plants put undue faith in form lett statements and pleas for payment. This appears to the only practical method of collecting money from consumer and the retailer. But, as reasoned out by Philadelphia plant, a delinquent is a delinquent an he is behind with one creditor he is behind with oth and therefore form letters and statements—even sonal calls—are part of the business of the day. Philadelphia plant treasurer simply notifies the custo that his account is overdue—that within five days s ice will be shut off and this is done over the teleph politely but firmly.

In the best regulated plants in the industry, i generally agreed that the weak spots in collection as follows:

(a) The habit of bluffing the delinquent.

(b) Failure to set distinct li to credit in the beginning.

(c) Flooding the delinquent form letters and statements.

(d) Failure to have a daily ch up system on delinquency.

Very Little Trade Lost.

In any staple trade today producer who gives the service not afford to waste his capital bad risks, and as a real commo is involved, with a definite va the loss becomes a real one. C petitors do not want the busi of delinquent customers so tha resolves itself down to this:

The plant with a rigidly app credit and collection arrangem skims off the cream of its field.

Such a system helps busi building in other ways.

Where a delinquent is shut of a certain point, law suits and collection costs are duced, if not eliminated.

If the delinquent reinstates himself, as he usu does, he will be a better customer afterwards, hav learned the lesson of reasonably prompt payment.

The customer so treated has a feeling of respect the plant independent enough to cut him off when deserves it.

I find that the best managed plants work on a t schedule basis which is automatic and which become mere matter of bookkeeping routine. Accounts fall i three classes:

1. 10 days overdue.
2. 20 days overdue.
3. 60 days overdue.

In one case, the bookkeeping department, having tablished these three stages of delinquency act as lows:

A delinquent who falls into class 1 is merely noti of the fact.

---

*Management consultant.

delinquent who falls into class 2, is warned.

delinquent who falls into class 3 is notified that e will stop in three days, and it is stopped.

No Need for Antagonism.

o plant can afford to unduly antagonize its custom- vhether they are delinquent or not. Handling them ully, though firmly, is simple enough and need leave ard feeling. It is far better in the results gotten t and explain than to threaten and annoy. The method conveys a feeling to the customer that the is sufficiently independent to assert its rights, and ffect is beneficial to the business.

he employment of staff collectors is, of course, a business policy and need in no way interfere with tem of collection that is distinct and which is rig- applied.

s a matter of fact in some instances I find that the nal call will cause a rigid credit policy to work tter advantage, providing the collector understands the plant's policies and that they are rigidly en- d.

But the chief job of the collector under these circumstances is to collect the amount due after service has been shut off.

In some instances, the smaller plants have tried out the weekly payment basis and, while this system appears to work pretty well in the case of domestic trade, it will not do so well in the commercial line, especially among hotels, hospitals and retailers. It is questionable whether such a short term basis will not so increase the plant's overhead as to nullify its good results.

The treasurer of a fairly large plant in New York was asked recently what policy he had adopted on collections and he replied:

''We simply push them when they don't pay up—handle each case on its merits.''

This plant revealed 467 accounts that looked uncollectible and carried on its books over $102,000.00 in out-and-out delinquent accounts.

It is in line with the best business policy in this country today to establish a definite policy on collections and then—stick to them.

The Bottle Cap Not to Blame

Probable Cause of a "Cap" or "Pulpy" Flavor in Certified Milk. Use of Abrasive or Scouring Powder on Certified Milk Equipment Must be Exercised with Care

By SOBEY OKUYAMA*

PECULIAR flavor which may be defined as a ''cap'' or ''pulpy'' flavor has been brought to the writer's attention at various times in the last years. It has been noted at four different plants this laboratory's control. It has also been noted rtified milk in Boston and St. Louis. Mr. Posson e United States Department of Agriculture spoke e common occurence of a ''cap'' flavor in certified exhibited at the annual meeting held at Atlantic n 1925 and it is thought that the same flavor was ted there as is discussed in this article.

peculiar feature of the flavor is that the consum- ublic apparently does not notice it. One restaurant 500 bottles of certified milk has never had com- s but we have noted the flavor frequently when asing certified milk there.

characteristic of the flavor is that it is never found k just when bottled. The flavor takes 24 to some- as long as 72 hours to develop. In samples hav- strong taste, a smell similar to that from green soap e noted.

e to the fact that the flavor does not appear regu- it has been very difficult to work out an extended igation until recently when one farm's product ped the taste regularly.

mples were first taken from every point in the ess of the milk from cow to bottle. Samples were from the barns, carrying cans, pouring tank, pipe cooler, holding tank, bottling machine and filled s. Care was taken that there was no contact of ilk with the cap. The samples were immediately and held in an ice box and sampled for flavor at and 72 hour intervals. Samples from the cooler d showed off flavor.

previous work no barn samples showed this flavor herefore another batch of samples was prepared warm barn milk and pouring this over or through every piece of equipment, a check sample of barn milk being kept. This showed the trouble in the cooler.

The whole experiment was run again with 15 samples, seven not going over the cooler and with eight over the cooler, and not labelled given to three samples. All checked out correctly with off-taste passing over cooler.

The cooler had been scoured to a coppery appearance. After being well retinned the flavor stopped.

On previous work, there was no such evident discoloration or exposed copper and in one case the cooler appeared perfect but occasional flavor developed to a slight degree with torn up caps but not sufficient to call this a regular cause.

Apparently some chemical action of copper or brass on raw milk is the cause and it is suggested that where this flavor appears every piece of equipment be checked and retinned even when it appears in perfect condition. The flavor is not that usually spoken of as metallic as laboratory men from large distribution companies could not define the flavor as metallic.

Another suggestion would be that dairymen at certified plants be very cautious in the use of abrasives and scouring powders in washing equipment over or through which milk will travel.

Summary.

1. A peculiar flavor which may be defined as a cap or pulpy taste has been found in certified milk from various parts of the country.
2. The flavor develops 24 to 48 hours after bottling.
3. The flavor does not always come regularly.
4. No unusual bacterial growth has been noted.
5. Cause is apparently a chemical action of exposed copper or brass on raw milk.
6. Use of abrasives or scouring powder on certified milk equipment should be exercised with extreme caution.

How to Get Customers' Attention

Positions Used for Dairy Products Advertising in Local Papers are Important. How Some Advertisers are Doing it

By J. T. BARTLETT

THE position of a dairy products advertisement is like the location of a store.

What street a store is on, and just where, determines the people who pass the store—and who see its window displays. In exactly the same manner, page position affects "reader traffic" for the dairy products advertisement.

One group of readers turn first to the sport page. Another seeks the financial pages. Women are partial, naturally, to the society page.

Then there are pages of far less specialized reader traffic—the news pages, and the editorial page.

And when the subject of particular page has been settled, position on that page comes up. How can a dairy products advertisement be placed so that, of all seeing page 9, for example, the largest possible percentage see the advertisement?

Considering examples from various parts of the United States, we can make interesting and helpful observations.

From Tulsa, Okla., we have an unusual position. The advertiser is Purity Ice Cream Company, and the issue is a Sunday one, and the advertising space is single column by nine inches. In this particular instance, the "funnies" are involved. The syndicated material, printed in colors, does not occupy the full page. There is about a column of space on the right side. Various advertisers have taken space here.

Right here, where reader traffic of children especially is heavy, we find Purity Ice Cream Company represented. With thoughts for children especially in mind, dairy products advertisers will use similar position to this. At Denver, one advertiser has used the foot of the front page, comic section. Probably as a class, too, followers of the comics are especially interested in ice cream, candy, and kindred products. The advertisement of Purity Ice Cream Company has the cut of a child eating an ice cream cone, together with a brick of ice cream, heading the insertion. At the foot of the space, below the advertising signature, is a half-tone of the company's sunlight factory.

Positions observed of a great many dairy products advertisers undoubtedly reflect no special thought on behalf of the concerns represented. The latter have simply contracted for run of the paper, and the newspaper has placed the advertisement where convenient for it. Of course, where run of the paper is contracted for, the advertiser has some restrictions in mind. The financial pages are very poor for ice cream advertising. Readers of these pages have their minds strictly on business matters. Again, they are largely male adults—with a large proportion of men rather well along in years. This reader traffic is not a favorable one to work.

Similarly, most advertising men consider sport pages poor for food products advertising, including ice cream which is, besides, a refreshment. The editorial pages are not taken to be ideal for most products. Not specifying special pages, the dairy products advertiser can see to it his copy is not placed on the mentioned pages which will, usually, penalize it.

A two column by six inches advertisement of United Milk Company, San Francisco, is found upon pag
second and third columns at the foot. Second and t
pages are both considered excellent for general ad
tising. Of the two, page three, to which a great de
matter frequently runs from the first page, is per
preferred. The point on the page of this United
Company advertisement is usually considered no
good as on other parts of the page—notably the u
right corner. Laboratory tests have illustrated the u
right corner to be, ordinarily, observed by the la
number of newspaper readers, other things being e

Large insertions of dairy products advertisers
a habit of appearing on the right side of the page.
Los Angeles examples do this. One is the Sanitary
Seal Dairy Company. The space unit is full page d
by four columns. Page five is used.

In another example, the unit is two columns by
depth. This advertiser is Arden Dairy, Inc., and
page is twelve—on a household economics page,
position for obvious reasons. The woman reading
household page has her mind on her "business"-
kitchen and home.

When full depth single column space is used
extreme right of the page is usually preferred by
vertisers. This applies to all trades and industrie
was the position used for Morning Glory butter,
Houston, Tex., advertisement. A problem of len
single column display was solved by this particula
vertisement in an unusual way.

Silhouette sketches occupied over half the space
ginning at the top. First came, with caption, "Hu
Cottage." Then in order were, "Majestic Mansi
"Cozy Apartment," "Luxurious Hotel."

The copy followed this, one word to a line—"E
where good things to eat taste better when served
Morning Glory butter." A carton of the brand
pictured, and on a single line the slogan given, "Ar
crat of the dining table."

Unquestionably, the clever illustrative idea f
in the silhouetted cottage, mansion, apartment and
contributed to the effectiveness of this page-depth, s
column advertisement.

The dairy products advertiser should carefully
low his own advertising, and note positions sec

No. 90 New Series De Laval Separator at Watertown Milk Producers Co-operative Association.

No longer new— but still years ahead

THE New Series De Laval Separator is no longer new. It has been on the market for more than a year and hundreds are now in daily operation throughout America.

—Yet it is as far ahead of all other separators today as when it was first announced—further ahead, in fact, for now you can install it on the basis of *proved* economy and *proved* efficiency.

As a matter of fact, it is the opinion of users that in the New Series De Laval the very maximum of separator efficiency has been attained. In other words, that there will never be a separator capable of skimming cleaner or producing better cream, or of greater mechanical perfection.

Remember that this is the opinion of users based on their own experiences. All claims made for New Series De Laval Separators have this same foundation.

On the subject of skimming efficiency, for instance, many users report readings of ½ of 1/100 of 1% by the Standard Babcock test, and some state that they are unable to obtain any fat readings at all—this with the machines operating at full rated capacity and with milk at normal temperature.

That is a sample of what you get when you install a New Series De Laval—not claims based on laboratory tests—but *proved* efficiency in hundreds of plants like your own.

Get full details of your 1935 separator today.

Preparations for the Big Cleveland Convention

Accommodation for 10,000 Visitors are Available. Cleveland Chamber of Commerce Officials Co-operating with Exposition Officials to Insure Comfort for Everybody

THE convention board of the Cleveland Chamber of Commerce has underwritten more hotel rooms for the use of visitors at the coming Dairy Industries Exposition than have ever been similarly guaranteed there before, not even excepting that heretofore greatest-of-all shows held in Cleveland, the American Electric Railways Exposition of 1926.

Beyond the total of this underwriting—which will assure accommodations to between 8,000 and 9,000 persons—the actual greatest capacity of the city's hotels as a whole has further limits. An exposition attendance of 10,000 persons on the same day can readily be accommodated.

The number of rooms guaranteed presages the vastness of the coming show. It also carries the suggestion that now is the time for every prospective visitor to make his room reservation—not to leave it to the last moment and be forced to take what is left.

Choose From 30.

The following hotels, all conveniently located at the exposition, are open to reservations at this time—(ice cream manufacturers will, of course, concentrate on the Hollenden, which is their convention headquarters): Cleveland, Statler, Winton, Olmsted, Auditorium, Allerton, Colonial, Fern Hall, Hermitage, Mecca, Murphy, New Amsterdam, Alcazar, Bolton Square, Doanbrooke, Fenway Hall, Griswold, Mt. Royal, Park Lane Villa, Regent, Sovereign, St. Regis, Wade Park Manor, Westlake, Euclid, Carnegie, Garfield.

More Than a Year's Work Involved.

When some 9,000 dairy products manufacturers visit Cleveland in October, they will witness the most extensive display of equipment, machinery and supplies used by their affiliated industries that has ever been assembled at one time under one series of roofs.

To get a clearer picture of the extent of this show, they can conceive of it spreading over approximately five acres of space or as forming a roadway sufficiently wide to drive their cars for a stretch of six miles.

Few of the 9,000 realize the work required to place before them this vast display of items to their industrial welfare.

Even before the conclusion of the Detroit Exposition in October, 1926, representatives of the Dairy and Ice Cream Machinery and Supplies Association had visited convention cities in every part of the country in search of that one which could best accommodate a show catering to the great dairy products industries.

The Detroit show concluded, Cleveland was chosen as the most logical site for 1927. Plans were immediately begun, numerous contracts covering building rentals, booth equipments, decorations, electricity, gas, water, trucking, labor and miscellaneous requirements prepared. Floor plans were drawn and re-drawn, exhibitors' contracts and information sheets printed.

Over the Top for Booths.

Then on April 25, at the zero hour, began one of the greatest leasings of booth space that has ever been recorded. Two switchboards hummed with calls association companies located in every part of the c try. Western Union messengers delivered 60 telegr Representatives of more than 35 member houses aw their turns in the association offices.

In three hours 130 member companies were pl Since April 25, the remaining space has been take member and non-member companies—a total of exhibitors! Contracts with them have been exec plans checked to insure a harmony among displays, a thousand details attended to.

Work About Completed.

With this great volume of preparatory work pleted, hundreds of exhibitors' representatives now forward to the actual period of installation, to those weeks immediately preceding the show when car of displays will be shunted on Cleveland sidings, transferred day and night into the designated expos booths.

All Week for Milk Dealers.

The International Association of Milk Dealers conclude its convention in Columbus on Saturday, 22. Cleveland is only four hours distant. Monday find many of the Columbus delegates of the prece week inspecting the market milk equipment and plies displays in the great exposition.

The range and number of these displays in this y show will be so outstanding that milk dealer attend both by members and non-members of the internat association, will be both numerous and closely inter —so leading milk company operators and machi men predict—from the first open hour of the sho through to the last.

More new milk equipment will be demonstr probably, than has ever before characterized a nat exposition for the milk products field.

It is reported that the Statler Hotel will be at informal headquarters for the visiting members o International Association of Milk Dealers.

Milk Coolers

U-K Coolers provide an immediate drop in the temperature of milk and prevent growth of bacteria after pasteurization. The milk flows down over heavy, seamless, tinned-copper tubes into the drain and there covers the last tube. This tube, the first to receive the cooling medium, is the coldest and gives the milk an extra drop in temperature to hold over until it reaches the storage tank or filling machine.

Constant circulation of the cooling liquid in U-K Coolers is made possible by the extra large manifolds or end-pieces. This steady flow is positive assurance that you are getting full benefit out of the brine or spring water used.

Our engineers will gladly submit a plan and estimate of a cooler of any size, any capacity, or any combination of sections for your needs, at no obligation to you. Write for interesting booklet with complete details.

INTERNATIONAL ASSOCIATION *of* MILK DEALER

An Organization Built on Service to the Man who Sells Fresh Milk in Bott

PRESIDENT — F. H. KULLMAN
Bowman Dairy Co. Chicago, Ill.

SECRETARY — R. E. LITTL
228 North La Salle Street Chicago, I

Big Conclave of the Milk Dealer Clan in Columbus, October 19, 20 and 21, 192

COLUMBUS, OHIO, in 1917 acted as hosts to a small group of representative milk dealers, members of a very small association, with a very large and comprehensive name. At that meeting there were less than 80 members upon its roll.

It will be with considerable pride and pleasure that Columbus will welcome back again this year this youngster, now grown tall. At the tenth meeting in Columbus there was an attendance of less than 100 dealers. At the twentieth anniversary, after two decades of unselfish and splendid service to the industry it represents, the International Association of Milk Dealers has made provision for an attendance of over 1,500 representative dealers from all over the world, the newest member, from Lima, Peru, expressing his hope to be present, with a number of our old members from Great Britain sending their representatives as usual, — one new member from the British Isles having been added to the membership roll this year.

The twentieth annual convention has been organized most carefully and comprehensively by selective, able program committees, representing the several departments of the milk dealer's business, each group having in thought the key note of a "FACT FINDING" convention. The annual meetings of the International Association of Milk Dealers have long been conspicuous because of this particular virtue, that of an educational, instructive, fact finding, annual gathering of the dealers and the department heads, from all states and provinces on the continent.

The entire convention accommodations at the new Neil House, Columbus, one of the most modern convention hotels in the United States, has been set aside for this great annual gathering for the milk dealer clan. Every possible thought has been given to the comfort and convenience of the milk dealer during this convention week.

The plan of departmentalizing the convention for the different branches of the milk dealer's business, which has proved so successful the past three years at Milwaukee, Indianapolis and Detroit, will again be followed, with every effort being made to so arrange section meetings that the topics for discussion will be made available for a greater number.

The full outline of the program of each of these sections will be announced in the October issue of The Milk Dealer.

Chairman of the Sales and Advertising Section, F. A. Webb of Borden's Farm Products Company, Chicago, and his council of advisors, consisting of Milton Hult, Superior Dairy Company, Danvenport, Ia.; W. J. Burnap, Rieck-McJunkin Dairy Co., Pittsburgh, Pa.; L. H. Heller, Northland Milk & Ice Cream Co., Minneapolis, Minn., and K. L. Carver, Crescent Creamery Company, Los Angeles, Cal., have devoted themselves most aggressively to building up a constructive program along somewhat different lines than past years, but which the ever increasing tendency to better and more modern information in the advertising and sales departmentals, treating the subjects particularly from the standpoint of the sumer and the dealer salesman.

Chairman of the Laboratory Section, Geo. B. Ta of Chestnut Farms Dairy, Washington, D. C., and S tary R. C. Fisher, French Bros.-Bauer Company, Ci nati, Ohio, have provided a program having particu in mind the theme of sanitary control.

In the Plant Section, Chairman Tilford A. Ewin H. Ewing's Sons, Louisville, Ky., and Secretary Dreux of Rieck-McJunkin Dairy Co., Pittsburgh, have prepared an intensively interesting drawing for the plant managers on the theme of Plant Econo and Efficient Pasteurization.

In the Production Section, Chairman H. D. Dav Supplee-Wills-Jones Milk Company, Philadelphia, and Secretary Walter D. Hunnicutt, French Bros.-B Company, Cincinnati, O., have come forward wit equally valuable constructive outline dealing intens upon those factors that tend for the production of a ter milk supply.

Accounting Program.

Chairman of the Controllers' Council H. R. Ha ton, Telling-Belle Vernon Company, Cleveland, O co-operation with President H. H. Neel, D. H. Ew Sons, Louisville, Ky., and Secretary J. M. Gullans, man Dairy Co., Chicago, and the following district c men: Eastern district, C. H. Kennedy, Harbi Dairies, Philadelphia, Pa.; central district, C. L. P The Polk Sanitary Milk Co., Indianapolis, Ind.; Pacific district, W. B. Edson, Crescent Creamery Los Angeles, Calif., are over alert with new ideas improved methods for bringing home to the min the controller or accountant a more intensive yet plified service of cost and accounting methods, b on experience of several years of operation of th counting bureau and district meetings of the cou The fourth annual meeting of the controllers' co will be outstanding in the history of the association.

General Session Program.

Two evenings will be devoted to programs of ge and national interest, devoting Thursday evening, ber 20, to the annual banquet of the association.

It goes without saying that the program comm will surpass itself in providing a program of enter ment that will be in itself in the nature of a surpri the minutest detail.

Hotel Reservations.

The advance hotel reservations up to the pr time far exceeds the August 1 record of any prev year and if continued at the present rate will resu an attendance that will tax the hotel accommodatio the utmost.

Members of the association are urged to make hotel reservations beginning Thursday evening, ber 18. The convention sessions will open promptly early the morning of the 19th and everybody shoul registered before the opening of the first meeting.

The following convention committees have no dent Kullman of their willingness to serve upon respective committees:

CONSIN MAN IS APPOINTED ASSISTANT DE COMMISSIONER OF THE DEPARTMENT OF COMMERCE AT SHANGHAI.

e appointment of Granville O. Woodard of La e, Wis., a graduate of the University of California ormer American vice-consul at Tientsin, China, as ant trade commissioner of the department of com- at Shanghai, was announced by Acting Director Hopkins of the bureau of foreign and domestic erce.

announcing the appointment, Mr. Hopkins stated Assistant Trade Commissioner Woodard's duties be largely along the lines of trade promotion on American foodstuffs products. China is an ent market for practically all classes of American tuffs and one which is certain to expand as the mic position of the Chinese people improves. ls form the most important class of our foodstuffs ents to Chinese markets, followed by dairy prod- fruits, vegetables, fish and meats. It is interest- note that the Chinese have become very fond of ican canned milk, taking more than a million dol- orth each year.

CHICAGO AND MILWAUKEE MILK DISTRIBUTORS MEET FOR THEIR ANNUAL CONTEST AND ENJOY THE HOSPITALITY OF THE GREENE BROTHERS.

Over 500 Chicago and Milwaukee milk dealers and their friends in the allied industries gathered at Brookhill Farm, near Genesee, Wis., on Thursday, July 21. A special train from Chicago, via Milwaukee, carried the majority of the delegates while scores of autos brought the rest.

Arriving at Brookhill Farm, the home of Brookhill certified milk, at 10:30 A. M., the celebrated coronation ceremony took place. Judge Reniff of Chicago donned the ermine and held court in the open, in spite of the fact that a heavy downpour of rain during the morning hours threatened to break up the whole party.

Lord High Chief Keeper of the Bull, Michael Yundt, was relieved of the duties of his office and Ed. Neumeister of Milwaukee was elected to succeed him. He was duly crowned and after adjournment of court the procession led to the big refreshment tent which served as headquarters for the day's proceedings.

Over $90,000 has been expended this year on new buildings and equipment on Brookhill Farm and the visitors lost no time in giving everything the "once over."

Inside the big tent ample provision was made for serving lunch, cafeteria style, and following the luncheon, a program of music and short addresses was rendered to the enjoyment of all present. It would be unfair to single out any one of the stars because all were artists and rendered their parts exceedingly well. Louis Terna of Chicago was perhaps the most versatile artist in the bunch and his splendid singing brought round after round of applause. Pete Christiansen of Chicago was master of ceremonies.

The annual baseball game between Milwaukee and Chicago milk dealers failed to materialize and Chicago men were claiming that the fellows from the Cream City got such a drubbing last year that they didn't want to repeat the experience. Anyway, the game was not played, and the supplymen substituted for the Milwaukee dealers and with the help of two very rotten umpires the milk dealers got the long end of a baseball score of 21 to 17.

Arnold Christiansen and James Jensen captured first prize for doubles in the horseshoe pitching tournament.

Each year the attendance at Brookhill Farm exceeds all previous records. Men in the milk industry look forward to the annual picnic sponsored by the Greene Brothers and they are never disappointed.

⚜

THREE TESTS INSURE GOOD QUALITY MILK FOR MURPHEY-WARD, CHICAGO.

At least 50,000 pounds of whole milk go each day to the Nichols, Wis., receiving plant of the Murphey-Ward Dairy Company of Chicago.

Three tests are made on the milk by the company so each shipper gets paid according to the quality of the product he brings to the plant. The Babcock test is applied for butterfat, the methylene blue test for bacteria count, and the standard sediment test for sediment. The average butterfat test for the month of June was 3.6 per cent. Patrons receive checks twice a month for their product and are paid according to the butterfat test. During the month of June the price averaged for all patrons was 57½ cents per pound of butterfat.

Special tank cars take the milk directly from the local vats to the receiving station in Chicago.

What the Courts Say:

By LEO T. PARKER. *Attorney at Law, Cincinnati, Ohio*

Court Upholds Giving Milk Free to Obtain Business

Parker's Important Higher Court Decisions Repo

IN THE recent case of Morris, 219 N. Y. S. 143, the Supreme Court of New York rendered a very important decision in which it was held that it is not an illegal act on the part of a milk jobber or wholesaler to deliver milk **free** to certain dealers, and to others for payments, where such acts are done to obtain business. And, further, that the milk dealer's permit is not revokable because of such acts.

The facts of the case are that Henry Morris was the holder of a permit to keep, sell and deliver milk and milk products in the city of New York, which was issued to him after an application had been filed with the board of health on April 19, 1926. He had invested upwards of the sum of $10,000 since the permit was issued to him. On September 8th, last, he received a notice from the department of health that his permit had been revoked. He contended the revocation was prompted, inspired, and directed by certain milk dealers, members of an organization known as the Greater New York Milk Dealers' Chamber of Commerce, "for the sole and only purpose of driving your petitioner out of the milk business so that the Milk Dealers' Association and the members thereof will have no competition."

The testimony disclosed that on August 24, 1926, Patrick Mullen, treasurer of the Greater New York Milk Dealers' Chamber of Commerce, and Barnet Metzger, its secretary, made a complaint to the department of health, to the effect that Morris had violated a so-called order, at a meeting of the board of health, to which all the wholesale milk dealers or jobbers were invited. At this meeting the dealers who attended were advised that "fair competition was always in order, and would not be looked upon with disfavor, but unfair competition, such as the solicitation or the taking away of another dealer's customer, by the giving of free milk, or a cash inducement, or the slashing of prices out of relation to the prevalent market price, would be looked upon with disfavor by this department, as it tended to precipitate these trade wars, in which the sale of adulterated or a low quality of milk generally followed; that any such unfair practices, as hereinabove stated, on the part of any dealer, would be treated as an act that tends to undermine the purity and wholesomeness of the milk supply of this city, and would be ground for revocation of the dealer's permit as a person unfit to sell and deliver milk in the city of New York; that they were then informed to report any infraction of this order, and not to retaliate, under any circumstances, as they had theretofore, and that this department would thoroughly investigate and properly dispose of any such violations as were reported by them."

The board of health revoked Morris's license, and the lower court upheld the decision.

However, it is important to observe that the Supreme Court reversed the decisions and, in issuing an order compelling the board of health to reissue Morris' permit, asid:

"Assuming that petitioner (Morris) did deliver milk
free of charge to certain dealers, and made cash
ments to other dealers for the purpose of procuring
business, he was not guilty, as far as I have been
to discover, of the commission of any illegal acts.
he can successfully sell pure milk of the required st
ard to the distributors at prices lower than the so-ca
market rate, other dealers can, and eventually must
likewise, with a resulting reduction in cost to the
sumers. In that way the public will receive the be
derived from the open competition. It seems to me
a strict enforcement of the penal laws, with severe
alties for violation, will result in keeping milk and
products pure and wholesome. If the possibility
adulteration, as a result of free competition, brings a
a departmental policy which practically eliminates
petition, then the effect is to deprive the public of
benefits which it has heretofore derived from the
forcement.....of the General Business Law....The
pose of this particular provision of our law 'is to des
monopolies in the manufacture, production and sal
this state of commodities in common use, to prevent
binations in restraint of competition in the supply
price of such commodities, or in restrainst of the
pursuit of any lawful business, trade or occupation.'

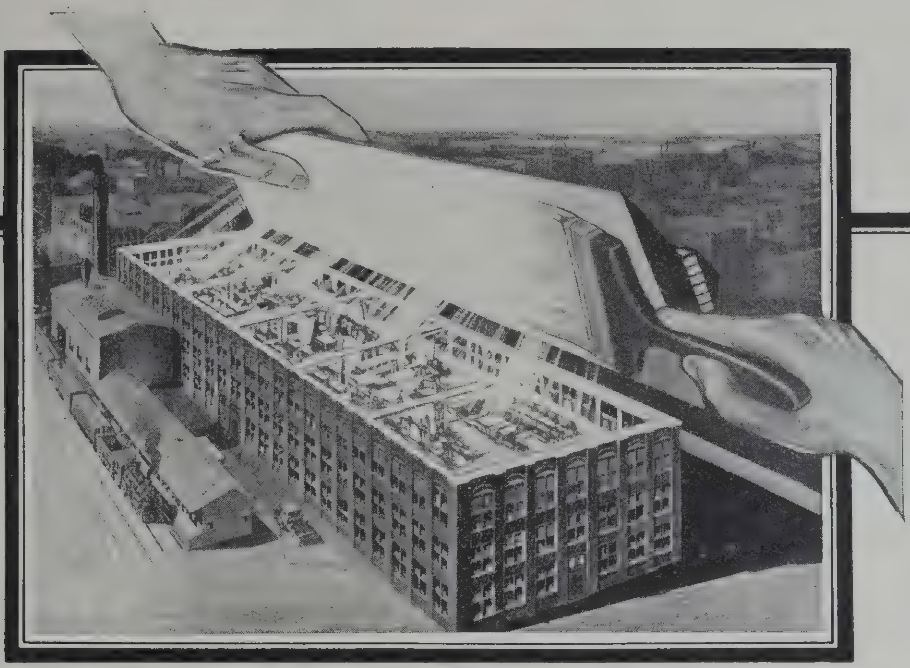
Permit of Dealer Selling Adulterated Milk Revoke

However, in another quite recently decided
Peoples Lodes vs. Department of Health, 189 N.
187, the Supreme Court upheld the revocation by
board of health of a dealer's permit who was convi
of selling adulterated milk. In this leading case
court explained the powers of the board of health t
voke a milk dealer's permit and in effect said that
powers of the members of the board of health are
ministrative merely. In other words, they can issu
revoke permits to sell milk in the exercise of their
judgment, upon or without notice, based upon such
formation as they may obtain through their own a
cies. If, however, their action is arbitrary, tyran
and unreasonable, or is based upon false information
dealer may have a remedy to right the wrong whic
had suffered. If the dealer can show that he and t
acting for him have not been convicted of violating
statute and the conditions imposed in the granting o
permits, and that consequently he is a fit and pr
person to engage in the sale and distribution of
among the inhabitants of the city, then he would b
titled to the relief asked for.

In commenting upon the rights of the board t
voke a dealer's permit, the court said:

"If, however, the charge of the board is true
he has been convicted of the offenses charged the
ber of times stated, the conclusion is irresistible th
was an improper person to be intrusted with the pe
of the city to dispense to the inhabitants of the ci
food product that was liable, if adulterated, to enda
the health of the people."

In the recent case of International Milk Co. vs. Co
219 N. Y. S. 593, it was disclosed that during eight



Lasting cleanliness and light throughout the plant

at the lowest cost per square foot painted!

BARRELED SUNLIGHT keeps a plant interior clean, light and cheerful for *years without repainting.* Yet the cost of applying it is low. A given quantity covers a larger area—and it flows so freely with brush or spray that many labor-hours are saved.

Resists "yellowing" and discourages dirt! Made by the exclusive Rice Process, Barreled Sunlight is guaranteed to remain white longer than any gloss paint or enamel, domestic or foreign, applied under the same conditions. Its surface is so smooth and flawless that dirt can get no foothold, and is easily washed off.

Extremely durable, too. And Barreled Sunlight is guaranteed not to flake or scale if properly applied.

Sold in churn-equipped steel drums and in cans. Where more than one coat is required, apply Barreled Sunlight Undercoat first. See coupon below.

U. S. Gutta Percha Paint Co., 9 Dudley Street, Providence, R. I. Branches: New York—Chicago—San Francisco. *Distributors in all principal cities.*

Now we offer Outside Barreled Sunlight, and recommend it with the same assurance as we recommend Interior Barreled Sunlight. Write for information as applied to your own outside painting.

the International Milk Company delivered to a party named Cohen $1,645 worth of milk and cream.

Cohen refused to pay the account, contending that he had not ordered the product from the International Milk Company, but had ordered it from a firm named the Valley Dairy Company.

It seems that the Valley Dairy Company accepted Cohen's order, but notified the International Milk Company to make the delivery, because the latter firm was conveniently located.

The higher court held Cohen liable to the International Milk Company, irrespective of whether he had ordered the milk and cream from the latter firm or the Valley Dairy Company.

This court said:

"The plaintiff (International Milk Company) alleges that it sold and delivered merchandise to defendants (Cohen) and that defendants accepted the merchandise. It seems to me that the fact that the merchandise was delivered to defendants under instructions from some one else does not affect plaintiff's right to recover..... He obtained the property, or at least part of it, as appears by his admission; and he cannot hold it, and yet refuse to pay for it....Attention is there called to the fact that, when defendants sent their wagon to plaintiff's plant, they must have known that the milk was coming from plaintiff, and not the Valley Dairy Company...We are of opinion that the learned county judge was right in regarding the answer of the defendants as sham."

Ice Cream Company Held Liable.

Few drivers of trucks are instructed of their legal rights and liabilities. Sometimes carelessness on the part of a driver results in his employer having to pend a considerable amount of money.

In the case of Dunbaden vs. Castles Ice Cream 135 Atl. 460, a rather complicated situation for decis was presented to the court.

A truck belonging to the Castles Ice Cream Comp was being driven in a northerly direction. Behind car, and proceeding in the same direction, was a F sedan. Traveling in the opposite direction was anot passenger car. As frequently happens in such situati these cars came together, and as a result of the collis each of the plaintiffs was injured, and sued the Cas Ice Cream Company for damages, contending that n ligence of the truck driver in suddenly turning into path of the oncoming passenger car was the cause the injury.

The lower court held the ice cream company lia for $3,650 damages. The case was carried into higher court, which sustained the verdict.

It has been held on numerous occasions that the ow er of a motor vehicle is liable for injuries which res from his driver suddenly turning or stopping the ve cle without giving due notice to the drivers of ot machines.

For instance, in a recent case the court said:

"The owner of a motor vehicle is liable in damag if he or his driver fails to exercise ordinary care to p vent injuries to pedestrians and the drivers and oc pants of other automobiles. Suddenly turning, with giving due warning to others, is not ordinary care, is it ordinary care for a driver of a motor vehicle suddenly stop without signaling others of his intention

[1] Part of the increase in the creamery butter total for 1926 is due to more complete reports resulting from co-operati with a number of important dairy states in the collection of dairy statistics.

[2] Farm butter estimate for 1926 based upon 1919 and 1924 census reports. The estimate for 1925 was based upon t 1909 and 1919 census reports.

[3] Includes 4,000,000 pounds of farm made cheese for 1925. Farm cheese not included in 1926 figures.

[4] Population according to the census bureau estimates for 1925 was 115,378,094 and for 1926—117,136,000.

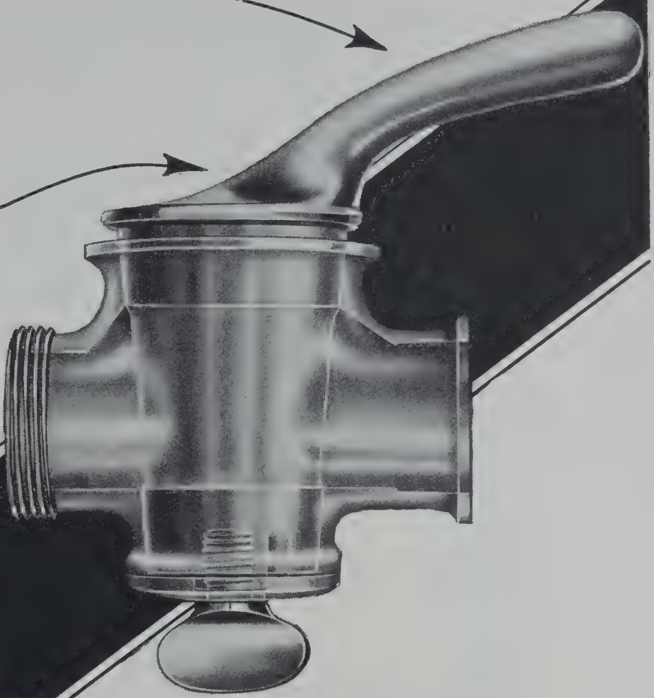
[5] Calves fed whole milk estimated at 85 per cent of number of dairy cows reported by bureau of agricultural economi

This Valve *Typifies* the Fine Designing *in* Burrell Sanitary Fittings

Observe that the handle is of almost uniform thickness and strength throughout—a handle that is gripped easily and held securely, and gives you the feeling that it will take all the pressure you want to put on it.

Note how the broad, strong base of the handle graduates from the full diameter of the plug to its off-center position, giving great strength and powerful leverage.

This flange extends beyond the body of the plug and protects it from injury when laid upon the floor.



Transparent View
Burrell-Simplex No. 10B Sanitary Valve

Valve Plug

The taper of the plug is *relieved* at this point to prevent grooving by the valve body when grinding in.

This *elongated* passageway permits a smaller diameter in the valve plug and body without decreasing the capacity. This design gives: (1) Lighter weight and consequent reduction in strain on adjoining connections; (2) Greater strength in valve; (3) Less chance of leakage; (4) Less liability to warp out of shape when being soldered.

The fine designing and superior quality illustrated in this Burrell Valve are found throughout the complete line of Burrell Sanitary Fittings. They mean economy for you. Send for Catalog Section 321.

Corrosion of Dairy Plant Equipment

Means of Lowering the Rate of Deterioration of Dairy Equipment. Losses Can Be Reduced by Applying Right Methods

By G. N. QUAM*

IT IS apparent to all who are familiar with dairy equipment that general rusting, pitting and tarnishing are chemical and physical changes responsible for much of the deterioration. It is the hope of many that the chemists and metallurgists will some day produce materials which will not suffer corrosion under the normal conditions of plant operation; but no such hope is entertained by those familiar with the complexity of the problems of corrosion. Through extensive experimentation it has been shown that the losses due to corrosion can be lowered and it is hoped that through a closer study of the phenomena methods of construction and operation will be developed which will reduce the losses to a minimum. It is the purpose of the author to point out means of retarding or preventing corrosion thereby reducing the losses due to deterioration of dairy equipment. For the purpose of classification the preventive measures will be grouped under five headings: Composition of equipment, physical condition of equipment, condition of medium, chemical treatment, electrochemical protection.

COMPOSITION OF EQUIPMENT: H. F. French of the U. S. Bureau of Standards (meeting of Amer. Electrochem. Soc., Washington, D. C., 1926) offered the following list of industrial corrosion-resistant metals: Aluminum, copper, brasses, nickel, nickel alloys with copper, lead, tin, silver, zinc, ferrous alloys (steels, ferrosilicon, nickel steels, high chromium steels). It is quite apparent that several of these metals are ruled out at once for dairy equipment because of the toxicity of metal salts or of the physical and chemical changes produced or accelerated in the dairy product. A suitable metal must be uniform and homogeneous in composition. A great deal has been said about the value of purity of metals for giving greater durability and recent developments have shown that the rate of corrosion is greatly affected by the presence of certain foreign elements. Thus in steel the presence of chromium, nickel or copper has a profound effect on its resistance to corrosion. Probably the most common metals used in contact with milk are tin, nickel and aluminum. It is generally true that where a so-called pure metal is used the greater the degree of purity the less the corrosion. High chromium steel has gained much attention due to its corrosion-resistance and will no doubt become an important metal for milk processing equipment. Blount and Bailey of the Exchange Orange Products Company, in a study of the effect of boiling orange juice on metals and alloys give the following order of decreasing resistivity: A high chromium steel, nickel, aluminum (tin was not included). The author has found that a grade of stainless steel (16-18 per cent chromium) exposed to milk under the usual plant procedure indicated no detectable corrosion even by the most delicate chemical tests on the milk ash. Nickel and tin have also given very favorable results. There are those who still persist in using pure copper in contact with milk. Recently the author secured a sample of condensed milk which had been processed in copper equipment, in part, and found that it contained 0.4 to 0.5 mgm, copper per 100 c.c milk. Work of medical authorities (Hess, Mallory and others) indicates that copper has a deleterious effect and should be used in contact with milk any more than with other food product. It is quite significant that the copper kettles of grandmother's days are not to found in our modern kitchens.

Glass-coated metal has been used in dairy equipm but due to its short period of use, little data has b made available thus far. Glass in general is subject corrosion by alkaline solutions and its relative resisti is roughly directly proportional to the silica cont Glass-coated metal that has been chipped is subject localized corrosion of the exposed metal.

Chromium is a very resistant element and its use electroplating steel may do much to aid in overcom losses due to corrosion.

PHYSICAL CONDITION OF EQUIPMENT: Loc ized corrosion is frequently caused by the presence segregations of foreign elements such as carbon in body of the metal, or by internal stresses due to proper annealing. The nature of the surface of metal also greatly affects the rate of corrosion. It generally true that the more uniform and highly polish the surface, the less the localized corrosion. Steel c rying a small percentage of copper forms in moist mosphere a dense, hard layer of rust. Aluminum though a very active metal is quite resistant due to excellent protective oxide film.

If weighed strips of zinc and copper are clamped soldered together and placed in milk for about twen four hours and then reweighed it will be found that zinc has suffered a loss in weight while copper remain constant. The surface of the zinc strip will be more regular after the exposure to milk. A similar con tion prevails when any two or more unlike metals in c tact are placed in milk; the relative corrosion of more active metal (zinc in the above arrangement) w depend on the difference in the potentials or activity the metals involved. In practice, it is not uncommon find in contact in milk such arrangements as: Solder the seam of tin or zinc sheets, tin and copper exposed milk in a partially detinned pipe; brass fittings on pipes, soft iron rivets in sheet steel or galvanized ste and so on.

Speller (Corrosion, page 327) states that the m outstanding and expensive example of localized cor sion on record due to dissimilar materials in contact that of the yacht "Sea Call." The hull was made monel metal plates, with exception of stem, keel, ste port and rudder frame which were made of steel. Mo and iron rivets were used. In a few weeks exposure sea water many of the iron rivets failed, causing lea and upon inspection corrosion of the steel parts w found to be so serious that the vessel was scrapped. T conclusion is easily drawn. Attempt to construct t parts, exposed to one continuous body of liquid, of o pure metal or if more than one, metal must be used, sulate them or coat them over with a continuous layer one metal, or choose metals which are very nearly the same potential. An illustration of the latter is t choice between zinc or camium for coating iron.

It is a known fact that milk is an electrolyte and locations where underground structures become more

less closely associated with poorly insulated rails of electric railways, corrosion due to stray currents may develop. Such cases can be dealt with by testing for the stray current and controlling by proper isolation.

CONDITIONS OF THE MEDIUM: At first thought it may seem that the condition of milk products in the manufacturing process cannot be altered to suit the requirements for control of corrosion but a few precautions may profitably be observed. Metals commonly used are least subject to corrosion in neutral or slightly alkaline solutions. Concentration of air in milk should be kept as low as possible and as uniform as possible. The latter condition has peculiar significance. The concentration of oxygen (air) is not the same at the surface of a liquid as it is at greater depths, it is not the same in a depression (pit) as it is above, it is not the same under a bit of curd or debris on a surface as it is just outside of it. We would observe due to these conditions, cases of surface line corrosion, pitting and spotting respectively. In other words, all of these conditions cause localized corrosion. Corrosion rate is increased by rise in temperature but temperatures involved in milk processing are relatively low. Metals commonly used in contact with milk show no appreciable change up to and considerably beyond the pasteurizing temperature.

Light has been found to hasten corrosion slightly. The data on this subject is very meagre but the precautions to observe are simple.

CHEMICAL TREATMENT: The practice of neutralizing with alkaline products is fortunately a method of lowering the rate of corrosion as well as serving other purposes in the dairy industry. Milk is unique in that it is colloidal in character and thus causes relatively less corrosion than a lactic acid solution of the same acidity. The addition of gelatine to milk to increase its value as a food (an investigation now in progress) will be another step in favor of lowering the corrosive action of milk. The addition of colloids to salt solution has been shown to reduce its corrosive action.

ELECTROCHEMICAL PROTECTION: The effect of unlike metals in contact has been discussed above. The principles may be applied to the protection of a metal such as steel by placing it in contact with a piece of zinc which is more active and therefore will alone be corroded as long as the surface is kept free from oxide. The application of this process has been known for some time as the Cumberland method of protecting condenser tubes in boilers. Zinc has been used by the Navy for protecting its boilers. The potential necessary to prevent corrosion need not be supplied by zinc or some other active metal but an E. M. F. may be applied from an external source. Electrochemical protection methods can be used effectively in preventing corrosion in refrigeration systems or parts of equipment exposed to brine but there may be no great need of such a measure for metals exposed to milk or milk products. The process is deserving of further study in connection with the dairy industry.

CONCLUSIONS: That corrosion is a problem demanding the attention of the dairy industry cannot be denied. A more detailed study should be made of causes peculiar to the industry in order that preventive measures can better be applied. We cannot hope to find a totally non-corrodible product in the realm of metals, alloys or glasses but we can strive to determine which product is best suited to a given process and seek to establish the optimum conditions for operation. The preventive measures enumerated above need not apply strictly to processes involving exposure to milk and milk products alone but may find application to refrigeration equipment or parts exposed to refrigeration liquids.

NEW HOME OF 4-C MILK AND BUTTER.

Less than two years ago two young men who belie
they saw more opportunities in a growing city in I
than in the metropolis of Minnesota visited a num
of Iowa milk plants and creameries and told the pro
etors they were prospective buyers. H. C. Hansen
E. C. Sorensen had been in the creamery and milk b
ness in Minneapolis. They were anxious to get aw
into a smaller city, where they would have more r
to grow.

In Charles City, Ia., a city of 8,000 people with
pasteurized milk, and plenty of good dairy herds
form a firm foundation for a dairy products manufact
ing business, they found an owner who wanted to
They bought the Charles City Creamery Compa
business, good will, plant, equipment and real estate

CHARLES CITY CREAMERY CO.

The Attractive Home of the Charles City Creamery Co.

Their first season, 1926, was spent making a stud
production of milk in the territory, determining
needs of the people of Charles City, and making frie
for themselves among the town and country f
Charles City folk knew little of pasteurized milk,
never drank any at home for it was not obtainable.
Charles City was an up-to-date, growing town, and
new owners of the creamery determined it must h
pasteurized milk.

Their plant was not equipped for a market milk b
ness when it passed into their possession. The bu
ing was too small to permit of installing the necess
equipment. Early this year the old plant was
modeled, a new cold storage room was built, new
frigerating machinery, a new nickel pasteurizer, a bo
filler and capper and a small washer were installed.
day Charles City has pasteurized milk, and is glad
get it. H. C. Hansen, president of the firm, reports s
of pasteurized milk and cream have been gaining e
since they started their milk routes three months

The butter department is also enjoying a heal
growth. Production last year was about 600,000 pou
with prospects for an increase this year to 650,
pounds or more. Most of this is sold in Eastern m
kets, though a large quantity is sold in cartons
Charles City and nearby towns.

William Strikes a Snag

One of Our Readers After Having Sent in His Reservation for the World's Dairy Congress Tour to Europe in 1928 Remembers Something He Forgot

WILLIAM!” says my wife kind of short like, “what's that a map of? Who gave it to you? And what are you looking at it for?”

That's my wife all over. When it comes to asking questions, she can make a professional question-asker at a mind reading performance sound tongue tied.

“Why, Elsie,” I says, puttin' a lot of surprise into the words so's they'd sound genuine, “this here is a map of Europe. Right now I'm as far as Paris, sittin' in one of them sidewalk cafes sippin' conyack.”

“Is that so?” she comes back like it wasn't. “Well, you can keep right on sipping because we ain't going to Europe. And that settles it!”

Now wouldn't that make you feel like a drowned golf ball? Here I've been tellin' the boys at the plant about me and the wife going to Europe next Spring and now my own wife, mind you, slips the skids under the trip. But I guess you know yourself that when a woman says “NO!” it's no time for a man to get mad. So I just smiles and acts polite.

“Why, Elsie,” I says soothin' like, “just a few weeks ago you put your okey on this trip and I sent our reservation in. Surely you ain't the kind of a woman who backs out after she gives her word.” Oh, I'm there when it comes to handin' out the soft soap. But this didn't work so good.

“Well,” says the wife calming down a bit, “you'd better get our reservation out then, because we ain't going.”

“Why ain't we, I'd like to know? Here I been talking big to all our patrons and friends about me goin' to Europe to the World's Dairy Congress and all that, and now you ain't going to let people laugh at your own husband, are you? And make him look cheap?”

That last shot held her a bit. But she don't stay held long. “You didn't have to brag to everybody about it so soon when the trip's so far off yet.”

“Well,” says I kind of peeved at the wife accusing me of bragging, “didn't you tell the woman across the street who's got a cousin who's a shoemaker in Berlin with one hand that you was going?”

“Yes,” she admits, not so cocky this time, “but we ain't going now.”

“So? What's goin' to stop us, I wonder?”

“William, you ought to know better than to ask such foolish questions. We can't go off and leave Gordon and little Oscar alone, can we?”

The kids! I had never thought about them. For a minute I just strokes my chin and thinks hard. Then after lots of stroking and thinking, I jumps up and lets Europe fall on the floor. “I got it!” I says, “the brilliant idea!”

“You always have such brilliant ideas, William. I suppose you want to put Gordon and little Oscar in cold storage over to the plant while we're gone.”

“Nope. I got a better idea,” I says, glad now that I had figured it out so nice. And then I explains how we can put the kids out on my sister's farm for about six weeks, 'cause school will be just about out when we leave anyway.

I get all through oratin' about the advantages of out in the open, on farms and such, and how the will take on weight and get a good color and learn s thing about cows, but the wife sits down sort of gusted.

“It sounds alright the way you say it, William, I ain't got the nerve to ask Amelia (meaning my sis to look after our kids for six weeks, knowing how m they pester me. Not much!”

“Say, listen,” I says, believing I can put the t over on Amelia. “I can handle my sister easy. W drive out and see her tomorrow night, and you let do the talking. If you must say something, tell her well behaved Gordon and Oscar are, and how much t like their Aunt Amelia and always asking us to t them out to see her. That'll make a big hit with And then I'll tell her how it's a shame that kids d often get a chance to go on the farm and get a lo fresh air and sunshine and stuff like that. And t later on, I spring the big idea kind of easy like, and chime in about a dress which maybe you could slip the customs officer and bring her with a real gen Paris label sewed in it. See?”

“Yes, I see,” says the wife, “not. Amelia's got kids of her own, and what with all her work to do, doesn't want to run a hotel. And I don't blame either. Taking care of six kids is no easy business you got at the plant, sittin' around bragging about y trip to Europe which ain't going to be no trip and sh ing maps around, and what you are going to d Paris.”

Sometimes the wife steps on my toes like that a get sore. But knowing there is no use to get mad ab it, I says real sweet to her: “Yes, dear, I know the are awful hard to manage and everything, and that sidering, you've been a wonderful mother to th bringin' 'em up so good. But just think what it me to them to be able to say to the neighbor kids that t dad and mother's been in Europe. Why it's a big th I tell you. When they grow up, they can always back to their happy days on the farm and when me you was in Europe.”

That settles it for the wife. She sighs like she real that after all I'm the superior part of the family all the brains, and then she looks up anxious like.

“But, William, we ain't asked Amelia yet. Supp she says ‘No.’ What are we going to do then?”

“You leave that to me,” I says. “I'll fix it up her pretty.” But just the same, I ain't so sure abou Amelia's sort of hard-boiled; and the last time the were out to the farm, they just about ruined the pl The only things they hadn't wrecked was the barn, that was too heavy to lift. But anyway, I'm good figuring out how to get around women having prove with my wife many a time, so I tells her that everyth will be jake and that she can start in anytime now ing all the neighbors and the Ladies Aid Society ab our trip and advertise it around town so as we get the good we can out of it. But of course, we ain't s Amelia yet.

TOL'S RECORDING (DAIRY) THERMOMETERS

Records of Temperature Guide Pasteurizer Operation

When operatives have ready access to the continuous chart records made by Recording Thermometers they can maintain pasteurization temperatures at exactly the right degree, from the moment heat is turned on until the batch is run off to the cooler. At no time do they have to guess at conditions; a complete story of what is happening is faithfully written into the record line on the chart.

Such records not only help to prevent the bad effects of over- or under-heating, but are *acceptable proof of thorough pasteurization,* where such evidence is required.

The Bristol's Thermometer is simply and ruggedly constructed; in fact there's nothing to get out of order, and they are absolutely foolproof.

Write for Bulletin 349. It gives complete details.

A Nationwide Survey of Our Milk Supp

Government Authorities Will Summarize Conditions in All Cities of 10,000 and Over as Related to Tubercular Infection of Cattle

By A. M. LOOMIS*

A SURVEY is to be made during the next three months by the government agencies interested in the protection of public health from tubercular infection and the cleaning up of the dairy industry from tubercular cattle. Co-operative arrangements to make this survey have been agreed to by the United States public health service, the bureau of animal industry and the bureau of dairy industry. The purpose is to place in exact form a statement of the progress which has been made in the past few years in the public control of the milk supply, with reference to tubercular testing of cattle and the pasteurization of milk.

A survey of this character was suggested by the American Dairy Federation in a resolution which was adopted early this year by its executive committee, which called attention to the large number of cities and villages which had adopted such ordinances. The American Dairy Federation pointed out that these activities for the protection of milk supply and public health were the best and most important evidences of the growing public demand for the complete eradication of tuberculosis among dairy cattle. It was further suggested if a complete statement beyond any controversy c be presented to the committee of congress which han the appropriations for the tuberculosis work it woul the most convincing presentation which could be m

The public officials most concerned, as soon as were informed of the action of the American Dairy eration. expressed their interest and their willingnes immediately take up the proposition of a nationw survey. Several conferences were held in which offi of the bureau of dairy industry, bureau of animal in try and public health service most concerned with progress of tuberculosis eradication and the contro tuberculosis in the human beings took part, and a and a form of inquiry was worked out and agreed u This plan, briefly, is as follows:

An inquiry blank has been prepared which wil distributed first by public health service to the he officials in all cities of 10,000 inhabitants or over, w there is a public health representative. This incl most of the large cities in the United States. Secon

Oakite makes all cleaning easier

Are you getting maximum value from your cleaner?

A simple comparison will soon tell you. For example, how many times can your cleaner be used before its cleaning action is finally spent? Just once,—or several times?

Several times, if you are using Oakite. In dairies where cleaning is done the Oakite way, solutions of Oakite are often used two or three times. First for cleaning bottles, preheaters, pasteurizers and other equipment. Then again for general cleaning: floors, walls, ceilings, and similar surfaces. In one large dairy where this is done, a tank has been installed purposely for storing the used Oakite solution so that it may be available for general cleaning.

Other money-saving advantages of Oakite are fully explained in our illustrated booklet "Oakite in Dairies." A copy will be sent for the asking.

Oakite is manufactured only by
OAKITE PRODUCTS, INC,, 30B Thames St., NEW YORK, N. Y.

OAKITE
TRADE MARK REG. U. S. PAT. OFF.
Industrial Cleaning Materials and Methods

will be distributed by representatives of the burea
animal industry who are engaged in the tubercu
eradication campaign, to the public health officer
cities and villages of less than 10,000 people which h
any control over their milk supply.

It is believed that this plan will secure a definite
port from practically every city and village in
United States which has a milk ordinance, showing
how much protection is now required for the consum
milk against tuberculosis infection. It will be noted
those communities requiring all tuberculosis-free ca
will be listed in one column, those requiring either tu
culosis testing or pasteurization will be listed in a sec
column, while those requiring both tuberculosis tes
and also pasteurization will be listed in a third colu
Cities and villages which do not require any of t
protective measures are listed by themselves.

One official in each state will collect these rep
summarize them and then send both the original rec
and the summaries to Washington.

Dr. J. A. Kiernan of the tuberculosis eradication
vision of the bureau of animal industry will have
principal charge of this work with Dr. L. B. Ernst of
tuberculosis eradication division, Ernest Kelly, ma
milk specialist, of the bureau of dairy industry, and
Leslie Frank of the public health service as the execu
officers of these three bureau in the co-operative work

The bureau of animal industry made a survey i
somewhat similar form considerably over a year
taking several months for the work and considerable
ditional time before the summaries were comple
That survey brought out some very valuable resu
showing a surprising increase in the number of c
munities which had taken up the matter of protect
the consumers from the possibility of using milk f
tubercular cattle. The plans for the present sur
grew out of the experience in the previous one and
need and importance of having the very latest and m
reliable information ready to present to congress whe
next convenes.

The officials of the three bureaus most concerned
very desirous that the dairy industry shall co-ope
and assist in this survey, particularly the milk dea
and the organizations of milk producers. These pu
officers are cognizant of the rapidly growing demand
the cities and villages for tuberculosis-free milk,
they are also familiar with the hardship placed upon
producer when this demand is insisted upon before
producers are prepared to meet it. They also un
stand very well that the producers of milk can not
their herds from tuberculosis without great financial
unless the federal and state appropriations necessary
pay the indemnities for the cattle which are slaughte
are ready and large enough to meet the requireme
That is, the whole structure depends primarily u
adequate indemnities. The most important work w
can be done now is to present all of the facts to cong
and to the state legislature so that their action will
lag behind in this movement to safeguard the pu
health and improve the economic and health conditi
in the dairy industry.

Most of the survey work will be done in August
September. Every effort is to be made to have the c
paign summary finished by the first of November.

More Trips Per Bottle Thatcher's Guarantee to You

THAT'S what most dairymen are looking for—more trips per bottle, because the more trips a milk bottle makes the greater profit the dairyman makes. Thousands of dairymen are getting that greater profit by using Thatcher Bottles because Thatcher Bottles give "more trips per bottle."

That Thatcher Bottles give at least five more trips per bottle has been proved by exhaustive tests as well as by the actual experience of thousands of dairymen throughout the country.

Thatcher Bottles are made of only the purest flint glass, perfectly tempered in scientifically designed lehrs and are extra reinforced at upper edge, shoulder and base edge, the most vulnerable spots of a milk bottle. Thus Thatcher Bottles are stronger, tougher and give more trips per bottle.

The Thatcher Trade Mark is blown on the base of every Thatcher Bottle and is your guarantee of flawlessness. And Thatcher national advertising has helped many dairies build bigger profits. It will pay you to use Thatcher Bottles and tie up to Thatcher advertising and to use the valuable advertising material that is furnished free to Thatcher users. Mail coupon today.

KREM-KO

SERVE
ICE COLD OR PIPING HOT
KREM KO
CHOCOLATED DAIRY DRINK
9 FL OUNCES
KREM-KO CO
CHICAGO
PATENT PENDING

The improved and perfected chocolate dairy drink.

Can be bottled by any good dairy.

Keeps, without icing, in any weather.

Always uniform; always sweet and pure.

Chocolate doesn't settle or thicken.

A big seller and a big repeater everywhere, through drug stores, fountains, road stands, restaurants, amusement parks, groceries, pool rooms. (Or through beverage jobbers.)

WHO WILL OWN THE KREM-KO RIGHT IN YOUR TERRITORY

When writing to KREM-KO COMPANY *please mention The Milk Dealer.*

A Real Profit Opportunity for you Mr. Dairyman!

Here's a demonstrated profit-making opportunity for the dairyman who knows a good thing when he sees it.

KREM-KO—the improved and perfected chocolate dairy drink—has captured Chicago and other points by storm.

It's just the drink bottlers have wanted for years—a real creamy drink with a most wonderful milk-and-chocolate flavor.

Every obstacle you may have heard of in the preparation of a milk-and-chocolate beverage has been eliminated by the KREM-KO process.

To one reputable dairyman in each community we now offer the rights to the KREM-KO process, to the KREM-KO name, to the KREM-KO advertising formula that guarantees successful introduction.

Franchises are being issued. If you want to learn about the profit possibilities of the KREM-KO proposition, fill out the coupon, or write or telegraph.

KREM-KO utilizes skim milk, KREM-KO syrup, cane sugar, and the KREM-KO process. It brings a handsome profit—retail trade and public are educated to paying more for a milk-and-chocolate drink.

We offer you our counsel in production, distribution, and advertising—based upon actual experience in cities of various size. In many communities, dairy operators may arrange to have the entire distribution of KREM-KO handled by beverage jobbers.

Don't delay. Learn how the manufacture of KREM-KO takes out the slack from your organization, utilizing the time of equipment and personnel, that is now wasted.

It's a winner—start NOW!

KREM-KO COMPANY,
4830 Turner Avenue, Chicago.

I'm willing to be shown! No obligation on my part—of course.

The Finest Drinking Milk

comes from those dairies *that* HOOD-SEAL *the bottles*

A VERY special milk service is offered you by one or more leading dairies in your city. A service that has done more to insure you pure, clean, full-flavored milk than all other agencies combined.

You can easily identify these dairies by the Hood-Seal they use on their bottles of better drinking milk—the paper hood locked on by the wire ring.

Leading producers of better drinking milk use this wire locked Hood-Seal. Dairies like Sheffield Farms and Borden's in New York, H. P. Hood & Sons and Whiting Milk Companies in Boston, were the pioneers of this clean sealed drinking milk idea. They are the largest distributors of sealed Grade A Milk in the world. Now more than two thousand other leading dairies in leading cities all over the United States and Canada have adopted this sealed Grade A drinking milk service.

The Hood-Seal is more than a perfect, sterile seal against contamination. It is a symbol of the tremendous efforts these progressive dairies have made to insure you clean milk.

For up to the moment the Hood-Seal is fitted over the bottle, a great chain of super-sanitary measures has taken place. Each for one sole purpose. Better drinking milk.

All their work would be in vain if the milk were not delivered to you just as wholesome and clean.

To safeguard this, they all adopted a seal for the bottle. And they chose the sterile paper hood locked on by the wire ring. Last year over four hundred million Hood-Sealed bottles were used.

Milk is so essential to good health that more of it should be included in the daily menu. With the better, richer flavor of Hood-Sealed milk you will find new delight in drinking milk. You owe it to your children to have this better drinking milk always on hand.

Write for illustrated book on Milk. It tells all about better drinking milk and how it is produced. It is sent on request by Standard Cap and Seal Corp., 1200 Fullerton Ave., Chicago.

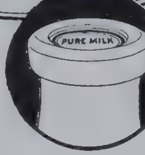
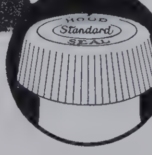
Throughout all New England leading dairies in the principal cities and towns have long Hood-Sealed their Grade A and Special milks. This is true with such prominent distributors as Hood & Sons and the Whiting Milk Companies in Boston and more than 150 other progressive dairies in these states. The same is true wherever you go; in Washington, Buffalo, Chicago, Los Angeles, Toronto, Montreal, Miami, Seattle, Kansas City, Cleveland—the wire locked Hood-Seal is your faithful sign of better drinking milk.



First an inner disc cap is placed on the bottle. This cap is sterilized because it comes in direct contact with the milk or cream.



HOOD

Edison Batteries increase truck revenues

BECAUSE of the light weight of the Edison *steel* Battery, a company operating 75 trucks in two eastern cities has replaced all other batteries in electric delivery service with Edisons (all other batteries of commercial importance except Edisons, are lead batteries). The trucks have been equipped with larger bodies and the pay-load capacity has been appreciably increased.

This change in the type of battery used was the result of many years' experience with both lead and Edison Batteries.

Each truck now serves from 16 to 24 more customers and brings an increased revenue of from $28.00 to $40.00 per trip!

Edison Batteries have many advantages. Light weight is but one. Ruggedness is another. They regularly sustain road shocks and accidental rough usage that would injure or ruin any other battery. They are more dependable. Maintenance is lower, and long life notable. We will be glad to lay before you a certified report on this installation. Ask our nearest local office.

HAUL MORE FOR LESS MONEY

E LABORATORY AS A SALES PROMOTER— SALES RETAINER.

S. L. Wise, Chevy Chase Dairy, Washington, D. C.

great step in the advancement of the scientific in- y, "dairying," was the realization of the necessity he laboratory as a medium in the sanitary produc- handling and scientific control of milk and cream its source to the ultimate consumer. In this regard lairy laboratory is not only a protector to the in- ual organization, but also a necessary assurance to nilk consuming public, and every possible precau- is being taken to protect and to serve them at all with nothing but the purest and most wholesome uct humanly obtainable. The value of the labora- from this standpoint has been realized by the ma- y of the milk dealers today.

ow many dealers have given the thought of utiliz- their laboratory as a sales promoter and sales re- r, and how may this be possible? The laboratory tors should not only be well versed in all phases acteriology but should also have a knowledge of ical science insofar as milk and its products are erned; that is, a knowledge of usual ailments and ases for which milk is of great importance from the dpoint of therapeutics and dietetics.

ow frequently have some of your customers called ritten for information or even advice concerning above, and has anyone in your employment been iently prepared to answer correctly and with as- nce? If this has been possible you have not only sed your customer but you have obtained the best ble source of advertisement, namely the housewife. ugh this medium the laboratory has become the e of sales promotion.

ow may the laboratory be utilized as a sales re- r? Every dealer in the dairy industry has un- tedly and will continue to receive complaints rela- o the poor quality of the products or the differences ur product as received from time to time.

hese complaints when received and adjusted by the ral office should immediately be forwarded to the atory and upon receiving the complaint at the lab- ry the laboratory director should immediately re- his records of all analyses made on the day the uct was handled and bottled. If possible a sample e product should be obtained from the customer and lete analysis should be made of same, and the cus- r should be informed as soon as possible regarding esults of the analysis.

his interest shown the customer will not only please rom the standpoint of personal attention, but will create a most favorable impression in the mind of customer, being assured that no matter how small w large the complaint may be it has been given diate and thorough attention from every angle. service to the customer will in 99 per cent of the convert a dissatisfied customer from a knocker to ster. Once this service has been practiced the or- ation will immediately realize a vast decrease in umber of stopped customers, and an increase in ustomers over and above the regular solicited new ess. The extra cost of this service undoubtedly will paid two-fold for the value received therefrom.

FLAVORS in MILK

Their Causes, Reactions, Preventions and Effect Upon the Trade and Consumption of Milk

By WM. H. E. REID, *Associate Professor Dairy Manufactures, University of Missouri, Columbia, Mo.*

Information
Distributors
Should Im-
:: part to ::
Producers

THE one great difficulty in producing market milk that will meet the demands of the consuming public is that of producing milk with a clean, desirable flavor. Under ordinary conditions milk invariably suffers changes in physical and chemical composition that render it unfit for human consumption and seriously impairs its market value. Particularly is this true where undesirable flavors are present. Not only does the consuming public demand that its milk be as free as possible from foreign flavors, so it will retain its keeping qualities for the longest possible time, but also the relation of the milk to public health, especially to the welfare of the infants and children, is greatly emphasized.

The milk industry has grown almost entirely from the empirical side, each producer learning from experience the details of the profession. In these days of intense competition the unsound methods and practices of producing milk of an undesirable flavor no longer has sway. Much knowledge has been acquired and much knowledge is to be learned in the production of suitable flavored milk from the standpoint of normal and abnormal fermentations that occur in the milk, the underlying principles which govern the detection and prevention of these defects and the scientific principles involved regarding suggestions for the possibility of improvement. Undesirable flavored milk is a curse to the industry and should be eliminated.

In the first instance, in discussing milk flavors, we have to deal with, first, the biological problems of the milk as affected by bacteria, and in the second place, the improper conditions to which milk is subjected as caused mainly by the absorption of flavors in a purely physical way, or due to some unusual condition of the cow.

The physical constitution of the milk is well adapted to promote the active growth of many living organisms, if they are once introduced into the milk. The nutritive elements are either in a soluble state or are readily converted into a condition that permits their absorption by bacteria. The lower forms of life such as bacteria, yeasts, and molds are the most common organisms which deleteriously affect the milk, and among these the bacteria are the most troublesome and most important from the milk producer's standpoint, because a large number of the flavors common in milk are caused by bacteria of some form. However, in a very few cases other forms have their effect, but their influence is not nearly so great.

Bacteria are so numerous that it is very difficult to prevent contamination of milk with them. While milk may be considered sterile when drawn from the udder, it invariably becomes contaminated with bacteria during the process of milking and subsequent handling.

In studying the types of bacteria that produce objectionable flavors in market milk there are several factors to be considered. The first is their action upon the milk and their relation to all who deal with milk, and their effect upon the persons who consume the milk as a food. Some bacteria that are troublesome to the market milk producer are very desirable to the consumer, but on the other hand, some bacteria that are injuri
to the producer are also injurious to the consumer. Th
bacteria are those that produce undesirable flavors.

There are those bacteria that are considered nor
bacteria and those which are abnormal bacteria. In
sidering bacteria from the market milk dealer's poin
view, some of the normal bacteria may be conside
abnormal to him.

One of the most common flavors produced in mil
that caused by acid producing bacteria. It is gener
considered a natural change in milk, but it has b
shown that the souring results only in the presence
acid producing bacteria. Especially is this true wh
the conditions of the milk and surroundings are fa
able for bacterial growth. The souring is the result
the production of lactic acid from the milk sugar
the action of certain bacteria. The bacterium la
acid is the most troublesome bacteria in this resp
The production of acid causes the milk, first to s
then as the acidity gradually increases, the milk curd
That is, the acid precipitates the casein, which norm
is in solution, in an alkaline or neutral solution. M
of the other forms of bacteria, such as streptococ
lacticus, bacterium acidi lactici, bacterium bulgari
and others also have their influence on the souring
milk.

This defect in milk is one of the difficulties the da
man has to guard against, especially in warm weat
Some bacteria can do their work most efficiently i
few hours where the temperature is warm, while ot
require a longer time. Besides producing gross cha
in milk, they render it practically unsalable.

Fermentations in milk are not always accompa
by the production of an acid. Quite often the
curdles quickly without the presence of any apprecia
amount of acid present. The milk may become c
ulated into a soft, slimy mass which usually cause
to acquire a bitter taste. There is no sour flavor pres
but instead the milk reacts alkaline. The curd
duced by the alkaline bacteria is easily distinguis
from that produced by acid bacteria. The curds
softer and more gelatinous than the acid curds. A
the milk stands for a while, the curd begins to diss
into a somewhat clear liquid, and if it is allowe
stand long enough, it may acquire an appearanc
being a semi-transparent liquid. It may develop a
ter flavor, which is due to the presence of ammonia.
organisms producing these quick curdling and diges
fermentations are, as a rule, bacteria that are associ
with fecal matter which find their way into milk
number of ways. From all indications it seems that
or more bacteria work together, one producing a re
like curd and the other a digestion or dissolving of
curd. There are a great number of flavors that t
bacteria can form, but they seldom do any harm.
grow slowly and the acid forming bacteria usually
the start of them and produce so much acid that
cannot develop. However, at the same time they
withstand high temperatures which make it imposs

Friendly Talks on the Important Subject of Sterilization

Conducted by
J. W. YATES
formerly Dairy & Food Commissioner, Health Dept., Kansas City, Mo.

Talk No. 10

Sterilization by Spraying
Its Effectiveness and Economy

Last month we mentioned the application of B-K to pasteurizing equipment by spraying. We give you now data on milk control from a plant so sterilized, under observation for three weeks. Composite samples were taken every morning and the counts of these samples taken before pasteurization as delivered at the factory. Following are the condensed results. Additional information desired will be furnished on request.

The results show not only a high reduction of bacterial count in the composite farm milk before pasteurization, but also the thoroughness with which B-K spraying sterilized the factory equipment, thus preventing possible recontamination.

Immediately before milking time, each farmer used the regular B-K rinse on all buckets, cans and other containers making contact with the milk at the farms, thus accomplishing a reduction in count of the composite farm milk from the high records close to the million mark, previous to using B-K, down to a minimum of 28,000 and a maximum of 125,000. These counts covered samples from every run through the three weeks.

At the milk plant, the only method of sterilizing the equipment was spraying with B-K the vats. pasteurizer, cooler, filler, etc., and a flowing B-K solution through pipes, valves and similar places not accessible for the spray.

The average of all counts in plant for the whole period, using B-K as the only means of sterilizing equipment, is as follows:

Condition of composite milk in vat before pasteurization	Sample No. 1	50,000
Condition of composite milk after pasteurization	Sample No. 2	1,000
Milk over cooler	Sample No. 4	1,000
Milk from filler	Sample No. 5	1,500
Milk from bottle	Sample No. 7	2,000
Condition of composite milk in vat before pasteurization	Sample No. 1	28,000
Condition of composite milk after pasteurization	Sample No. 2	500
Milk over cooler	Sample No. 4	450
Milk from filler	Sample No. 5	500
Milk from bottle	Sample No. 7	550

The actual cost of B-K was less than six cents per thousand gallons of milk, and the labor cost of applying it was seven cents per thousand gallons, the total being vastly less than the cost of applying steam.

Write us

We will be glad to advise you as to how to sterilize your equipment by this highly effective method.

to completely sterilize the milk by heat. They are
capable of growing at low temperatures and do t
share of ordinary fermentation in cool weather.

The gas forming bacteria are very objectionabl
market milk due to the fact that they produce ol
tionable flavors. They ferment the lactose of the
and form gases in addition to acid. The arogenes
ganisms form a greater quantity of acids and gases
the coli organisms, but the coli are more active in
protein decomposition. In the early stages of
change, the milk has a sweetish-sour flavor and
that is very unpleasant, especially when the arogene
working, but later the flavor may become unclean, w
the odor is stable-like, and finally the flavor bec
salty and the odor is like that of decomposing mar
Milk undergoing this fermentation and decomposi
is very undesirable for human consumption.

Milk sometimes acquires a strong cowy flavor,
milk having an appearance of soapy water. It ma
due to several causes. The milk from cows in the
stages of lactation may have a cowy flavor, which i
tributed to the relaxation of the gland tissues an
tration of the blood serum between the epethelial
of the olveoli. The flavor also occurs when cows
been incompletely milked at previous milkings, an
is claimed that the first part of the milking has a
ilar taste. In these cases it is thought that the ab
mal flavor is due to bacteria that enters the udder
tern. Certain staphylococci and streptococci and s
other bacteria of the coli arogenes group give the
this cowy flavor.

Slimy fermentations occur quite often in milk
ing summer weather, but less frequently during wi

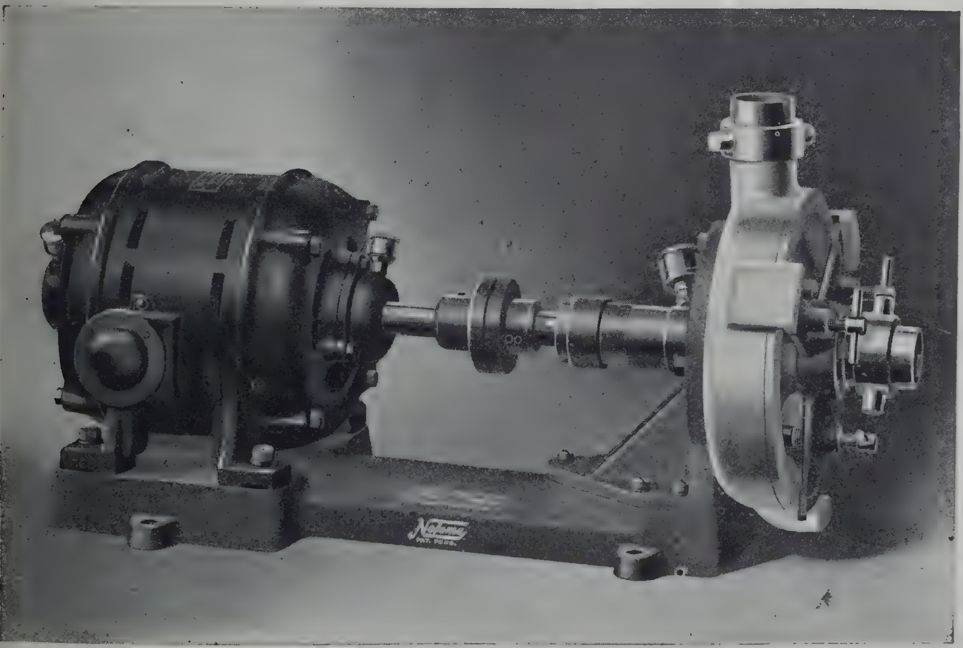
Nofome Sanitary Milk Pump



No churning, because the enclosed impeller carries the milk to full periphial speed without the vanes passing through the milk.

No foam because no air can enter the pump from shaft bearing, nor grease from the same source.

Milk passes through the impeller housing, but the vanes do not pass through the milk, which prevents churning and injury to the cream line.

Let us solve your Pump and Fitting Problems.

by peptonizing or casease bacteria. The bacteria
sometimes called liquifiers, and are the cause of p
faction that develop the off flavors. Usually they sec
two enzymes or ferments, which attack the proteids
pecially the casein. There are two specimens of
teria that produce the two ferments. When the re
producing bacteria are dominant, a white curd is for
and slowly digested. When the casease is presen
largest quantities, the curd is soft and flocculent
peptonization takes place rapidly. In the early st
the milk acquires a bitter taste, and later a foul, ch
or stale flavor and an undesirable odor. The prod
formed are very harmful to persons who consume
of this sort.

Sometimes milk may develop a soapy flavor whic
very unpleasant. Two species of bacteria (Bact. S
lacticum and Bact. Lactis Saponecia) have been pro
to be the cause of the trouble. They attack and br
down the proteids and fat in the milk which deve
the flavor. At first the milk seems to be normal,
later acquires a disagreeable taste of soap. The bact
are found in fodder and hay, and if cows are milke
dusty barns, these bacteria are likely to contaminate
milk.

Another source of soapy flavor, which is not bacte
is that which results from the improper cleaning of n
utensils, especially when soap is used. It is almost
possible to remove the soap film from the utensils, th
fore it should not be used.

Milk is oftentimes found to develop a turnipy fla
a fact that is usually attributed to cows eating turn
The explanation is that the flavor is produced by b
teria. If the flavor is due to cows eating turnips,
flavor will be present at the time of milking, but if
flavor is due to bacteria, it will not be apparent u
some time after milking and is consequently due to b
teria. The organisms causing the flavor have been fou
to be B. Lactis Footidius.

Bitter flavor is a common occurrence in milk and
ascribed most commonly to bacteria, of which seve
species have been isolated. Perhaps the most comn
cause of bitter flavor in milk is the presence of pepto
and albumoses, which are formed from proteins by b
terial action. Liquifying cocci are the most comn
agent. They are difficult to eliminate from milk
to the fact that they can withstand the heat applied
milk in pasteurization and pass into the vegetative st
and grow. They digest the casein and produce the
ter taste. Some of the peptonizing bacteria grow
relatively low temperatures at which lactic acid bacte
grow but slowly, and therefore the lactic acid bacte
do not inhibit the growth of the digesting bacte
Where butyric acid is formed in milk, a bitter taste
often noticed, and in heated milks the flavor is someti
noted. Some of the organisms that have been fou
to produce the bitter flavor are: Micrococcus la
amari, Troula amara, and any member of the coli a
genes group that break down or decompose the prote

In some cases the cause of bitterness is traced
yeast. It is found on leaves of trees generally.
other type of bitter milk of less importance to the m
ket milk dealer is bitterness caused by the action
steam for sterilization purposes. Most of the bacte
are destroyed, and the milk will keep for a long ti
and finally become bitter, which usually increases w
age to a degree that makes it unpleasant to the ta

The rancid flavor in milk is due to the same con
tions as milk with a cowy flavor, which is the result
the growth of butyric acid bacteria.

Prof. Burke's Inquiry -:- Department -:-

This Service is Free to Readers of The Milk Dealer

Inquiry from B. M. Co.: You helped us on cottage cheese so we'll call on you again. We still have from 50 to 100 gallons of skim milk each day that we don't know what to do with. Our town is 5,000; our milk customers about 1,000. We now sell milk, cream, commercial buttermilk, chocolated milk and cottage cheese. We would like to know what we could do to get some profit out of this extra skim. How about Swiss or skim milk cheese or semi-solid buttermilk or powdered skim milk?

This extra skim will not be regular but will vary from almost nothing in late summer to 100 gallons daily now.

We could leave the cream in most of it if we could profit more by it.

We have a 12-h.p. boiler but usually do not keep steam at night.

Reply: I am very sorry to be unable to answer your letter directly. As you failed to give your address I can only publish your inquiry and my reply in the hope it will be noted in time to be of some value.

You seem to be making a pretty good variety of dairy by-products, hence it is somewhat difficult to decide what to do with the extra skim milk. Have you ever tried making whole milk neufchatel or pimento cheese? You might work up a good trade for either of these since they are easily made on a small scale and require very little equipment.

To make the neufchatel: Pasteurize 30 pounds of whole milk in a shot-gun can at 140-145 degrees F. for 30 minutes. Cool to 80-85 degrees F., add one-half pint of lactic starter and then 8 drops of fresh rennet diluted in about 3 or 4 tablespoonfuls of water. Agitate thoroughly while adding the rennet. Set the can of milk in the ice box at a temperature of about 50 degrees F. over night. In the morning very carefully pour the curd onto fine meshed cloth and hang up to drain. Cheese cloth is too course for draining as the curd is very soft; however, I have sometimes used it double with good results. In pouring the curd onto the cloth be especially careful to avoid breaking it up any more than necessary. After the curd has been drained so that it breaks away easily from the sides of the cloth remove it from the draining rack, fold the cloth over it and place it between two boards, putting a weight on top to press it. If you have a cheese press handy so much the better. However, I have secured good results by placing the curd between two butter box covers and putting an ordinary bucket of water or several bricks on top. Press the curd until after about 4 to 6 hours it weighs 5.5 to 6 pounds. You will note this cheese is very mildly acid, soft in texture and exceptionally creamy. It should then be slightly salted. From the amount made and on the basis of the cost of the milk you can easily figure the price at which it must be sold.

To make the pimento cheese you may use the above product or you may use the cottage cheese. After removing the seeds and small black specks from the pimentos, grind them up finely by running through a meat chopper. Mix thoroughly with the cheese. One small can of pimentos, which I believe usually sells for 20 cents, is sufficient for 5.5 to 6 pounds of cheese.

In this discussion of cheese manufacture, I have used rather simple methods and equipment as I do not believe it would pay to purchase elaborate supplies for what your letter suggests is of temporary duration. I you find a good trade is being worked up I shall be g to supply you with all details of the scientific manu tur of these products on a large scale.

Another suggestion for the disposal of your surp skim milk is to sell it to a plant making condensed the ice cream trade. Other plans would be to sell t milk powder plant, an ice cream plant or make it up i casein. However, I suggest you will not find the lat very remunerative.

Pennsylvania.

Dear Sir:—We have observed that our pasteuri milk of about 3.5 per cent butterfat, while it has a cre line that does not vary much from that of our co petitors', appears very thin and bluish below cream li

When emptied from bottle customers claim that l milk on bottom is unusually thin.

We pasteurize at 145 degrees and cool it in our p teurizer to 125, then cooling it down on tubular coo to about 40 degrees.

Can this be remedied and how? What is clarif milk?

Reply: I am sorry to learn of the trouble you a having with "blue" milk. Early in spring, followi the long winter period on dry feed, cows usually secr a milk rather bluish in color, this because the fat co tains very little yellow pigment called "carotin" whi is obtained from green feeds. As soon as pasture l comes available the trouble disappears. Over this f tor you have no control and the producer can overco it only insofar as he is able to simulate spring and su mer feeding conditions.

Another contributing cause is too efficient separati of cream from milk. This you can remedy to some e tent by preventing a complete rise of fat on the mi thus keeping more of it in the skim milk to produce t color. There are several things you can try, some which will add slightly to the cost of bottled milk wh others will effect it in the manner mentioned. I su gest you try the following:

Method 1.—Pasteurize and cool your bulk milk usual and to it immediately after cooling, and just pri to bottling, add 20 to 30 per cent of pasteurized mi previously prepared as follows:

1. Quickly cool to 40 degrees F. and hold some pa teurized milk in storage at 38 to 40 derees F. or low for about three to four hours, or until it **creams.** Th **agitate** to remix the **cream** and to it add enough crea to raise the fat test about three-tenths to one-half p cent (0.3 to 0.5 per cent). Mix thoroughly.

This, you will note, is planned to give a good crea line and at the same time leave considerable fat remai ing in the skim milk to make it look yellow, the reas being that recreamed milk never creams as thorough as milk on which the fat is allowed to rise only on and is not remixed. The slight addition of cream w not add materially to the cost.

Method 2.—Three or four hours ahead of time s some cooled, raw milk in storage at 38 to 40 degrees to cream. When your bulk raw milk is added to the v add to it 20 per cent by volume of the creamed ra milk. Pasteurize as usual and cool. If this noticeab decreases the cream volume on the bottled milk you c add to the next day's output a very small amount pasteurized cream.

Method 3.—Pasteurize all milk as usual at 142 d grees F. for 30 minutes, but instead of cooling in the v to 125 degrees F. continue the cooling to 90 or 100 d grees F. with the coils operating. Then run over t cooler. This process, while giving a fine flavor, tends

break up the fat globules causing more to remain in
skim milk. It also may cause a slight cream plu
form and will decrease the cream volume on bot
milk. However, this latter you can overcome by ad
a little cream as above.

You could try heating a little higher, say to 147
grees F., but not above, with more agitation in the
teurization vat but this would undoubtedly affect
flavor as well as the cream line. I do not believ
would prove satisfactory.

Now, as to a clarifier. This is simply a mechan
strainer and works on the same principle as a separa
except that it does not separate milk. It operates
high rate of speed and the centrifugal force throws s
ment and insoluble particles heavier than milk, to
outside of the bowl.

* * *

Illinois.

Dear Sir:—We are very much interested in the s
ject of the manufacture of commercial buttermilk,
will appreciate your opinion on the following questio

What is the object in heating skim milk to be u
in the manufacture of buttermilk to temperature ab
190 degrees? Is it primarily to kill off and weaken
desirable bacteria, or is it essential to control the b
of the finished buttermilk?

Our experience indicates that milk pasteurized
145 degrees, and then treated with a small amount
gelatine, will give a much better finished buttermilk,
desired body and marked resistance to wheying off.

Reply: The primary reason for heating the s
milk to about 190 degrees F. is to destroy as many b
teria in the vegetative state as possible.

There is a secondary reason, and that is the effect
different temperatures on the body of the butterm
For example, if skim milk be heated to 145 degrees
or slightly lower, and then cultured, the resulting c
particles are much larger than those in the case of m
heated to 180 degrees. In other words, as the tempe
ture rises the curd particles become more finely divid
and softer. The curd accordingly, breaks up easier
is more uniformly distributed. Also, after many
peated experiments, I have obtained a more viscous b
termilk and generally better results by using the hig
temperatures, thus corroborating the work of oth
Because of the effect of temperature on curd formati
it is customary to pasteurize milk for cottage che
making at 140 to 145 degrees F. rather than at hig
temperatures. The variation in size of the curd pa
cles of milks heated to the temperatures above listed
readily visible to the naked eye.

As to the use of gelatine in milk heated to 145
grees and cultured, I can not say, as in all my g
tinated buttermilk experiments, I have used higher t
peratures. Since gelatine is a protective colloid, ess
tially the same results may be obtained at 145 degr
with it, as at the higher temperatures without it.

Increase Your Dairy Profits

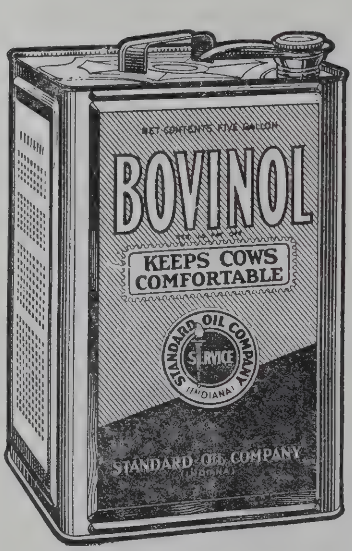
USE

BOVINOL

REG U S PAT OFF

You can increase milk production at least 10% by the consistent use of Bovinol! Agricultural experiments and practical dairy tests have proved it.

Cows waste energy fighting flies. Wasted energy means less milk. Scientists estimate that the energy used by an animal in fighting flies is equal to the food value of a pound of oats per head per day.



It will pay you to use Bovinol to protect your cows from flies. Flies may light on a cow sprayed with Bovinol but they cannot bite. They are smothered by the oil if they try it.

Care must be taken in applying Bovinol to cover every square inch of the hide. It can be done in less than a minute with the compressed air type of sprayer in which the oil is forced out by air pressure and is further atomized by an air blast. Spray against the direction of the hair so that the Bovinol will penetrate the coat.

Bovinol is a colorless, stainless and tasteless oil. It will not contaminate the milk, for it has no odor. It is non-poisonous—will not injure or irritate the hide. Spray your cows twice a day with Bovinol if you would increase your dairy profits.

BOVINOL

room to get the temperature low enough before bottl What else can be done to improve it? Shall we put s Viscogen in it, and how do you make it and how you use it? Our coffee cream is fine. No kick since pasteurize and cool immediately.

Reply: Pasteurize the fresh whole milk as soon received. Then, instead of separating, cool as qui as possible to a low temperature—preferably 38 to degrees F., and hold at this temperature for not than four hours. It would be better if you could hol at 38 to 40 degrees over night. Now warm to 85 to degrees F., no higher, and separate. Follow this quick cooling to 40 to 45 degrees F. Standardize age at this temperature for 24 to 36 hours.

The trouble you are having is caused by a lack sufficient viscosity, which is due to separating as soon the milk is pasteurized. This causes dispersion of fat globules. Following the above procedure cause clumping of the fat globules which experiments h shown is one important requirement for viscous cre

One thing about standardizing; I suggest you try separate a 36 to 38 per cent cream and standardize 33 to 34 per cent as this will eliminate the addition very much milk. It is not necessary to sell a 36 per c cream for whipping, as even 30 per cent will give g results when the product is handled in the proper m ner to produce viscosity. However, the richer the cre the thicker the whip.

I would not advise the use of Visogen, since m states prohibit its addition to milk and cream. It sugar of lime, and is made by mixing lime with a su solution. It is easily prepared, and if you desire formula I shall be glad to send it. However, since i readily detected in milk and cream and may alter flavor if added in too large quantities, I feel certain will not care to make it.

* * *

New York.

Dear Sir:—Could you furnish us with some infor tion regarding the cooling of milk after pasteurizati or advise us where we could get a reliable opinion the subject? We realize opinions along this line va

We are at present cooling our milk to 38 degrees before bottling, and keep our refrigerator at about degrees. We have been advised that if we would k our refrigerator at a little higher temperature, not c ing our milk so much, we would have better results to filling and cream line.

Reply: Many factors influence the creaming of p teurized milk. I would not suggest that you keep refrigerator temperature at any temperature above degrees F. A higher temperature would favor m rapid souring and the formation of a cream pl Numerous experiments in milk plants have shown t low storage temperatures favor cream line developme Therefore, you should cool the milk as quickly as po ble and hold at about 38 degrees F. as you are doing

There is undoubtedly some other cause of failure get cream line. You do not mention what temperat of pasteurization you use nor how you cool; I sugg you do not pasteurize at a temperature above 143 grees F., nor less than 140. Also, in cooling it is best use some form of surface cooler rather than to atten cooling in the vat. If you cool in a vat I suggest y use as little agitation as possible between the tempe tures of 115 degrees F. and 60 degrees F. Just agit barely enough to keep the cream from rising. If y are partially cooling in the vat it is advisable not to c any lower than 120 degrees F. before running over

cooler. The reason is that fat globules are broke and injury to the cream line occurs more quickly at peratures between 115 and 60 degrees F. than at other temperatures.

If the above suggestions do not enable you to ol a good cream line I shall be glad to have you writ in detail the method of handling the milk, and I sure we can overcome the trouble.

◆

TRADE PUBLICATIONS HAVE IMPORTANT SH IN BIG PROGRAM OF PUBLICITY.

One of the largest and most comprehensive adve ing programs ever undertaken by any truck manu turer has just been announced by the Federal M Company of Detroit.

While all forms of advertising are to be used, tr publications have a prominent place on the list of m ums. The leading trade magazines in twenty field industry have been selected. The Milk Dealer chosen to carry Federal advertising to the milk trad

"Vocational publications are logical mediums Federal and for other advertisers who wish to reac special group with a large potential buying power," John M. Howard, advertising manager for Federal.

"We wish to place our message before the most gressive type of business men and the largest buyer motor trucks in each of the major truck markets. Tr magazines go to just this kind of audience, and for reason we will use full pages in the ones that we have the most adequate circulation and a high stand in their respective industries.

"This is a comparatively new field for Federal vertising, but, with our new line of fours and sixes— most complete in Federal's 17 years as a builder trucks exclusively—it is our conviction that trade j nals are indispensable to our future plans. We are using national magazines, newspapers, outdoor pos and direct mail, thus bringing into action all th mediums which are so essential to a well-rounded comprehensive merchandising program."

◆

NOT SO BAD.

Ashland, Ky., July 19, 1927.

Editor The Milk Dealer:

We note with interest that one patron of the M ford, Wis., creamery received a check for $254.90 two weeks' cream.

We have three farmers who received over $200 three who received over $300 and one who recei $927.85 for the first half of June and $910.70 for the half of June and $975.80 for the first half of July. T is for whole milk.

That's not so bad for old Kentucky, way down Sou Most of these farmers have only been producing ab five years or less.

We are a little slow starting but watch us grow.

Very truly,
ASHLAND SANITARY MILK C

NEWS FROM THE CAMP.

Chicago, Ill., July 25, 1927.

Editor The Milk Dealer:

President Wanzer has just returned from the camp bubbling over with enthusiasm and making all arrangements for a return engagement.

We have received a number of inquiries about our bridle paths and riding horses. This service will be installed this week. Tell this to the wife and daughter. Have them take the well marked trails through our shady forests. How they will enjoy the rides; and tell them not to frighten the deer as they are becoming very tame. MY, what an appetite you will bring in from a canter through the pines to our airy dining room.

Here is a report from Geo. Wieland, who stayed a week longer than he planned and he says that it is typical of life at the camp.

Well, Little, you want my opinion of the camp. Here is our first but not our last experience at the camp:

We are originally Missourians and typical of the "old show me" class, so we decided to find out whether those rosy pictures of the dairy playground were true.

Our plans were well made and one evening my wife and daughter and a friend of mine and his family, after making our advance registration through the secretary's office, boarded the C., M. & St. P. fisherman's special at 6:25 at the beautiful Union Station in Chicago, and were on our way to be shown. Our ride put us in pretty good spirits because we found a nice train, splendid service and a wonderful dinner in the diner. Arriving at Minocqua at 7:05 the next morning, we were ushered into one of the most luxurious motor coaches that we think we ever had the pleasure of enjoying. This took us on a speedy ride over wonderfully paved roads through some of the most scenic woodland that it has ever been our good fortune to behold, past beautiful lakes, woodlands, with deer and elk standing in state reservation parks with wonder and awe at our approach. After about an hour of a seemingly all too short ride, we arrived at Boulder Junction where we were met by the association car and Mr. Ashton, a most charming and amiable gentleman, who seemed to make us feel that we were the only ones that they were expecting. Another beautiful drive through Wisconsin forests and we are entering the playground property past stately evergreens, birch and hemlocks.

What a joy to be alive!

In a few more moments and we are in the midst of the camp's beautiful log cabins and to our right and left is a group of our dairy friends greeting us and welcoming us on every side. We are in high glee to be there. Beyond us rose the beautiful silvery Big Crooked Lake on which we could see a number of the boys casting for the ever elusive musky and bass.

As a big boat slipped down to the landing just at this moment, so did our business and worldly cares seem to slip away from our shoulders. We paused just long enough to take in a bird's eye view of the cabins all around us and Mr. Ashton, with the ever-willing help of our friends, took us to one of the most beautiful cabins we have ever seen, brand new and newly equipped, scrumpulously clean, comfortable and inviting. Surely, what more could be desired? Here we are with nothing to wish for.

We lost no time in getting into our bathing suits to join the very happy bunch at the beach, not more than a dozen steps from our front door—here we go, splash, splash. OH BOY, why didn't we come before? Why did they only tell us half the story? What a wonderful warm, soft, sandy beach. What a joy to see the kiddies scooting down the slippery slide into the water. Everywhere not a care. We could stay in here all day but there are other things to do. Now to get a shower and into our camping clothes.

First for a canter through the woods, 315 acres of God's own virgin forest where all the trails are so well marked that there is no chance of getting lost. We could not leave this beautiful spot until time for lunch. Back we are at noon. There goes the dinner gong. Sure it was music to our ears.

Another beautiful sight burst into our vison. We wandered into a rustic, new, airy, sunlight dining room, decorated with trophies of the north woods, the tables covered with spotless linen—alert and ready to serve, are the dining room girls, dressed fresh as the woods themselves and OH, the meal. No wonder it cannot be described.

Now we unpack our fishing tackle, while the ladies take a saunter down through Cathedral Lane, up to the clea
for our proposed golf course, a trip through a veritable
land. We cast until we know it is time for the di
gong. How we hate to go in; but we have our full
catch and game laws are game laws in Wisconsin. Afte
noon meal, we thought we never would want to eat a
but the dinner gong found us ready and willing as be
If we were surprised at the noon luncheon, we were am
at the dinner. After the evening meal and a view of
grounds and other cabins, the "gang" got together at
Casino and enjoyed the radio, games, and the moon
on the lake. Before dusk the ladies and children enj
the outdoor pastime of finding the deer along the
through our mammoth telescope. Where has the eve
gone? It is time to go to bed and we are loath to d
even though we are so blamed tired. We all pile into a
mon's bed with snowy sheets and downy pillows. OH
home was never like this. We feel that for the rest of
summer that if business interferes with this pleasure
will do without the business. It is not long before we
unconscious.

It may seem strange to say, but fully refreshed we
earlier than usual the next morning and we beheld somet
we had not seen for years—an early morning sunrise. Not
could be more beautiful. Nature surely was trying to s
a special performance for our benefit.

We barely had time to wash and dress for breakfas
answer to the first gong. We had about exhausted our
lish for the luncheon and dinner but such a breakfast,
strange to say, we took it as it came. Fruits, cereals,
jacks, doughnuts, bacon and eggs, coffee, cream and
and the sweet girl waitress urging us to call for more.
next day we must change our fun some and take in a
golf at Trout Lake, which was all up to our expectat
Before having lunch, we took a hike over to Boulder L
Little Crooked Lake and Big Bear Lake, and then over
over again.

A couple of our party preferred to go for the rest ra
than the sport. Are they enthusiactic? I hope to tell yo
large, easy, luxurious chairs, deep, cool shade, an orche
of song birds. You know the camp is now a bird refuge
hike through Cathedral lane and the beautiful trails wa
the exercise that they desired. The rest of the time, c
cool, sweet relaxation, with possibly here and there a
story from our well stocked library, a saunter up and d
the walk, resting and swinging on the mammoth Ca
porch, and a day-time nap in the privacy of their own ca

Here we are back at home and wonder why we lef
soon. We are making another reservation for August, s
ing up a bunch of our friends. The half of it cannot be

⁂

RHODE ISLAND GOES UNDER STATE INSPECT RULE.

Rhode Island milk producers and distributors
under a state inspection regime July 15 which will
toward providing the state with Grade A milk at a
price to both the producer and the consumer.

Commissioner of Agriculture Harry R. Lewis an
four deputies will act as milk inspectors in the
to enforce the new rules. They propose to accom
the following purposes through the new plan. To
tect the consumer as to quality, quantity and health
ness of dairy food products in the state; to aid and
tect the producer in his desire to provide Rhode Is
with a high quality fluid milk; and to protect and
guard the distributor in the handling and mercha
ing of such dairy products.

It is their future plan to educate the consuming
lic as to the uses and care of dairy products, an
encourage more extensive use of milk.

n unbeatable combination for your plant—

The R&A *Rotary* Can Washer
The R&A *Soaker-Hydro* Bottle Washer

IF YOU want solid, clean construction without frills of any kind—if you want the kind of bottle and can washer efficiency that relieves you, permanently, of all worry about the cleanliness of your containers—if you want these features without the penalty of an extravagant investment—

Then give consideration to these two R & A Washers.

R & A Rotary Can Washers have always been dependable can washers. Any user will tell you that. And the R & A Rotaries of today are vastly improved in ruggedness, efficiency and simplified design; probably the only rotary can washers available that are built to meet the requirements of every Board of Health.

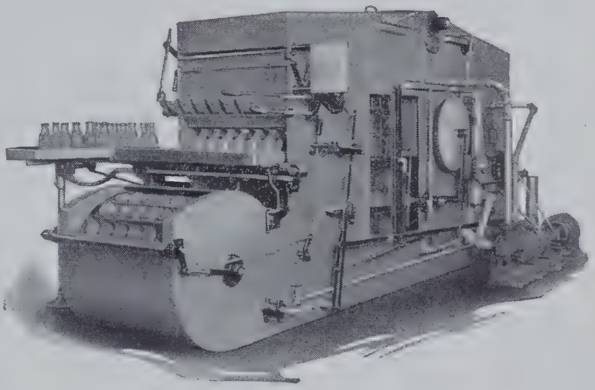
The R & A Soaker-Hydro Bottle Washer matches the Rotary Can Washer in performance and strength. Its highly efficient combination of soaking and hydraulic washes is so effective that we say to you: Buy it—try it. And if after thirty days you don't believe it measures up to every claim made for it, we will gladly take it back without argument. And, you can buy the four-wide for less than $3500 fully equipped.

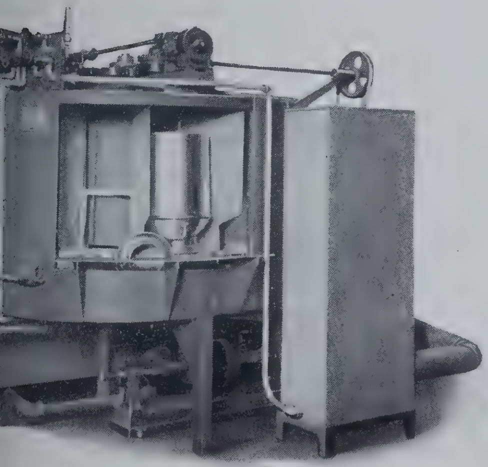
The R&A Soaker-Hydro

32 bottles per minute in the 4-wide, 48 in the 6-wide and 64 in the 8-wide. Every bottle gets a prolonged soak, powerful hydraulic solution washes thru pump, pump rinses and finally clear water rinses both outside and inside—

Feed and discharge at one end of machine; four rows of pockets always exposed ready for loading. Protected thruout by automatic safety-stops. Electrically lighted discharge and inspection. Simple, trouble-free, accessible and tremendously strong.

Less than $3500 for the fully equipped 4-wide model; and it invites comparison on construction and performance with any bottle washer on the market!





The R&A Rotary Can Washer

With this washer you get *clean* cans, *sterile* cans, *dry* cans; and if you want a clear conception of how wisely our engineering department has worked in designing it, send for specifications and go over them with your health department.

Covers are washed with the cans, and receive the same thorough cleansing, rinsing and drying. The whole machine is extremely accessible, and every part is built oversize to insure years of steady, trouble-free service.

As a progressive milk plant operator, you will be interested in the specifications on this machine. They're yours for the asking, and the obligation is all ours.

Please Note:—

All R & A Bottle Soakers are built under the basic patents of Charles E. Felt. —Also they can be equipped with hot-water sterilizers and coolers, if desired.

For your own satisfaction, before purchasing any washer, investigate these machines.

Milk Fed Men Make Better Washers

Workmen Get Regular Deliveries of Milk at World's Largest Washing Machine Factory

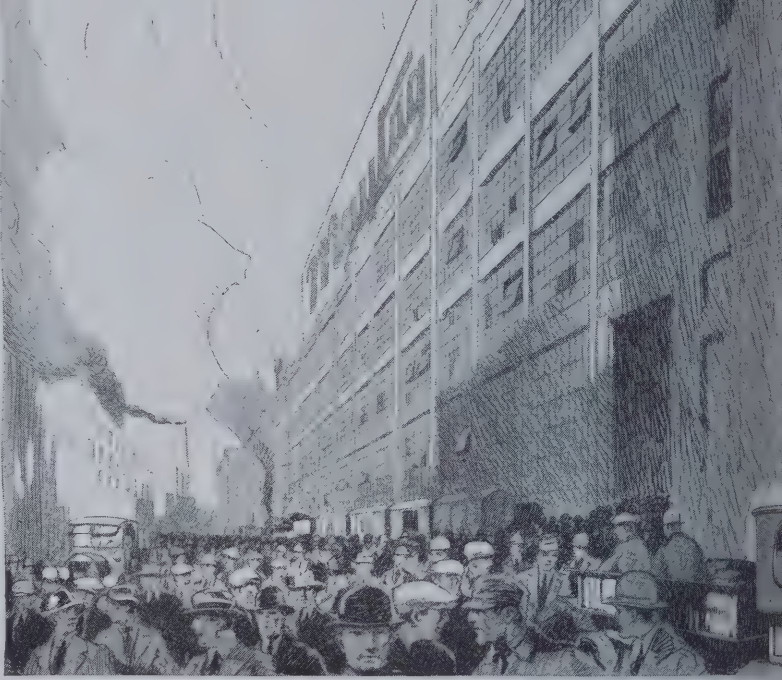
TWICE a day, in the world's largest washing machine factory, milk is delivered to the workmen. Each morning a large milk wagon arrives at the Maytag factory at Newton, Ia., and a thousand bottles of fresh, wholesome milk are placed in five large ice boxes stationed at convenient points about the factory.

In England, the men in offices have their afternoon tea, but here in America you have workmen "going them one better," by having their fresh, wholesome milk both morning and afternoon. This milk habit works to the advantage of the Maytag Company, as well as the workmen. It refreshes the men, enabling them to do better work, and it makes it unnecessary for them to leave their work to get refreshment. At noon the men are privileged to visit the ice boxes and purchase milk at the reasonable price of six cents a pint.

The big Maytag factory produces about 1,400 washers a day, more than one washer to every bottle of milk. Milk producers will probably want to know whether the production of washers increases in direct ratio to the number of bottles of milk consumed. However, since there are 2,000 workmen employed, it is safe to say that new recruits are continually climbing to the "milk wagon," and perhaps some day the daily requirements of the Maytag factory will reach 2,000 bottles of milk.

Not only is the Maytag factory equipped with the most modern machinery throughout, and working conditions provided which make for health and comfort, but the men are allowed privileges not commonly accorded to industrial plants. The new six-story factory addition and mammoth grey iron foundry are equipped with shower baths, dressing rooms, lockers and the most up-to-date plumbing. No expense is spared by the Maytag Company to make the working quarters comfortable, clean and modern.

E. H. Maytag, the president of the Maytag Company, is a farm product himself and that ma
the reason he appreciates the value of good milk to
vigor into milkmen, and perhaps his memory of a f
mother, inspired him to equip his world-renowned alu
num washer with a modern gasoline motor so tha
would be practical for farm homes without electric



GOLDEN STATE ENTERS MARKET MILK FIELD IN CITY OF SAN FRANCISCO.

Announcement has been made by the Golden State Milk Products Company of the purchase of the capital stock of the National Dairy Company of San Francisco. By the acquisition of this business, the Golden State Company is following the natural progressive evolution of its business as producer, manufacturer and distributor of milk and its products, which has resulted in its becoming the largest concern of its kind west of the Rocky Mountains. This is in line with the announced policy of the Golden State Company, of using its many plants, field operations and selling forces to the fullest extent.

The National Dairy Company is one of the old established dairies of San Francisco, having been formed by an amalgamation of certain pioneer milk concerns
1912. It has a substantial distribution of milk and cre
in San Francisco, and bears an excellent reputation
highest standards in its products.

NICOLLET HOTEL, MINNEAPOLIS, MINN.

he first Nicollet Hotel was built in 1857—in the last
of Minnesota territory status, and ten years before
eapolis received its charter as a city. The original
ere laid out by Colonel John Stevens in 1854. So
icollet Hotel historical existence is identical with
of the city of Minneapolis. The hotel was named
oseph N. Nicollet, a French explorer, who, during
to 1838, gave much valuable service to the state
United States government by collecting informa-
oncerning the natural history, as well as the condi-
of the Indians.

he general form of the new building, which was
d to the public on June 17, 1924, was determined
mensions and proportion of the lot. The site is an
lent one, commanding an unrestricted view across
iangular area known as Gateway Park.

e arrangement of rooms in a hotel is also governed
ly by the lot and its site. Consideration for the
, in regard to room and restaurant service, and con-
ation for the employee must be constantly borne
ind, together with such physical factors as stair-
, elevators and structural columns. In planning
Nicollet, the value of the ground necessitated the
vation of all street frontage for rentable area, with
xception of the space required for the entrances to
otel. The public space is concentrated on the main
the second floor and the basement. A long prome-
stretches from the entrance on Nicollet Avenue to
on Hennepin Avenue, and from this promenade, oc-
ng the central portion of the building, open the
lobby, the elevator lobby, the entre salle, the dining
and the coffee shop. The banquet and ballroom,
its assembly space; the private dining rooms, a
y parlor and a mezzanine lounge and writing room
y the greater part of the second floor. In the base-
are located the billiard room, containing a soda
ain and lunch bar, and the barber shop with a
' hairdressing parlor adjoining it. A public stenog-
r is located on the mezzanine.

e building is an imposing structure in the English
ssance style. It is a twelve-story structure, of red-
brick, with terra cotta trim and a stone base and
ourse. Its general character is one of simplicity
nting almost to severity. The interior of the hotel
so been designed in the English Renaissance man-
d provides a suitable environment for the clientele.

e main lobby is a spacious room of excellent pro-
ns, two stories in height, with a mezzanine gallery
d the four sides of the room. The walls are of
lly selected walut, rubbed with wax. The huge
ers are also of hand rubbed walnut, with bases of
valnut, excellent in workmanship and general ap-
nce. Molded plaster in an antique ivory tone com-
the ceiling from which are suspended two large
ng fixtures. Ample lounge and seating space has
provided in the lobby.

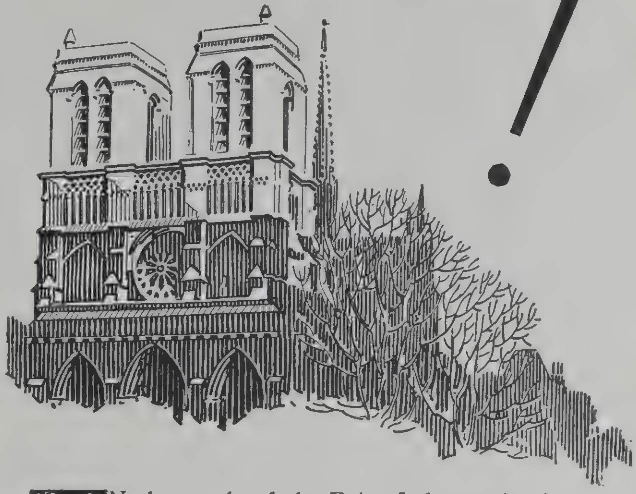
e woodwork is one of the most impressive things in
w hotel, and has caused much favorable comment
itors who know how seldom such quality of mate-
nd such exquisite workmanship are to be found.
ll the work of Aaron Carlson, Inc., and is a tribute
Carlson staff.

e Nicollet dining room is a work of art, so far as
and color are concerned, so that diners imme-
y are deeply impressed by their surroundings. In
ng with that delightful first impression, the service
ns everything that art as well as efficiency can

MAKE YOUR *CONGRESS*

a Pleasure Trip of

Europe!



IN the annals of the Dairy Industry the date "June 9, 1928," will be written in red ink! For that is the day on which American dairymen, their families and friends, will embark on a great adventure, which for many spells the realization of life-long dreams. From New York, the magnificent, luxurious steamer, the S. S. Leviathan, will carry us across the Atlantic to Cherbourg.

Our main mission in Europe is, of course, to attend The World's Dairy Congress, the greatest international convention in the history of dairying, which will be held in London, England, from June 26th until July 4th. Having crossed the ocean, we shall not want to return home without a glimpse of those lands we have read and studied about.

To this end the Congress has been arranged so as to allow time for a ten day tour before it opens, on June 26th. A glorious itinerary has been prepared by the American Express Company, which begins immediately upon our arrival at Cherbourg, France, on June 15th.

Paris? Paris—of course! That is our first stop. Then all through the smiling land of France. We visit historical Brussels. A trip of exceptional interest to us dairy men will be taken by steamer from Amsterdam, Holland, to the quaint Isle of Marken, and through Volendam, Edam and Monnikendam, the dairy and cheese-making country. This pre-convention tour terminates upon arrival in London, just in time for the first meeting of the Congress.

Interesting post-convention tours have been arranged, all moderately priced, with an eye to giving us the best in travel, in comfort, in enjoyment, and the most for our money.

There is one post-convention tour to Germany and the Scandinavian countries. Many of us have long wanted to visit there.

Another tour takes in Switzerland, the lofty Alps; sunny Italy; bewitching Venice; Florence, the city of art; ancient, historical Rome; Nice, the heart of the Riviera, where nobility and celebrities gather; Lake Geneva; and the dazzling, gay metropolis of Paris!

All information you may desire, such as dates, prices, etc., will gladly be sent you if you write to

The Olsen Publishing Company
501-515 Cherry Street Milwaukee, Wis.

AMERICAN EXPRESS

TRAVEL DEPARTMENT

furnish to make a meal there an event to be remembered. In George Osborn's Symphonic Dance Orchestra the new Nicollet Hotel boasts a dinner, dance and concert orchestra second to none.

Located directly above the dining room on the second floor is a magnificent ball room, measuring 52x180 feet, with accompanying promenade and assembly. The Nicollet banquet room can easily accommodate 1,000 persons. It is designed in the Georgian style, painted a silver gray, with wall panels decorated to simulate rose and silver damask.

The mezzanine writing room and lounge on this floor are developed in tones of old ivory, to harmonize with the lobby which they overlook. The large private dining rooms on this floor and the beauty parlor, also on this floor, are also charmingly decorated. The sample rooms occupy the remainder of this floor and are especially designed to meet the needs of salesmen who wish to display merchandise.

The remainder of the building is devoted to guest rooms, all with private or adjoining bath, and planned with reference to the placing of furniture. The walls for the most part are panelled plaster with applied wood molds. Here, as elsewhere, the dominant idea has been the welfare of the guest, and to this end every square inch of space has been utilized to the best possible advantage.

Steps were taken to properly care for families or for guests wishing one, two or three-room suites. Every home comfort has been provided for the guests.

The pleasure of one's stay in a big hotel is quickly made or marred by the operating personnel. The officers of the Nicollet Hotel, Inc., realized this from the first and spent long hours in studying men for the various executive positions. W. B. Clark, an able and experienced man, is manager; J. F. Carmichael is the well-liked assistant manager; Sidney I. Dellitt, known to everyone, and well liked by them all, is the chief clerk; Theodore F. Stelten is the room clerk and J. B. Bedford is the night clerk; Jean Vernet, a first-class cook and business man, is the chef in charge of preparation of all foods; John Hirsch is the maitre d'hotel under whom the dining room and banquet service is unexcelled, and Dr. Harold E. Hocum has as his duties the regular examinations of the health of all the hotel employees.

The officers of the Nicollet Hotel, Inc., are: A. E. Zonne, president; Joseph Chapman, vice-president; Glen S. Dixon, vice-president; Lyman E. Wakefield, treasurer; J. Cameron Jenkins, secretary.

Dairymen, you will enjoy this luxurious, comfortable and reasonable hotel.

MILK+GELATINE=HEALTHY BABIES.

There are proteins and proteins. The child
ticularly requires the correct quality. The additio
gelatine to milk works wonders, especially for the
dernourished child, according to Dr. Royal S. Copel
U. S. Senator from New York and former commissi
of health, New York City. He says:

"The nature, quality and food value of a given
tein depend on its own peculiar combinations of c
icals. If it contains sulphur and iron, or if it is ric
phosphorus or some other essential mineral, its contr
tion to the welfare of the body may be of unusual
portance. That particular protein may be capabl
producing growth and strength which some other
tein could not give, even if taken in enormous qua
ties.

"In feeding a child there may be given exactly
proper amounts of fats and carbohydrates, and, so fa
the scales show, there may be enough protein. But
less that protein is of the right quality, it does not
ply the material to give growth and stature to the c

"The bottle-fed baby may not thrive. The milk
its proportions seem perfect, but something is lack
What is it?

"In many such cases of undernourishment the c
and only cause of trouble is the lack of the special k
of protein necessary to satisfy the chemical needs
that particular baby. Small quantities of the right
of gelatine added to the milk may solve the problem

"It is perfectly amazing what a change takes p
when this is done. The gelatine adds to the benefi
effect of the milk, making it capable of meeting
chemical and physical needs of the undernourished ch

"With prepared milk alone there may not be nor
growth. Upon the addition of a small percentage
gelatine to the feedings the baby thrives like a gr
bay-tree.

"Some day the mysterious effects of the prot
upon the body-chemistry will be better understood. T
is for the future. But we may begin now to get the p
tical benefits which follow the addition of the gela
protein to the bottles of the undernourished child."

In order to combine the gelatine with milk, soak
level tablespoonful of gelatine in one-half cup of
milk taken from the baby's formula; cover while s
ing; then, place the cup in boiling water, stirring u
gelatine is fully dissolved. Add this dissolved gela
to the quart of cold milk or the regular formula. T
same proportions also apply to condensed or evapora
milk, upon proper dilution. The adding of gelatine
not necessitate the changing of the formula for infa
This should not be changed without consulting
physician.

WASHINGTON — MAINE

Notes From Far and Near

CALIFORNIA — FLORIDA

Camden, Ark.—H. G. Furloy opened an ice cream factory here recently.

Belvidere, Ill.—The Borden condensed milk plant here has been bought by the Dean Evaporated Milk Company of Chicago.

Center, Wis.—Shady Side Cheese Factory, Inc., was recently established with capital shares numbering 160, par $50. Its incorporators are: Gustave Henke, Wm. M. Wichman, Sr., and Fred Frahn.

York, Wis.—F. O. Justman purchased an interest in the York cheese factory from Leo Zehern.

Cedar Rapids, Ia.—The Wright Dairy Company, 1030 Mount Vernon Ave., has purchased the Otis Dairy Company, 227 Fourteenth Ave., according to the announcement of T. H. Wright.

Mitchell, S. D.—Armour & Co. have announced that a new $200,000 creamery will be added to the company's equipment here in 1928.

Rapid City, S. D.—Beginning July 8, the Superior Creamery Company is branching out in the milk business. A remodeled interior has provided more floor space. The company has contracted with Forsyth Brothers for the exclusive sale of milk from their pure bred Brown Swiss dairy herd.

Mt. Pleasant, Tex.—Represented by F. H. Chandler, Stephenville, the Texas Butter and Cheese Company have deposited a $5,000 cashier's check in the First National Bank as a guarantee to establish a milk plant here when a sufficient milk supply is assured.

Paris, Tex.—B. B. Harlan, local manager of the Boedeker Ice Cream Company, told the Paris Chamber of Commerce here of a plan to establish a creamery and milk products plant.

Marshall, Tex.—Phil. P. Taylor, B. Blalock, C. Jaynes, and J. J. I. Hey left for Tennessee and Mississippi towns to ascertain the possible benefits of milk condensery plants. The Marshall Chamber of Commerce is sending the local men.

Litchfield, Minn.—A meeting of stockholders of the Kingston Co-operative Dairy Association will be held soon to decide whether to increase the capital stock $8,500 and give authority to the directors to proceed with the erection and equipping of a new building.

Cadillac, Mich.—The dairy cow has ushered in a new reign of prosperity for Wexford county farmers, Kenneth Ousterhout, agricultural agent, told the board of supervisors recently.

Maysville, Ky.—Things appear to be favorable for the establishment of a plant by the Carnation Milk Products Company here.

Hornell, N. Y.—Excavation will be started soon for the erection of a twenty-five thousand dollar milk plant to be built by the Borden Condensing Company.

La Salle, Ill.—In one of the largest business deal
summated in Spring Valley this year, Mrs. Delaney purc
and assumed the interests of the Spring Valley Dairy
pany owned and managed by Anton Donges, veteran S
Valley dairyman. Mrs. Delaney is a pioneer in the
industry.

Mt. Pleasant, Ia.—H. B. England, who has formerly
connected with the Fankhauser Dairy Company, of this
has sold his share in the business to Messrs. Adolp
Charles Fankhauser and has purchased the Campbell
at Bloomfield.

Bloomer, Wis.—John Lang, one of the city's mil
pensers, has added a lot of new equipment to his milk
in order to give his customers a product that is in ever
clean and sweet.

South Boston, Va.—The Busy Bee Dairy, of whic
phonse Kritzells is the owner, suffered a $10,000 loss d
a fire.

Mechanicsburg, Pa.—The second annual Cumbe
County Dairy Show is scheduled to be held at Mountain
Park, Mt. Holly Springs, August 10 and 11.

Mt. Vernon, O.—The Gerhart Milk Company sol
to the Jewell Ice Cream and Milk Company, accordi
information received from a member of the Gerhart
pany.

Litchfield, Minn.—The Kingston Co-operative
Association has decided to build a new $17,000 crea
plant on a new site in Kingston village.

Marshall, Tex.—The Kiwanis Club has offered its su
toward the establishment of a milk condensing plant he

Portales, N. M.—The results of the campaign for
and better dairy cattle in Roosevelt County is easily a
ent during this season. The sales from dairy produc
the county are running $6,000 per week during the pr
season. This means the marketing of approximately six
dred ten-gallon cans of cream per week.

Taylor, Tex.—Frank J. Kveton, on route 5, Taylor, s
that he wants to see the proposition of establishing a
milk plant here put through. He is willing to put in
additional cows.

Annandale, N. J.—Frank G. Sharp recently installed
glass-lined pasteurizers in his pasteurizing plant. The
has been sold to Haines Brothers of Rahway.

Mercerville, N. J.—Eugene Wieland has recently inst
a small batch pasteurizer in his milk depot.

Massey Brothers Dairy, Granite City, Illinois

Payroll Leaks Reduced by Straight Line Operation!

DEAD or non-productive time so prevalent in the average Dairy or Ice Cream plant of a decade or so ago is a devitalizing leak which is being eliminated in the new plants planned and constructed according to modern engineering practice. Following the straight line operating system is a custom now observed with remarkable economy.

Reliable contractors in your own locality submit competitive bids from complete plans and specifications prepared for your individual requirements. When the contracts are let, successful bidder binds himself to execute them under the direction of our construction superintendent assigned to your job.

As important as any other factor which determines operative efficiency is that of economy in handling. The investment in equipment is definite while the investment in labor is so dependent upon the variable human element. It is possible, however—and practical—to co-ordinate the two that the completed plant will be a smooth-running unit free from non-productive time.

When you engage the McCormick Company, Inc., you are protecting your investment by obtaining the services of an organization experienced in the planning of Dairy and Ice Cream plants, whose first consideration is always economy in handling. This experience, with careful analysis and an intimate study of results over a period of years, has created a vast fund of knowledge upon which our determinations are based.

If you are interested in a new, or the modernization of your present plant, please feel free to consult us, as there is no obligation attached.

When writing to THE McCORMICK COMPANY, INC. *please mention The Milk Dealer.*

Producers Association of Central California will hold a meeting soon for the purpose of considering the building of a plant here for evaporating and canning milk.

Chowomella, Calif.—The Danish Creamery Association has done more to expand the dairy industry in this section than all other influences except that of the natural conditions. The association provides a home market for all the milk the dairymen supply and pays them semi-monthly for it. The association collects the cream and milk at the dairymen's door.

Medford, Ore.—C. L. Hoover, a local dairyman, spoke at the realty board luncheon recently and the gist of his talk was that dairying, which is now the second largest farming industry in Rogue River Valley, running around the $1,000,000 per year mark, is destined to climb to first place with a mammoth financial increase.

Buena Park, Calif.—William Wicker of Orange and Walker Streets, is erecting one of the most up-to-date dairy barns and plants in the northwestern part of Orange County.

San Mateo, Calif.—F. L. Kehoe recently sold the Burlingame Creamery to Sewell E. Bogart, prominent San Mateoan and owner of the San Mateo Creamery. The Burlingame Creamery is one of the oldest establishments in the city. Mr. Bogart has had much creamery experience.

Allenhurst, N. J.—Allenhurst Dairy Company has installed a Foxboro automatic signal device which warns the operator when the temperature has reached 142 degrees F.

West Portal, N. J.—C. Vanatta has just installed three glass-lined vat pasteurizers.

Oshkosh, Wis.—Corporation Counsel Mitchell, in an opinion given Dr. E. J. Campbell, city health commissioner, has declared he does not believe it within the jurisdiction of the city health department to investigate conditions on dairy farms located outside the city limits. He stated, however, that the department is entirely within its rights to take steps to secure the prohibition of the sale of unclean milk in the city.

Freeport, Ill.—The Freeport Standard Dairy Co., 213-217 S. Walnut Avenue, this city, is capitalized at $100,000 to carry on a general dairy business. The incorporators are John Vohlken, Emil Vohlken, R. J. Cridle, C. A. Steele, Roman P. Edler. Correspondent, Freeport Standard Dairy Corporation, 213-17 S. Walnut Avenue, Freeport.

Norristown, Pa.—With ambition to make Montgomery County the dairy county of Pennsylvania as an ultimate goal and to improve the standard of milk production as an immediate step, a new organization of Montgomery County cattle breeders and milk producers has been organized here. Edward A. Stanford, of Erdenheim, is the president of the new organization.

Marietta, O.—The Crystal Dairy Products Company plant, built by the Crystal Ice Company on lower Third Street, is practically completed.

Oxnard, Calif.—Oxnard district is destined to become one of the largest dairy producing districts in the state, according to Max Heinzeman, Ventura county milk inspector. One advantage is its nearness to market, made possible by the completion of the Oxnard-Santa Monica stretch of highway, and the other is the farsightedness of the Ventura board of supervisors in passing the recent milk ordinance.

Boise City, Ida.—The Dairymen's Co-operative Creamery, Caldwell, celebrated its second anniversary on July 15 with a big celebration.

Roys Crossing, N. J.—Bellewood Dairy of Jersey City have just converted their three-tank continuous-flow pasteurizer into a four-tank positive system.

Blairstown, N. J.—Welch Dairy Co. of Long Valley
ordered glass-lined pasteurizing equipment for their
town plant.

Pellettown, N. J.—Sussex Milk and Cream Co. has
over the operation of the local creamery from Borden's.
continuous-flow two tank holders have been converted
three-tank positive system.

San Francisco, Calif.—Announcement was recently
by the Anglo London Paris Company of the purchase
Golden State Milk Products Co. of the entire capital
of the National Dairy Co. of this city.

Jefferson, Wis.—Jefferson's annual dairy day celeb
held at the fair grounds recently and which was sponsor
the Jefferson Citizens' Association, was attended by se
thousand Jefferson County people. The weather was
for holding a celebration of this kind.

Tarpon Springs, Fla.—D. Baillie is building a m
Jersey dairy plant here.

Marysville, O.—Fay Smith has just put in a two-to
frigerating plant in his dairy plant.

Columbia, Mo.—The Central Dairy, it is reported,
erect a two-story, 54 x 130 foot, dairy plant, to be constr
of brick, tile and terra cotta.

Chicago, Ill.—The Sellar Bros. Dairy Co. has increase
capital stock from $100,000 to $175,000 and 750 shar
non par value. The company also changed its name t
Mid City Dairy Co. The correspondent is Rieger & Ri
11 S. La Salle St.

Sun Prairie, Wis.—The construction work on the
shipping plant here which is being erected by the
Prairie Produce Co. is under way. The building will
floor space 60x80 feet. It will have a capacity of han
30,000 to 40,000 pounds of milk daily.

Fort Wayne, Ind.—Articles of incorporation have
filed by the Pleasant Hill Dairy Company, with A. C.
berich, county recorder. Buying and selling milk and
manufacture of dairy products will be the chief busines
the company. The incorporators are Carl Nieter, Ed
F. Clemmer and Ralph J. Urbine.

Henderson, Ky.—The purpose of the dairy camp
which is now being conducted in Henderson County, is t
duce those engaged in the dairy business to improve t
herds by procuring pure-bred stock and to induce other
go into the dairy business. Night meetings will be hel
Spottsville, Hebbardsville, Robards and Henderson.

Williamson, W. Va.—An extensive expansion prog
is in progress at the Dairy Products Company, which
cost $4,000 or more when the work has been complete
R. Leroy, owner, says.

Hereford, Tex.—C. C. Lisenbe, who recently moved
from St. Francis, has shipped a car load of good dairy
and expects to let the dairy business play a large part in
diversified farming program.

Chisholm, Minn.—A meeting will be held soon at w
the officers and members of the Chisholm Co-operative
Milk Association will discuss the kind of refrigeration p
wanted in their plant. This, it is estimated, will cost in
neighborhood of $3,600. Contracts for a pasteurization p
to cost approximately $4,000 were awarded.

Decatur, Tex.—Frank Kelley, farmer dairyman at P
dise, Wise County, won the prize of $25 offered by the D
tur Chamber of Commerce to the highest average butte
producing herd for the year in the Wise County Cow Tes
Association.

Port Allegheny, Pa.—Abbots Alderney Dairies, Inc.,
cording to its secretary, F. A. Paulson, 31st and Ches
Streets, Philadelphia, is the owner of the dairy buil

Stout Mfg. Co., 610 Sycamore St. Milwaukee, Wis which is being erected here at a cost of $30,000. It will be a one-story brick building.

Chicago, Ill.—H. Hahn, 9 S. Clinton, St., the architect of the new $200,000 two-story reinforced concrete building which will be erected on the northwest corner of 21st and Dearborn Streets, is taking bids on general and separate contracts. Murphy-Ward Dairy Co. is the owner of the new building.

El Monte, Calif.—Numbered among El Monte's million dollar industries is the Valley Dairy, Inc., 509 East Main Street, which gives employment to seventy-seven men and women and has an annual payroll of $150,000. Its present annual gross business is $1,000,000.

Ridgeland, S. C.—Efforts will soon be launched to bring a large number of dairy cattle to counties in lower South Carolina within the next year and efforts are now being made by farm agents in the lower section of the state to educate the farmers in the value of the cow and dairy products.

Marianna, Fla.—All dairies selling milk in the city of Marianna must submit to regular inspection by state health officers and when necessary to comply with such requirements as the rulings of the state board of health require.

Whittier, Calif.—The Whittier Sanitary Dairy is putting into commission this week a new two-ton Graham Bros. truck recently purchased, with which the dairy will haul its own milk to the plant from local shippers.

Cincinnati, O.—When W. G. Funke, of the Hyde Park Dairy Co., 3755 Edwards Road, entered the dairy business in 1899, he had eleven milk cows on a small farm near what is now Oakley. Today he is operating one of the finest dairy plants in this section of the state, using milk from approximately six hundred cows on seventy-five selected dairy farms in the vicinity of Cincinnati.

Taylor, Tex.—Throughout Williamson County, interest is growing in the proposed milk plant to be established here.

Jennings, La.—The appointment of a committee to investigate the proposition of a dairy industry for Jennings was announced recently by Louis Krielow, president of the Chamber of Commerce.

Yellow Springs, O.—At a conference of state and county health authorities and milk producers held in Dayton recently, plans were adopted for closer co-operation between health commissioners and milk dealers and the establishment of the best regulations possible.

Chicago, Ill.—The Wieland Dairy Co. has increased its capital stock from $2,500,000 to $3,000,000. The correspondent is Taylor, Miller, Dusch & Boyden, 231 S. La Salle Street.

Muskegon, Mich.—Construction of a new building for the Highland Park Dairy Company is well under way at Laketon Avenue and Division Street.

Orwell, O.—The milk receiving and cooling plant built here last fall by Cleveland dealers is in full operation.

Chisholm, Minn.—At a special meeting of the board of directors recently held, the lease was signed for the proposed creamery building of the newly incorporated Chisholm Co-operative Pure Milk Association.

Welch, W. Va.—The Welch Milk Company has enlarged its plant on McDowall Street. The plant is under the management of C. W. Bennett. It is planned to erect a new building within the next year for their plant.

Maysville, Ky.—Walter Page, general manager of the Carnation Milk Company, Oconomowoc, Wis., recently made a trip to Bracken and Robertson Counties. Mr. Page said that his company was much impressed with the showing made by the counties represented in the district proposed by the company for a survey for a condensery. He said he believes that if the company intends enlarging its plant with another division, Maysville will be considered.

Menominee, Mich.—Gilbert Berkey and Harry LaFleur sold their interests in the Pine Hill Dairy to Joseph Sterett & Son.

Chicago, Ill.—The Fox River Valley Dairy Co. has increased its stock from $70,000 to $100,000 and 1,500 shares of non par value stock and has decreased the number of directors from four to three. The correspondent is W. A. Leopold, 160 N. La Salle St.

Pittsburgh, Pa.—E. R. Quackenbush, manager of the Shadyside Milk Company, 126 Denniston Ave., reviewed the milk situation at an interesting talk before members of the East Liberty Trade Association.

Denton, Tex.—Improvement of the plant at a cost of more than $6,000 already is under way, according to announcements made by Mrs. Stout, manager of the Inglefield Dairy.

St. Johns, Mich.—J. G. Matthews, proprietor of the Matthews Dairy on Clinton Ave., has started excavation for his new dairy building on West Walker St. The building is to be a one-story structure, 28 by 66 feet, of tile construction with a brick front. It will probably be ready for occupancy about October 1.

Madisonville, Ky.—The U. C. Milk Company has awa contracts for the construction of a modern pasteurizing here. The building will be 35 by 70 feet of fireproof struction, concrete and hollow tile.

West Frankfort, Ill.—The West Frankfort Pure Milk has been placed on the accredited list of milk plants in nois and they have received their certificate of approval the state department of public health, which shows they have conformed with all the state requirements. T are only 135 accredited milk plants in Illinois.

Washington, D. C.—Four billion pounds increase in production was the record of 1926 as just compiled by department of agriculture.

Boston, Mass.—The A. & O. W. Mead Company has incorporated with a capital of $60,000 to deal in dairy food products. The incorporators are George V. Mead Francis V. Mead of Somerville, and A. M. Stoddard of Bos

Berlin, Germany, Europe—The consumption of mil the restaurant of the German Reichstag has increased 6 70 per cent, according to Wilhelm Sollmann, socialist de and former minister of the interior.

Leffel CREAMERY BOILERS

This cross section view clearly shows why Leffel Creamery Boilers are easy steamers, why they retain heat for a long time with one firing, and why they make possible fuel savings of from 20 to 40 per cent wherever they are used.

Every heat unit is utilized as the hot gases of combustion pass twice the entire length of the boiler through properly proportioned water-surrounded passageways. There is even water below the ash pit, to take advantage of the heat from any coals which may fall through the grates. Write for prices and descriptions.

Leffel Creamery Boilers are made in 14 sizes, from 6 to 150 H. P. They conform to all State Boiler Laws.

Every Plant Can Afford a Chicago Filter

Its simplicity makes it inexpensive. This same feature of simplicity makes it suitable for the smallest Dairy. The large volume of milk it will filter qualifies it for installation in the largest plants.

The thoroughness with which it does its work brings the commendation of health authorities. And the fact that it requires no extra floor space adds a final reason for your selecting the Chicago Filter for your plant.

Send for Circular and Prices.

30 W. AUSTIN AVENUE
CHICAGO, ILL.

DO YOU REALIZE THE VALUE *of Using the* NAFIS AUTOMATIC ACIDITY TEST?

Automatic burette reads direct in percentage acidity.

Concentrated Neutralizer is accurate and economical.

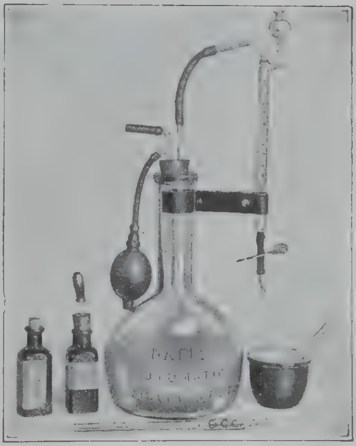
Nafis Stirring Rod contains correct color for sample in completed test.

It soon pays for itself because of the accuracy of the tests and saving of time.

Specify NAFIS GLASSWARE to your Jobbers.

Do not accept substitutes.

Write for our catalog, containing directions for many tests.



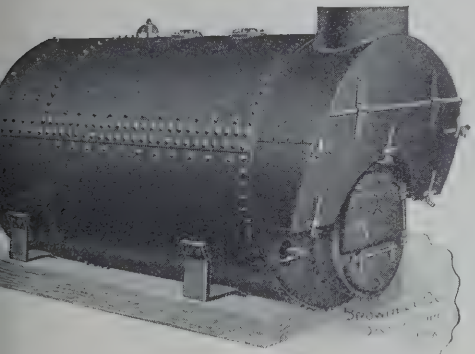
LOUIS F. NAFIS, INC.

Manufacturers of Scientific Glass Apparatus for Testing Milk and Its Products

17-23 N. Desplaines St. CHICAGO

Ask the Men Who Use It.

Dairy and Ice Cream Machinery and Supplies Association Inc.



Brownells comply with latest ASME and state codes.

Boilers for the Creamery Trade

Brownell started building steel boilers long before the Civil War and the craftsmanship born of long experience dominates the product.

In the *Creamery Field* the Brownell Boiler is well known—recognized as a product of distinction—correct in design, of accurately known strength, proven dependability.

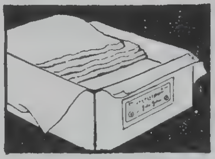
BROWNELL BOILERS

A SURE WAY *to higher milk profits!*



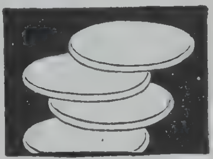
FILTER CLOTH

Sell these two filtering aids to farmers and dairymen. Then watch your milk improve. Coupon brings free samples.

A J. & J. Filter Cloth stretched over the pail at milking time is a *proved* method of reducing bacteria count. It catches the bacteria-laden dirt particles before the bacteria have a chance to multiply! When *your* supply men use this precaution your milk is bound to be better. But we don't ask you to take our word for it. Mail the coupon—get the free samples and try them out — *then watch the grading of your milk!*

Our advertising is teaching farmers and dairymen everywhere to use this Filter Cloth. Teaching them to use J. & J. Cotton Discs in their strainers, too. You will find it easy to sell them these two filtering aids.

Cut out the coupon now. We shall send price list and free samples by return mail.



COTTON DISCS

DIFCO

Bacto Galactose Whey Agar Dehydrated

A special medium for the cultivation and propagation of the Lactobacilli. Readily prepared and instantly available for use, yielding a uniform medium upon which comparable results may be secured over long periods of time.

Cultures of Lactobacillus acidophilus form colonies of the filamentous type and grow luxuriantly. The medium is most desirable in checking the viability of cultures of acidophilus, and in determining the degree of implantation in the intestine.

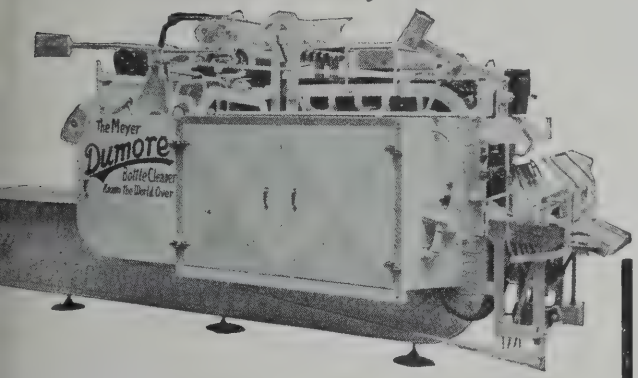
There's a Dumore to Fit Every Bottler's Purse



Get Complete Bottle-Cleaning Service—In ANY Capacity!

The Meyer Dumore system scrubs bottles clean—and when we say *clean* we mean CLEAN! Every particle of dirt or bacteria-breeding residue in the bottle is brushed out and flushed away—*no matter how hard-baked it is or how long it has been in the bottle!*

This is a thorough system. Submerged soaking in hot caustic solution, outside brushing, inside brushing, rinsing, inside rebrushing and complete rerinsing—that's the operation every bottle must go through. Quantity capacity never lowers the efficiency of the dependable Meyer method. A case a minute or a carload an hour can be delivered with unfailing regularity, day after day, at extremely low operating cost.

We are equipped for the construction of scientific sterilizing equipment—our plant is the largest in the world! Write for bulletins and ask for our free engineering service.

BORDEN MILK CO. TO GET SURPLUS MILK FROM DAIRYMEN'S LEAGUE.

An arrangement has just been made between the Dairymen's League and the Borden Milk Company, whereby surplus milk received at the Conewango, Wis., plant of the league will be received at the Randolph plant of Borden's. The league is more interested in the fluid milk supply of the city than in the manufacture of milk products, and the Conewango plant has been used largely as a shipping station.

This is a very practical way for the league to dispose of its surplus milk, and the Borden Company are glad to get the extra product. In the neighborhood of 16,000 pounds will be sent each day during the season of plenty.

Transportation is by means of trucks.

DAIRYMEN'S LEAGUE TO BUILD FIVE PLANTS I NEW YORK STATE.

Construction has commenced on the new milk plan at Crown Point, N. Y., being erected by the Dairymen' League. Two carloads of lumber are there and no delay is foreseen for the immediate construction of th factory.

Plans of the league include plants at Ticonderoga West Port, Beekmantown and Chazy. George H. West of Reber is president of the Roquet-Essex league; Chas Biglow heads the league at Crown Point; Harry Mc Dougal is president of the organization at Westport and the Ticonderoga league has for its president, Horace D. Smith.

Fred L. Porter of Crown Point has been awarded the contract to furnish the lumber for all the milk plants near here by the league.

A Bottle of Milk is A Bottle of Health

A Milk Slogan That has Gained the Attention of Millions of Consumers Through Advertising in National Magazines

IN THE June issue of The Milk Dealer we emphasized the need for a National Slogan which might be accepted as standard for milk advertising. A slogan that associates milk with good health meets the popular fancy and many such advertising phrases are employed by milk dealers the country over.

A slogan that has attracted unusual attention in a national way is the one used by the Thatcher Manufacturing Company, "A Bottle of Milk is a Bottle of Health." It was coined, we understand, by H. K. Dugdale, vice-president of The Green & Van Sant Company, who has handled all of Thatcher's advertising since 1923 when the present national campaign was inaugurated.

The nature of that advertising is familiar to readers of The Milk Dealer, and we believe they are interested in knowing the results accomplished. The Thatcher people realized that if they could help the milk dealer become a better merchandiser of his products they would profit indirectly.

How well they succeeded is told in an article in the Success Bulletin from which we quote as follows:

> "Magazine advertising was started in 1923. The objects of the campaign were twofold: To help dairymen in a constructive way by increasing the sale of their milk, and to educate consumers to buy only bottled milk, and to use more of it.
>
> "The active co-operation of the trade was necessary for the accomplishment of these ends. At first, this came slowly and no marked results were apparent. However, by 1925 approximately 3,000 dairymen were using large, colored posters on their wagons, trucks, etc., and in windows of stores where their milk was sold, advertising the Thatcher company's slogan, 'A Bottle of Milk is a Bottle of Health,' the slogan which had been nationally popularized through the magazine advertising. That year the company enjoyed the largest sales in its history.
>
> "The campaign, now in its fifth consecutive year, has accomplished exactly what it was planned to accomplish, namely: Increase the sale of bottled milk generally; increase especially the sales of bottled milk for customers of Thatcher Manufacturing Company, and increase the consumption of their milk bottles.
>
> "Persistent magazine advertising supplemented by trade paper and direct mail advertising, both to the dairy trade and to related influential groups, can be credited with the success of this campaign."

Last year a questionnaire was sent to all dairies that had made use of Thatcher posters and other supplemental tie-up material. Among the questions asked was what percentage of increase their sales had shown si starting to actively tie up with Thatcher's campai Nearly 600 respondent dairies reported substantial crease in their sales, and the average of the increas sales reported was considerably higher than the avera increase in milk sales for the country as a whole.

It is now planned that the leading manufacturers milk bottles, including Thatcher Manufacturing Co pany, will unite in conducting a co-operative campai of advertising to the consumer through the Glass Co tainer Association of America.

Mr. Dugdale, the originator of the slogan "A B tle of Milk is a Bottle of Health," has been a close st dent of merchandising conditions in the dairy busine for the past seven years, and was for several years pr fessor of advertising and marketing at the Universi of Maryland.

In "A Bottle of Milk is a Bottle of Health" he ma a real contribution to the dairy industry.

⁂

HIGH SCORING MILK DELIVERED TO LOS ANGELES COUNTY (CALIF.) PATRONS.

Los Angeles county, Calif., health department working with the dairymen in that county to help the produce high scoring milk. For members of the depar ment think that the most progressive and the healthie nations and communities are those which use larg amounts of dairy products.

If the milk available is not clean and of a good flavo its use will be limited, so every effort is being made this California county to produce a better grade milk. Evidently they are succeeding quite well, for a recent test milk from only five out of fifty-one di tributors scored less than 90.

DAIRYMEN'S LEAGUE PRESIDENT URGES LOGICAL PRICE FIXING.

In his talk to men of the New York milk shed, G. W. Slocum, president of the Dairymen's League Co-operative Association, Inc., urged them to take heed of the economic forces involved in price fixing and in other phases of the dairy industry.

He spoke of three definite ways of getting more money for the farmer: By more efficient production, by more efficient distribution, and by a higher price to the consumer. He said that while deciding on a higher price to the consumer, they must judge the other two factors to protect their market.

The New York milk shed includes 15,000,000 acres and supplies milk for 15,000,000 people, or 15 per cent of the population of the United States. Such a flow of milk requires 1,500,000 cows and an investment of $1,250,000,000 in farms, buildings, plants, stock and other equipment.

During the last year the Dairymen's League had a gross sales record of $73,716,900.

⚜

MAN'S NEED OF MILK IS NEVER OVER.

That man's need of milk is never over is shown by the report of the bureau of agricultural economics of the United States Department of Agriculture, which reports that the per capita consumption of milk in 1926 was 55.3 gallons agains 54.75 gallons in 1925, and 45 gallons in 1920.

The report shows the daily per capita consumption of milk and cream on farms was 1.47 pints last year, and in cities the consumption was .967 pints per capita. Daily per capita consumption of milk and cream in cities in 1925, was .951 pints.

RUBBERIZED FABRICS
266 So. Main Street AKRON, OHIO

A COMPLETE MILK SERVICE IS PRIME OBJ OF COMPANY.

The prime object of the Milk Service, Inc., 1823
Fourth Street, Dayton, O., is a complete milk ser
including both the preparation of milk for home
and the manufacture of all milk products.

Over 7,000 gallons of milk, from approximately
hundred specially inspected farms of the Miami Va
is being received at this plant daily and goes thr
the various channels of the organization, being prep
for bottle delivery to homes, industrial plants, an
tail groceries, manufactured into condensed milk,
cream products, butter, buttermilk, etc. The f
equipment obtainable for the handling of milk and
products is included in this large plant.

All milk coming into the plant is carefully teste
an expert chemist to determine the butterfat and
teria content. This chemist also makes tests of the
densed milk for commercial purposes and prepares
buttermilk cultures daily.

Sixty-five people, under the management of L.
Jackson, are required to handle the huge volume of
ness which is carried on daily, and sixteen motor tr
and twenty-one wagons are required to distribute
company's products.

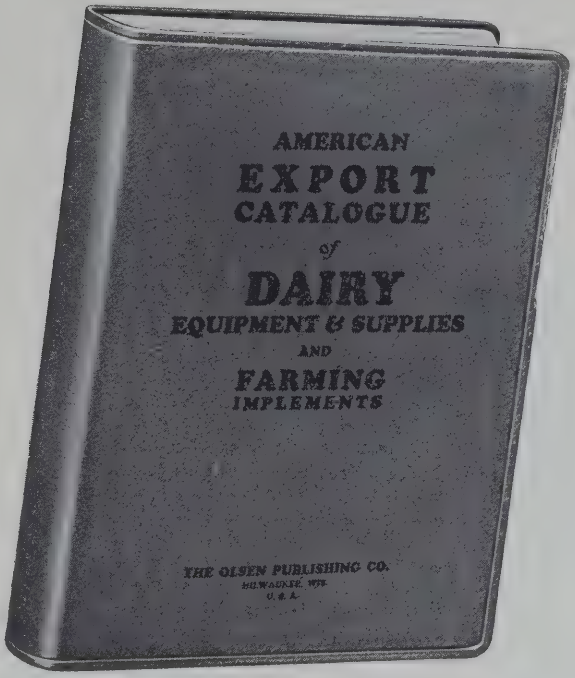
ATTENTION: Manufacturers and sellers of machinery, equipment, supplies, materials, etc.

The Span to Foreign Markets



THE time is "ripe" for American manufacturers of dairy machinery, equipment and supplies to sell to foreign dairy products manufacturers. The dairy industries are assuming the same prominence in foreign countries as they have already attained on the North American continent. Modern methods are being employed. Up-to-date equipment is being used.

American manufacturers have a wonderful opportunity to sell machinery, equipment and supplies to these new and vast markets. Foreign dairy products manufacturers are looking to this country for them. American manufacturers can hold these valuable markets by establishing and maintaining constant contact with overseas buyers.

The AMERICAN EXPORT CATALOG

of Dairy Equipment and Supplies

will establish that contact for you. It will enable you to keep your buying information in the hands of every important foreign buyer of dairy machinery, equipment and supplies. It will make it possible for you to receive a volume of overseas business that will be both large and desirable.

NEW ZEALAND HAS CLOSED GOOD DAIRY YEAR.

The president of the Royal Agricultural Society of New Zealand states that from the point of view of production, the dairying season just completed (June 30) ranked comparatively high, in fact, this was New Zealand's peak year up to the present, states a report by Consul General W. L. Lowrie, made public by the department of commerce. Prices for both butter and cheese had been on substantially low levels, and despite the increase in output, the value of the exports in dairy products showed a decline of nearly $2,000,000. The prices for this season's butter had undoubtedly been prejudicially affected by the huge carry-over of New Zealand, Australian and Argentine butters from last season. This carry-over had to go into consumption during a period when, under usual conditions, this season's butter would have been required.

Fairly substantial quantities of butter had been shipped during the season to Canada, United States, Australia, and the East, while quite a lot of New Zealand butter had found its way into North America from England. The increase in production of dairy produce was to a fairly large extent neutralized by the retention of "robber" cows. Herd testing was not being carried out on systematic, business-like lines throughout the Dominion. The lowest production recorded last year by a herd testing association was a yield of 11.13 pounds of butterfat in 120 days.

⚜

EASTERN DAIRYMEN PLAN TO SUPPLY DEMAND AS WISCONSIN SEEKS EASTERN OUTLET.

While middlewestern organizations are making plans to invade the eastern market with quality milk products, factions in the east are meeting to devise methods to take care of the milk supply themselves and keep out their competitors.

One of the midwestern organizations is the Wisconsin state department of markets, which expects soon to start on a milk grading venture. Should that venture prove successful, a market for millions of dollars worth of milk will be open to farmers, says Edward Nordman, commissioner of markets. Because southeastern and eastern cities are having a hard time to get milk that is suitable for their needs, it is planned to ship to them a high grade milk that will arrive in excellent condition, and receive in return a fair market price.

The main difficulty that stands in the way, now that transportation has been perfected, is the expense and inconvenience of an adequate inspection system. But a plan was recently submitted to the officials of a large eastern city whereby proper inspection could be given and the milk reach that city at a nominal price. It seemed to meet with favor.

By this plan it is not anticipated that any big price will be paid to the farmer, but it will open up an almost unlimited market.

⚜

PROPERTY OWNERS' CONSENT NEEDED BEFORE DAIRIES CAN BE ERECTED.

Hereafter when new dairies are proposed in the territory included between San Fernando Valley Annex and Los Angeles, Calif., before they can be established there will have to be a general consent by property owners in a wide area, before a permit from the city council can be secured. This consent must be obtained by the circulation of a petition to residents or to those who own land near the contemplated site. This is in accordance with a new ruling.

CHAIRMAN OF THE LONDON ENTERTAINM
COMMITTEE.

London, Eng., July 21, 19

Editor The Milk Dealer:

I know a great number of your readers will be
ested in the enclosed photograph of John J. Ph
chairman of the program and entertainment comn
of the World's Dairy Congress, 1928.

JOHN P. PHILLIPS.

Many of your readers will remember meeting Mr. Phillips at the World's Dairy Congress in Syracuse, N. Y. He is a member of the board of United Dairies, Ltd., and a member of the executive committee.

"Genial John," as he is called by his intimate associates, is a tireless worker and clever diplomat. His pleasant smile and charming personality enable him to smooth out difficulties and get things done where other men have failed.

When he sets out to do anything one can
always rely on its being done well, and completed,
the fact of his taking over the chairmanship of the
tertainment and program committee for the Wor
Dairy Congress, will insure that it will be thoroug
carried out, and no one will have cause for compla

He is a man with a large, generous heart, alw
ready to give a helping hand to those in need, or to
young fellow trying to get on.

He has a wonderful companion and helper in M
Phillips, whose ready sympathy and charm have
deared her to the thousands of employees of the Uni
Dairies.

Mr. and Mrs. Phillips keep an open house for th
friends, and have arranged many delightful sports
social functions for the employees of the company.

Yours faithfully,

P. B. TUSTIN.

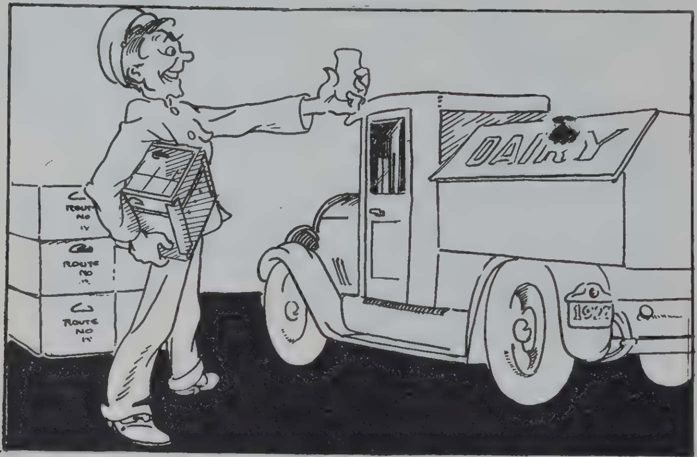
MIKE THE MILKMAN

GOOD EQUIPMENT

My firm is strictly up-to-date in bottle case and bottle crate; up to the minute, through and through, in every single bottle too! These things seem small, I know, to some, and many say, "How come?" but I contend and tell the boss good crates and bottles head off loss; I tell him they promote my sales by telling buyers pleasant tales! The cases that we have on deck are hard to mar and hard to wreck; they cost the boss a trifle more but pay their passage o'er and o'er! The bottles that we use, I'll say, are graceful as the Queen of May, of good design to please the eye, the kind that coax the folks to buy! They're tempered all their breadth and length until they have the proper strength! The glass is sparkling, bright, and clear without a bubble or a smear, while there's no doubt about their size—they're uniform as mother's pies; "ONE QUART" with them, that means "ONE QUART," it's not a guess, it's no report! The heads are made with proper dip so they're not liable to chip; the cap-seats grip the paper cap as tightly as a rabbit trap; I tell you these increase my pride, they put new vigor in my stride, they help me hold my chin on high, they put new sparkle in my eye! I place a bottle at the door with confidence of selling more! I know the contents are the best by every scientific test, but more than that—I also know the bottle has a special glow, it is a glass aristocrat, companion to the butterfat! Yes, bottles, cases, may all seem small and worthy of no thought at all, but as I've often, often said, they figure high in overhead, and what is more, it's doubly true that they tone the driver's point of view!—J. Edw. Tufft, Grand Forks, N. Dak.



⚜

GROWTH OF EMPIRE DAIRY IN 13 YEARS HAS BEEN RAPID.

In 1914 the Empire Dairy, Cedar Falls, Ia., had its inception in the basement of a building on Clay and Twelfth Sts., that city. At that time only one wagon was required to transport the milk and the products about the city. Today, in its new plant in Cedar Falls, nine men are required to dispose of the duties of the dairy, and three wagons and three trucks are needed to distribute the products of the dairy.

J. C. and E. F. Nasby, proprietors of the Empire Dairy, give the people of Cedar Falls a great deal of credit for their prosperous advancement.

"IN UNION THERE IS STRENGTH."

On January 1, 1927, the following dairies of Mt. A y, N. C., banded together, signed a contract between th selves and standardized their product, milk: Beech F ls Dairy, operated and owned by Ed. Davis; Maple Gro e, operated by Herbert D. Sykes; Meadow View, opera d by C. W. Taylor; Golden Guernsey, operated by G. D. Sikes and owned by Pete Beamer, and Jersey Dairy, y Will Beamer.

These dairies are still operating under the origi l contract, each dairy selling only grade "A" milk a d selling it at the same price. The dairies are all o erated under strictly sanitary conditions, and their mo o is "To Serve Well," which motto, according to th r patrons, is always carried out to the last detail.

⚜

HEALTH — A COMMUNITY ASSET.

The importance of health as an element of prima importance in a community's prosperity is emphasiz in a bulletin issued by the insurance department of t Chamber of Commerce of the United States.

An annual saving of at least $1,200,000,000, the d partment points out, has been effected by the reducti of the tuberculosis death rate since 1900.

General Gorgas's sanitary program, a part of the pr ject for the construction of the Panama Canal, saved t United States government, it is said, $80,000,000.

The advantage of proper sanitary conditions is of n less importance, from an economic viewpoint, to ever community.

'The ability of a man to work," the bulletin co tinues, "depends in large measure upon his healt Whatever reduces his earning capacity in any way r duces the assets of the community. And decrease i earning power is naturally reflected in reduced purchas ing power with the result that every case of illness o premature death involving a loss of wages has an effec upon the community. This may not be noticeable in in dividual cases, but the total sum is tremendous. Accord ing to an eminent statistician, the average workma loses seven days a year due to sickness, a loss of abou two per cent of his earning capacity. This amounts i the aggregate to at least $2,000,000,000 for the entir country. Premature death accounts for an even large loss, conservatively estimated by the same authority t be $6,000,000,000 annually."

⚜

DID YOU EVER STOP TO THINK

"That each additional industry in or near a city means an increase in population and wealth of a community?

"That the dairy industry should be encouraged?

"That this industry contributes much to the support and maintenance of our cities and country?

"That the dairy business is a great industry?

"That dairying is a cash business?

"That the dairyman knows every day what his product is selling for?

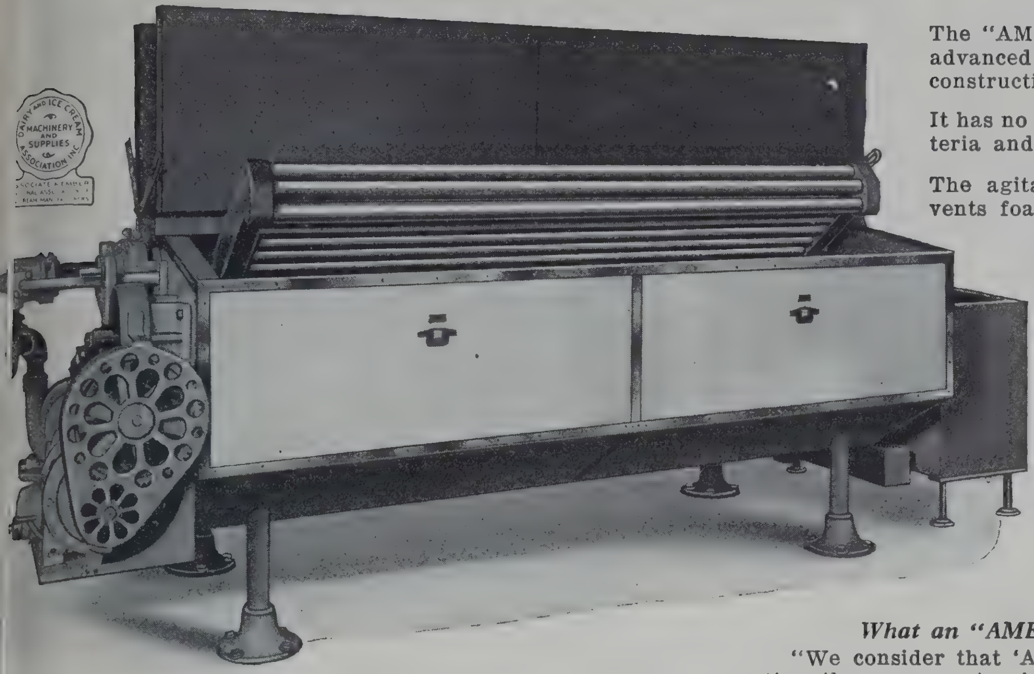
"That he receives his money for it regularly?

"That the dairy cow brings new wealth into a community every day?

"Milk not only nourishes our physical lives, but it nourishes our economic life as well."

The above are some expressions of E. R. Waite, manager of the chamber of commerce of Shawnee, Okla.

“AMERICO” THE PASTEURIZER WITH A PURPOSE



The new “AMERICO” with improved coil control

The “AMERICO” embodies the most advanced principles in design and construction.

It has no stuffing boxes to gather bacteria and contaminate the batch.

The agitation is gentle. This prevents foaming, churning and breaking of fat globules.

Heating is done with water below 160° F. There is no burning on the coils nor scorching of the product.

The flush type outlet valve is standard on all vats.

Thorough cleaning of all parts is accomplished with ease as the coils can be raised out of the vat.

What an “AMERICO” User Says:
“We consider that ‘AMERICO’ is nearer perfection than any pasteurizer we have ever used.”

"NATIONAL" A NEW HOSE CLAMP.

A new hose clamp embodying noteworthy improvements is now being introduced to the trade by the National Clamp Company, 16 East 41st St., New York.

The features which make the National clamp of especial interest are simplicity, the speed with which it may be applied or removed and the fact that one size will fit an extremely wide range of hose sizes. It consists of a band upon which is embossed a series of transverse ridges and depressions, forming in effect, a toothed rack. The screw engaging with this toothed band is mounted on a trunnion.

In applying the clamp, the band is slipped over any part of the hose and compressed by hand. Allowing the screw to swing into position, and taking a few turns with a screw driver tightens the band.

An interesting feature to dealers is the fact that they need carry only one, two or three sizes, depending upon the local demand. Having a perfect circular pull this clamp absolutely prevents leaks and being made of a high grade metal, thoroughly rustproofed, it adapts itself naturally to the dairy field.

NICKEL FACTS FOR THE DAIRYMAN.

"Nickel Facts for the Dairyman" is a 20 page booklet issued by The International Nickel Company, Inc., of 67 Wall St., New York. The subject matter is arranged in the form of questions and answers and makes interesting reading. A copy of the booklet will be sent by The International Nickel Co., Inc., on request. Below we give the first two questions in order that the reader may gain an idea of it:

"What Is Pure Solid Nickel?

"Pure solid nickel is a white malleable metal. It is a solid elemental metal, not an alloy or mixture of metals, and is produced in an exceptionally pure form. Pure solid nickel should not be confused with nickel plating, which is an electrically deposited nickel coating. Pure solid nickel has no coating to wear off—it is nickel through and through.

"Pure solid nickel should also not be confounded with nickel alloys on the market such as the nickel silvers
merly called German silver) and sometimes referred t
nickel, Waukesha nickel and other white nickel-bea
alloys.

"Where Does Nickel Come From—Is the Supply Limi

"The Sudbury district of Ontario, Canada, is the so
of over 80 per cent of the world's nickel supply. The m
and smelters of The International Nickel Company loc
there have an annual production capacity of over 25,000
of nickel. Conservative estimates derived from exten
diamond drilling of these nickel properties assure an a
supply of high grade ore for many score of years.

"From the smelters, matter is shipped to the compa
nickel refinery at Port Colborne, Ontario. Here the ni
matter is refined into pure nickel in raw form ready for
ther processing. From this plant, pure refined nicke
shipped to the rolling mills at Huntington, West Va., wh
the metal is rolled into all of the commercial forms as sh
on page 9 of this booklet. A modern foundry for the cas
of pure nickel is maintained at Bayonne, N. J.

"Nickel produced by The International Nickel Comp
is known as Inco nickel."

"LIQUID" BUYS LOEW MANUFACTURING COMPANY

On July 1 The Liquid Carbonic Corporation announ
the purchase of the Loew Manufacturing Company of Cle
land.

The Loew company is one of the oldest soaker manu
turers in the United States, having started in 1899, when
bottling industry was young. Their first machines w
of the pocket type, followed by soakers using the hyd
pressure principle. These machines proved so satisfact
that several thousand have been sold and are now in da
operation wherever dirty bottles are being cleaned. Wit
the last year they introduced the "Superkleen" soaker
marvel in bottle cleaning efficiency.

Realizing the possibilities of a soaking machine t
would be guaranteed to clean 100 per cent of the dirty b
tles returned to the bottling shop, the "Liquid" made ov
tures to the Loew company and a deal was consumma
whereby the latter will be operated as a division of
Liquid Carbonic Corporation.

The Cleveland factory will be operated as before a
will be in charge of John R. Gruetter, former chief engine
for Loew but more recently general manager of the Uni
Engineering Company.

The combined engineering forces of the "Liquid" a
Loew companies may be expected to develop even more e
cient bottle cleaning equipment.

ROOF INSULATION.

An interesting four-page circular on cork roof insulati
has just been published by L. Mundet & Son, Inc., of Hillsi
N. J. It includes specifications for cork on wood deck co
struction, over concrete construction, and over steel ro
decks. It states in full why cork insulation is better th
any other insulation for roofing. Keeps heat in. Keeps he
out. Eliminates ceiling sweat. Lasts indefinitely. Fits pe
fectly. Is immune to moisture, etc. A copy will be sent
request to any reader of this publication.

CANADIAN FIRM INSTALLS MEYER DUMORE MACHINES.

The J. J. Joubert Co. of Montreal, Quebec, has been ma
ing plans for the past six months to increase the efficien
and economy of its plant.

When considering bottle cleaning equipment they car
fully studied all types of machines and made their decisi
in favor of two Meyer Dumore Junior machines. The Ge
J. Meyer Manufacturing Co. of Milwaukee, builders of the

THE DAIRYMEN'S SLIDE RULE

PROBLEMS ON STANDARDIZATION OF CREAM

By B. I. MASUROVSKY, *Consulting Dairy Chemist and Technologist*, 216-218 Water Street, New York, N. Y.

Nearly every phase of dairy manufacture employing cream for making dairy products, whether it is butter, cream cheese, ice cream or even special kinds of modified creams, results in problems involving standardization of the raw material—cream.

Let us take, for example, the manufacture of butter. The cream before ripening is thinned down with a starter or otherwise from about 45% butterfat to the generally accepted richness of cream for churning purposes, namely, about 30% butterfat. The percentage of butterfat in the starter or skim milk used in standardization of cream is negligible and is considered as zero in practical work. This condition should be observed in all problems of standardization involving the use of skim milk. The next important condition is to test the cream for butterfat so that the exact percentage of butterfat in a given cream is known. This of course is determined by chemical analysis or butterfat test. With these conditions in mind we are ready to start standardizing cream not only for butter making, but for any other purpose.

PROBLEM I—Standardize a 40% cream for butter making by bringing it down to 30% and using skim milk for this purpose. How much skim milk is required for standardizing 100 lbs. of cream to test 30% B. F.?

SOLUTION

Step I—Employ the Dairymen's Slide Rule by finding 2.5 as the butterfat factor for 40% cream on the B. F. f. scale of Slide Rule and located opposite 40 found on the B. F. scale of the Dairymen's Slide Rule.

Step II—Follow the settings of scales A and B of the Dairymen's Slide Rule as given below:

A	Place 1	Under 30
B	Over 2.5	Find 75

In other words, it requires 75 lbs. of cream testing 40% B. F. to make 100 lbs. of cream testing 30% B. F.

Step III—Since the amount of 40% cream is known it remains to subtract it from 100 and the result will be the amount of skim milk necessary to complete the standardized 100 lbs. of 30% cream.

PROOF

100 — 75 = 25, or for every 75 lbs. of cream testing 40% B. F. there is need for 25 lbs. of skim milk to obtain 100 lbs. of cream testing 30% B. F. In other words, the ratio of 40% cream to skim milk is 75 : 25 or 3 : 1.

PROBLEM II—Prepare 425 lbs. of 28% cream by using 39% cream and sweet skim milk. How much skim milk and how much 39% cream will be required for this purpose?

SOLUTION

Step I—Figure out the amount of cream testing 39% necessary for every 100 lbs. of 28% cream. Employ the Dairymen's Slide Rule by finding 2.57 as the butterfat factor for 39% cream on the B. F. f. scale as located opposite 39 found on the B. F. scale of the Dairymen's Slide Rule.

Step II—Follow the settings of scales A and B of the Dairymen's Slide Rule as given below:

A	Place 1	Under 28
B	Over 2.57	Find 72

In other words, it requires 72 lbs. of cream testing 39% B. F. to make 100 lbs. of cream testing 28% B. F.

Step III—How much skim milk is required for every 100 lbs. of standardized 28% cream?
Since the amount of 39% cream is 72 lbs. for every 100 lbs. of 28% cream the remainder must be the amount of skim milk, namely, 100 — 72 = 28, or the proportion of cream to skim milk is as 72 : 28.

Step IV—What are the amounts of 39% cream and skim milk for the required 425 lbs. of standardized 28% cream?
Establish the derived proportion (See Step III) on the Dairymen's Slide Rule in the following way:

A	Place 72	Find 2.57
B	Over 28	Over 1

Or 2.57 plus 1 constitute 3.57 parts weighing 425 lbs., or each part being equal to 119, i. e., the amount of 39% cream is 2.57 times 119 or 306 lbs.
The last two calculations can be established on the Slide Rule as follows:

A	Place 425	Find 119
B	Over 3.57	Over 1

A	Place 1	Under 119
B	Over 2.57	Find 306

The amount of skim milk is 119 lbs. for the 425 lbs. of 28% cream and the amount of 39% cream is 306 lbs., as shown in these calculations.

PROOF

306 lbs. of 39% cream contain 119.34 lbs. of butterfat and 425 lbs. of 28% cream contain 119.00 lbs. of butterfat, thus checking up within 0.34 lbs. of butterfat on a 425 lb. standardization in a practical way.

PROBLEM III—Standardize 1000 lbs. of 40% cream to 22% using skim milk.

SOLUTION

Step I—Look up the butterfat factor (B. F. f.) of 40% cream on the Dairymen's Slide Rule. This is accomplished by finding 40 on the B. F. scale and straight above 40 notice 2.5 on the B. F. f. scale. Therefore, the butterfat factor of 40% cream is 2.5.

Step II—Find the amount of 40% cream necessary to standardize every 100 lbs. of 22% cream with skim milk. Place 1 of scale A over 2.5 on scale B. This is done in the following way: Draw the sliding part of the rule to the right until the extreme left number 1 of scale A coincides with 2.5 (2 and five main divisions) on scale B. Then bring the glass indicator (runner) to the left until its hairline cuts 22 (2 and two main divisions) on scale A and below find that the same hairline cuts 55 (5 and five main divisions) on scale B. This answer 55 is the number of pounds of 40% cream required for every 100 lbs. of standardized 22% cream.

Step III—What is the proportion of 40% cream to skim milk in the standardized 22% cream?
Since we found that it requires 55 lbs. of 40% cream to build up 100 lbs. of 22% cream it stands to reason that the amount of skim milk necessary is the difference, i. e., 100 — 55 = 45, or the proportion of 40% cream to skim milk in the standardized 22% cream is 55 : 45.

Step IV—How much skim milk is necessary to add to the 1000 lbs. of 40% cream in order to standardize it to 22% cream? Placing the proportion obtained above on the Dairymen's Slide Rule we find the following setting:

A	Place 55	Under 100
B	Over 45	Find 82

Which means that for every 100 lbs. of 40% cream it is necessary to add 82 lbs. of skim milk and for 1000 lbs. ten times as much or 820 lbs. (100 in the above setting is the extreme number 1 on the right end of the Dairymen's Slide Rule on scale A).

PROOF

1000 lbs. of 40% cream plus 820 lbs. of skim milk give rise to 1820 lbs. of 22% cream is the answer to Problem III. Let us check up. 1000 lbs. of 40% cream contain 400 lbs. of butterfat and, obviously, the 1820 lbs. of the standardized 22% cream will contain these 400 lbs. of butterfat. Dividing 400 by 1820 and multiplying the quotient by 100 will give us the percentage of butterfat in the 1820 lbs. of standardized cream. This can be accomplished on the Dairymen's Slide Rule as follows:

A	Place 400	Find 22
B	Over 1820	Over 1

Answer: 22% B. F.

THE DAIRYMEN'S SLIDE RULE IS DISTRIBUTED BY

THE OLSEN PUBLISHING CO.

501-515 CHERRY STREET
MILWAUKEE, WIS.

AND WILL BE SHIPPED ANYWHERE POSTPAID ON RECEIPT OF $5.50

ONCE A USER BECOMES FAMILIAR WITH MAKING THE CALCULATIONS BY THIS SLIDE RULE MUCH TIME IS SAVED AND THE HIGHEST DEGREE OF ACCURACY RESULTS.

Notice—In a subsequent article a description of the Dairymen's Slide Rule will be given so far as its development and uses are concerned.

machines, planned the arrangement of equipment and these machines were installed in the Joubert plant just recently.

A HANDY BOOK ON BALL BEARINGS.

With so much equipment running on ball bearings these days it is well to keep handy some information about different sizes, specifications for ball races and collars that might be needed some day in a hurry. Manufacturers of dairy products should find worth having catalog No. 8 published by The Gwilliam Company, 23 Flatbush Ave., Brooklyn, N. Y. It contains more than 50 pages of illustrations, specifications and a variety of other information about ball bearings.

⁂

BUTTERMILK—A MODERN DRINK OF BIBLICAL TIMES.

Buttermilk has been known as a health giving drink since Biblical days but it is only recently that it has been found that the addition of a fraction of a per cent of gelatine makes buttermilk a much smoother and creamier dring and keeps it from separating or "wheying off," according to such authorities as Professor T. G. Yaxis of the Massachusetts Agricultural College and Professor Wm. H. E. Reid of the University of Missouri.

This new combination is rapidly gaining popularity with the American public as it furnishes a cooling, refreshing and healthful drink. According to dietitians and health experts it has long been known that buttermilk is a real food as well as an appetizing drink, for it contains a very fine quality of protein, valuable mineral salts, sugar and a lactic ferment which gives it a sharp satisfying taste. Doctors recommend it because it stimulates digestion, acts as a tonic on the body and helps to correct constipation and other disorders of the digestive tracts.

An ideal sustaining lunch for the business man or housewife is, for example, a sandwich or salad and a glass of buttermilk to which a little gelatine has been added, or gelatinated buttermilk, as it is called.

⁂

BUREAU OF AGRICULTURAL ECONOMICS ANNOUNCES NEW TITLES.

The bureau of agricultural economics, United States Department of Agriculture, has announced that federal dairy products inspectors are now known as official graders and the government inspection certificates on dairy products are now known as official grading certificates. The ruling became effective on July 1. The change in designation has been made to clarify the work of the department with reference to its various activities relating to dairy and poultry products, and to conform to international terms, with respect to grading of these products for quality and condition.

STUDY OF MILK AND COFFEE HABITS OF PITT BURGH CHILDREN MADE.

John C. Fetterman, chairman of the milk service co mittee of the Pittsburgh District Dairy Council; M. I lian Conwell Shillinger, formerly director of the nut tion extension department of the Pittsburgh Distr Dairy Council, and R. Roy Irvin, industrial fellow, M lon Institute of Industrial Research, University of Pit burgh, have just completed an extensive survey of t milk and coffee drinking habits of 80,070 school childr in the Pittsburgh district.

Analysis of the returns showed that the average ci public school child drank 1.47 glasses of milk and cup of coffee; the average city parochial school chi .93 glass of milk and 1.52 cups of coffee; the avera county public school child 1.58 glasses of milk and . cup of coffee, and the average county parochial scho child .89 glass of milk and 1.37 cups of coffee. The figures apply only to the elementary grades, and do n include kindergarten and high school grades.

A comparison of the milk and coffee habits of chi dren living in some of the better sections of the cit with those of children living in the slums and indu trial sections was made and it was shown that the fir named group drank 2.13 glasses of milk and only .3 cup of coffee, while the second group consumed 1.1 glasses of milk and 1.10 cups of coffee. It was notice that the children in both groups consumed more mil for lunch than at breakfast or supper.

⁂

NEW FIRM TO PROMOTE MILK STERILIZATION PROCESS.

Killing bacteria in milk and cream by "crushing" them instead of by prolonged heat applications is th theory back of a process which will soon be offered t dairy plant owners. The Wisconsin Steril Milk Co. o Waukesha, Wis., with George Grindrod, formerly wit the Carnation Milk Co., as president, is promoting th process.

A new demonstration plant and laboratory has bee erected in the outskirts of Waukesha and the proces will be in operation by Sept. 1.

The claim is advanced that milk and cream can b made absolutely sterile by exposure to steam for one minute at a temperature of 230 degrees F., using only one or two minutes for advancing the temperature t that point. Of course, special equipment is necessary for the process.

Tests that have been made indicate that there is no cooked taste in the sterilized product and that it will keep sweet for many days under ordinary milk handling methods.

⁂

BUSINESS HAS GROWN RAPIDLY SINCE MERGER.

Since the merger of the Mandt Dairy Company and the East Side Capital Dairy Company, both of Madison, Wis., business has been growing rapidly, and more than 3,000 homes are being supplied with Mandt dairy products. Two trucks have been added to their force, one to take care of the general wholesale business and the other to handle their rapidly increasing butter business. A new series of cooling coils have been added that will easily handle 25,000 pounds of milk per day.

The company is located at 9 North Brearly Street, and the personnel of the company consists of a group of young men who aim to give the best possible service to Madison.

RODUCERS PREPARING TO COMPLY WITH NEW DAIRY RULES.

Madison (Wis.) producers of raw milk are now pre-ring to put their dairy farms in condition to meet the quirements for the production of what will be known "Madison Grade A raw milk," under the terms of e new ordinance which will go into effect in Madison, is., on November 1st. The new standard requires a cteria count not in excess of 50,000 per cubic centi-ter.

Following are the rules which the producers must rictly adhere to:

Herds will be tested for tuberculosis annually, and any actors will be disposed of according to existing regu-tions. Barns must have at least three square feet of ndow space per cow and 500 cubic feet of air space r stanchion.

Floors of dairy barns must be of concrete or other pervious material and walls and ceilings finished and pt whitewashed as hitherto required. In case of a cond story, the ceiling of the first floor must be sealed.

A separate milk house or room is required under the w regulations and explicit rules for its construction d maintenance are set forth including the elimination flies.

The water supply of the dairy, the brochure states, all be easily accessible, adequate and of a safe, sani-ry quality, and detailed instructions for the process milking and handling the product are included in the gulations.

Milkers and milk handlers must wear clean outer gar-ents, and milk must be removed from the barn prompt- and strained in the milk house.

The milk must be cooled within one hour after milk-g, to 55 degrees F., or less, and maintained at or be-w such temperature until delivered.

Every person, the regulations state, who is connected th a dairy and whose work brings him in contact in y way with the product must have within six months ssed a medical examination by a licensed physician. certificate of such examination must be filed with the ard of health.

Notice must be sent the Madison board of health im-ediately by any milk producer or distributor upon ose dairy farm any case of sickness, or any infection, ntagious or communicable disease occurs, the regula-ns conclude.

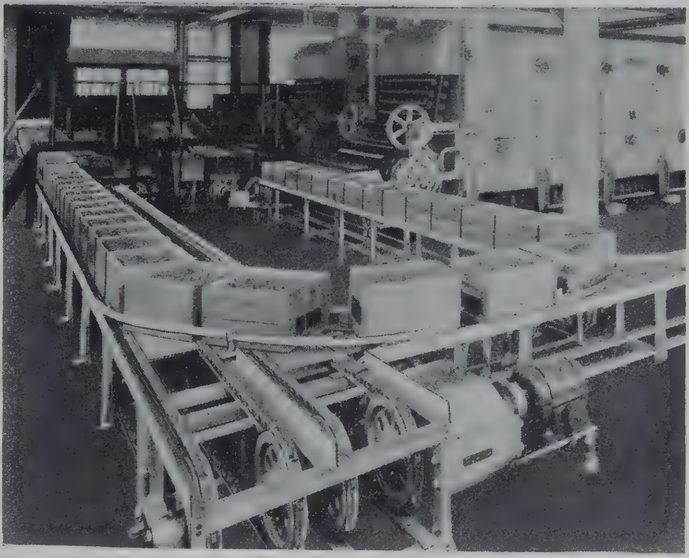
* * *

NEW JERSEY ADOPTS NEW REGULATIONS CONCERNING PASTEURIZATION.

The following additional regulations governing the steurization of milk and cream in the pasteurizing nts in New Jersey have been adopted by the Depart-nt of Health of the State of New Jersey:

All plants, where pasteurized milk or cream is bot-d, shall be provided with mechanical bottle fillers d cappers for use in filling and capping bottles of lk. Caps shall be obtained in sanitary tubes and kept erein until used.

Every pasteurizing plant operator shall, in addition the pasteurizing apparatus, provide an accurate in-ating thermometer for the purpose of checking the cording thermometer. The indicating and not the cording thermometer shall be used as an index of the nperature of the milk or cream by the plant operator.



Mojonnier

Bottle Case Conveyors

Speed Up Production and Reduce Handling Costs

THE Mojonnier Bottle Case Conveyors make the handling of bottle cases in the milk plant entirely automatic. The only hand handling necessary is putting the cases on the wagons or taking them off.

The conveyor on loading platform conveys cases of bottled milk to wagons, and empty cases from wagons to bottle washers. Double track system from wagon platform to bottle washers, and to storage.

Conveyors bring cases of empty bottles automatically to hand of each operator. Operator does not have to touch cases. Double track conveyor takes cases through enclosed 15 foot case washer, and then to filled bottle accumulating table.

Cleaned cases are conveyed automatically, after being filled, to cold storage room, passing through self-closing door.

We will be glad to work with you on a conveyor system suitable for your particular plant. Write for further information.

WANT DEPARTMENT

HELP WANTED
(Rate: 2c per word)

WANTED—Salesman to handle a side line article of merit now on the market and selling to the dairies. A good repeater; will help to increase milk sales. Address: D-323, The Milk Dealer. 8-27tf

WANTED—Salesmen calling on dairies to sell our bottle crate on commission. Liberal proposition. American Box and Crate Co., Louisville, Ky. 8-27tf

If you want a Manager, Superintendent, Expert Chemist, Bacteriologist, Buttermaker, Pasteurizer Man or Ice Cream Maker—or help of any kind—"The Milk Dealer" can help you find the best available man.

MISCELLANEOUS.

NOTICE—Clients who have an expansion program, surplus problem, better machinery arrangement, man hour study of operations, design suitable dairy or creamery buildings, machinery required and lay-outs, installations and made to operate. Write us for our proposition. Address: D-407, The Milk Dealer. 9-27

POSITION WANTED
(Rate: 2c per word)

POSITION WANTED—As plant superintendent or foreman by a young married man, college trained, with nine years practical experience along all lines of the dairy industry, including plant foremanship. References. Address: D-437, The Milk Dealer. 8-27

POSITION WANTED—By young married man 30 years old as sales manager or route supervisor. Has had ten years milk and ice cream sales experience. Address: D-436, The Milk Dealer. 8-27

POSITION WANTED — By ambitious young man with four years experience in doiry work including short course at Penn State, as helper or foreman in small modern milk plant. Can give references. Address: D-432, The Milk Dealer. 8-27

POSITION WANTED — By experienced production manager and ice cream maker. Can give best references. Address: D-419, The Milk Dealer. 8-27

POSITION WANTED — Dairy chemist and specialist, 38, married, American, with 14 years experience in food and dairy products, plant and laboratory management, production of casein, milk sugar, albumen, etc., desires scientific position of responsibility. References, publications and photo supplied. C. L. Beals, 7 Buena Vista Ave., Providence, R. I. 8-27

POSITION WANTED—Man with training and experience in production and distribution of certified and market milk. Prefer connection with opportunity to build sales. Address: D-444, The Milk Dealer. 8-27

POSITION WANTED—By an experienced dairy and creamery man, as plant foreman; have 18 years of experience, last 8 years as plant foreman; have experience in all branches of the dairy business, also economy, sanitation and handling of men. Can furnish the best of references. Can come to work on short notice. Address: D-448, The Milk Dealer. 8-27

POSITION WANTED—By dairyman as all around man with 8 years experience in pasteurizing and buttermaking, the growing of cultures, commercial buttermilk and sour cream. Well acquainted with the different ways of chemical tests. At present foreman of a dairy handling about 20,000 quarts daily. Address: D-453, The Milk Dealer. 8-27

Looking for a better position? Why not try a Milk Dealer Want Ad?

RATES

2c per word for ads placed under headings "Help Wanted" or "Position Wanted."

5c per word for ads placed under all other headings — "Wanted to Buy," "For Sale or Exchange," etc.

In computing amount of remittance, add six (6) extra words if wanted published under Blind Address.

Bold Type—Double regular rates.
Minimum Charge—50c.
Blind Address — EXTRA — 25c in U. S. only; 65c Foreign — To cover postage in sending out replies from this office.
REMITTANCE MUST ACCOMPANY ORDER.

IT PAYS TO ADVERTISE

NOTE: Names and addresses of advertisers using blind addresses cannot be furnished direct from this office. The advertiser can be reached only by using the key number and addressing your reply care of this paper.

NOTICE

The publisher disclaims any responsibility for the reliability of parties advertising in the Want Department, nor for the truthfulness of statements made in such advertisements. In answering such ads, ask for references if parties are unknown personally, before sending money. Our subscribers are requested to assist us in keeping unreliable parties from advertising by reporting suspicious dealings.

We reserve the right to refuse to accept advertisements which we believe are detrimental to the dairy industries.

Want Ads are accepted up to 7th of month preceding date of issue. Forms close on that date.

FOR SALE or EXCHANGE
(Rate: 5c per word)

BUSINESSES

FOR SALE—A completely equipped milk plant bottling 350 gallons of milk in town of 6,000 in middle states. Only plant in town with pasteurized milk ordinance This plant is clearing $600-$700 per month. Good reason for selling. $10,500, with terms to right party. Address: D-402, The Milk Dealer. 9-27

MACHINERY AND SUPPLIES

FOR SALE—One new $640 Cresco 200-gal. pasteurizer with motor direct connected. Sacrifice price, $490.

One new $75 Milwaukee bottle drainer. Sacrifice price, $55.

One new $325 Alvey bottle case elevator. Sacrifice price, $275.

One rebuilt C-P 150-gal. coil pasteurizer. Sacrifice price, $225.

One No. 12 $110 De Laval separator; universal drive, used only about 6 months. Sacrifice price, $67.50. Address: D-270, The Milk Dealer. 8-27tf

You cannot afford to miss a single copy of The Milk Dealer. Have you sent in your renewal?

FOR SALE — Refrigeration Machines - Used—We have several used and new m chines of nationally known make, whi we can sell at a big saving to you. W erect and guarantee the plants fully. A dress: Erecting Engineers Company, 47 West Lake St., Chicago, Ill. 8-2

If that business of yours does not s you, somebody else will be glad to get Let them know about it through a "Mi Dealer" Want Ad.

FOR SALE—Here is an opportuni New Davis rotary filler, Junior size, Mo 640, motor driven, cost $700. A reasona offer takes it. Also nearly new De Lav separator, capacity 2,500 lbs. per ho direct motor drive, for $125. Cost $1 We also have several tubular milk coo ers, large and small sizes. Address Merk Dairy Company, 2727 N. Halsted St., Ch cago, Ill. 8-27

FOR SALE—One Yundt air brush bott washer, capacity 120 bottles per minu complete with motor driven air compre sor, 3 phase, 60 cycle, 220 volt motors a conveyors. Used about 2 years. In go mechanical condition. Original cost i stalled $15,000. Will sell for $7,000, f. b. St. Louis. Write to the Meyer-Blan Company, St. Louis, Mo. 9-

FOR SALE—Cherry Junior pasteurize Five horse power boiler, brine pum equipment nearly new. Address: Occ pant, 2219 McKinley Ave., Keokuk, Ia. 8-

FOR SALE—Several single horse mil wagons. Bowman Dairy Company, 18 Berteau Ave., Chicago, Ill. 8-2

FOR SALE—Twelve one-horse straig sill milk wagons, equipped with tail gate Priced $25.00 to $50,00, f. o. b. Chicag Address: D-425, The Milk Dealer. 8-2

FOR SALE—Kunsman Milk Advertisin Talks, Series No. 2. A year's campaign— 57 ready written ads—only $5.00. Mone back if not satisfied. Kunsman Ad. Ser vice, 29 Reed St., Reading, Pa. 10-2

A small cash investment and the serv ices of a live young man in the milk busi ness are what many proprietors are i need of. You can locate good opportuni ties through a Milk Dealer Want Ad.

FOR SALE—To the Milk Dealers—W have 15 milk wagons and 10 sleighs. The are 8 months old and in best of condition Address: Grand Rapids Creamery Co., 30 Scribner Ave. N. W., Grand Rapids, Mich 8-2

FOR SALE—Rebuilt and guarantee dairy equipment at worth while savings Write for price list. Lincoln Equipmen Company, 2611 Stevens Ave., Minneapolis Minn. 8-27t

A motor truck, milk wagon—in fact, anything of interest to milk dealers, can be disposed of through "The Milk Dealer" Want Department.

FOR SALE—York 5-ton refrigerating plant, twin cylinders. York twin cylinder 5-ton refrigerating plant, complete. Brunswick single cylinder four-ton, complete, $275. Brunswick twin cylinder. chain drive, eight tons refrigeration, compressor only, $190. Berryman Bros., 305 Drexel Building, Philadelphia, Pa. 8-27

WANTED TO BUY
(Rate: 5c per word)

WANTED—Used pasteurizing vats, coolers, ice breakers, ice cream cans and tubs, churns, etc. Send us list of what you have for sale. B. Riley Hauk & Son Company, 201 S. First St., St. Louis, Mo. 8-27tf

WANTED—To buy or lease with option of buying a good paying retail milk plant. Must be in a good business town. Address: D-439, The Milk Dealer. 9-27

WANTED—Milk route or small dairy. Northern Ohio preferred. Address: D-445, The Milk Dealer. 8-27

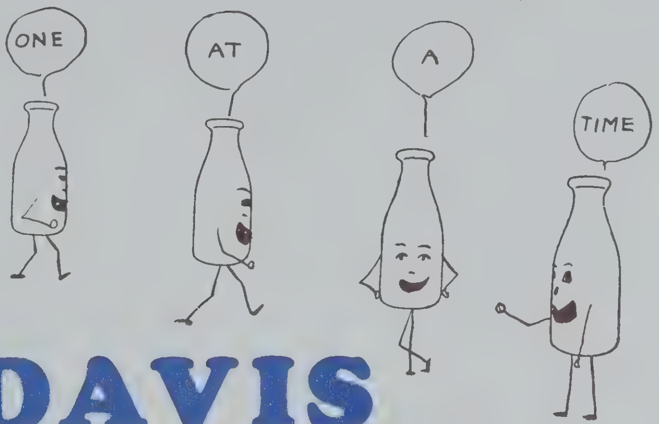
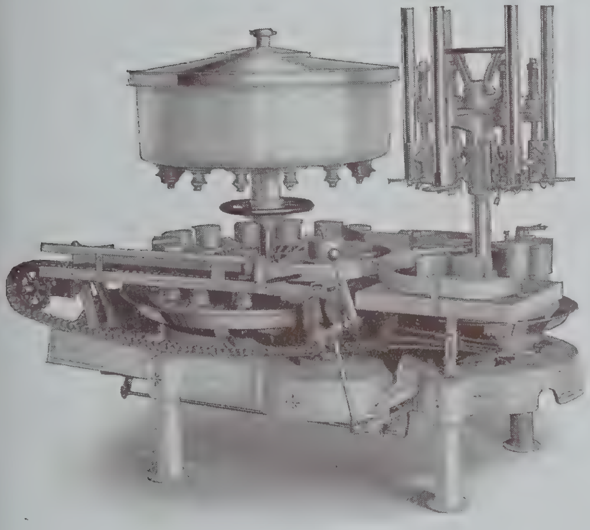
All Rotary Principle *eliminates crowding*



DAVIS

Rotary Milk Bottle Filler and Capper



This is the No. 5 Model—the fastest filler and capper made today. 66+ pints or 53+ quarts is the rated capacity. Two smaller sizes, Nos. 6 and 7, have capacities of 24 and 38 quarts per minute, respectively.

One—at—a—time—there's the reason why the Davis is the fastest, smoothest and most satisfactory of all bottle fillers and cappers.

Because the bottles are filled and capped individually, they are never bunched, crowded nor broken. Consequently, neither fillers nor cappers are overworked, milk is not spilled and the entire machine operates with such smoothness and rapidity that the inexperienced onlooker is amazed at the sight.

The all rotary principle as embodied in the Davis is the result of many years study in bottle filling and capping methods. Through constant effort, *CP* Engineers have improved and elaborated upon the original machine so that today finds the Improved Davis without a peer in its particular field.

Bulletin 1167, just issued, gives complete details. Write for a copy.

Sterile Bottles

MAY *now* be secured at a very low cost, *but* you must use efficient and dependable washing methods. The YORK Four Bottle Washer and Sterilizer is the best machine to produce these results.

The YORK Four Bottle Washer and Sterilizer will handle 3 crates per minute, which is equivalent to 2160 quart bottles or 3600 half pint or quarter pint bottles per hour.

It is the machine best adapted to the needs of the medium sized dairy or milk plant and can be furnished for belt or motor drive, with or without power feed.

Crates—Milk Bottle Washers and Sterilizers—Crate Transfer Trucks—Milk Pumps—Ice Cream Can Trucks.

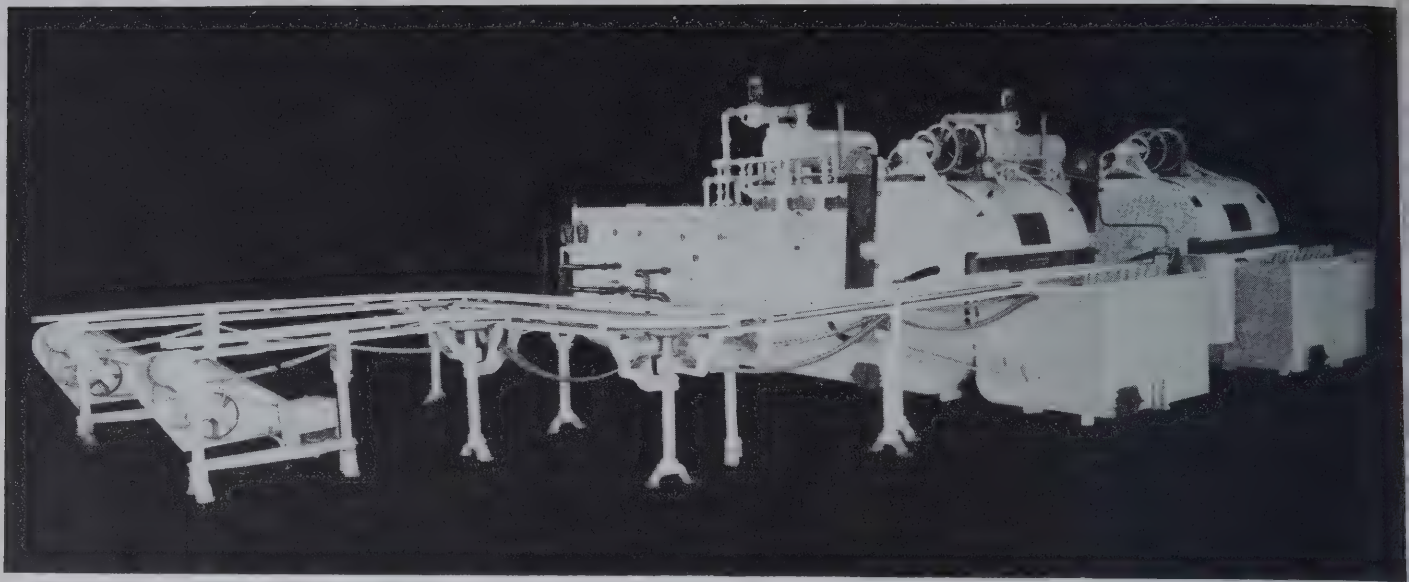
BAUER CO.

olume 16 September, 1927 Number 12



1 **Simplicity**
Fewer parts: practically no mechanical attention.

2 **Compactness**
One-third less floor space than other machines of equal capacity.

3 **Hydraulic**
Washing, pre-rinsing, soaking, pressure washing.

4 **One-Man**
Machine; clean bottles come out at feed in end.

5 **Capacity**
20 to 60 bottles per minute; easily regulated to filler and capper.

6 **Accessibility**
No working parts inside of machine.

7 **No Adjustments**
for various sizes of bottles.

8 **No Breakage**
Perfect temperature control eliminates breakage.

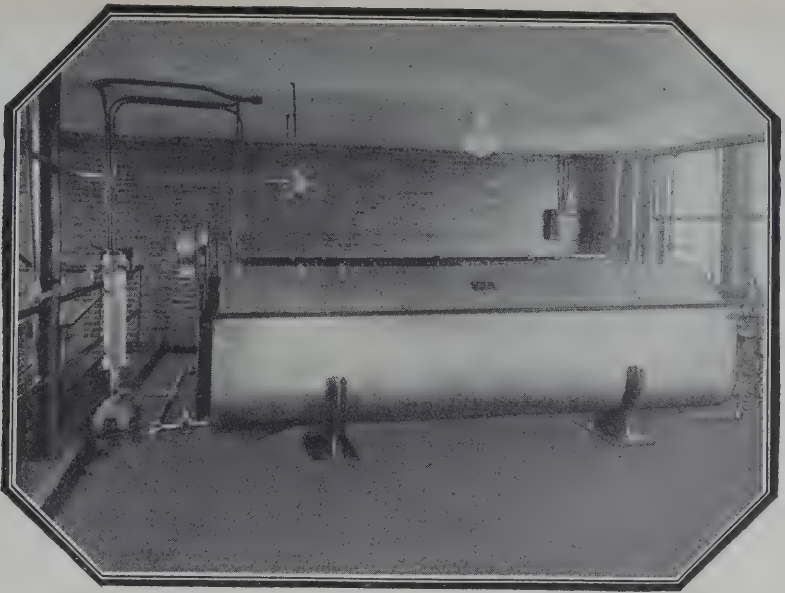
8 Reasons Why the *Ladewig-Soelch* SUPER 8 EIGHT

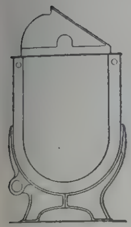
Ranks first among all Bottle Washers

SIMPLICITY, Compactness, Hydraulic Principle, One-Man Operation, Capacity, Accessibility, No Adjustments, No Bottle Breakage—these things mean *low washing costs.* Each one of them is the cumulative result of twenty-two years of building successful washers. And today in this latest Ladewig-Soelch, you have a *super* washer embodying the soundest engineering principles, yet far advanced in design and construction, and bottle washing efficiency. Let us send you complete information about this remarkable machine.

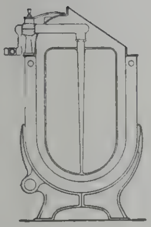
A. H. ARNOLD & COMPANY
718 W. RANDOLPH ST., CHICAGO, ILL.

Manufactured by Ladewig-Soelch Co., 38th & Lapham Streets, Milwaukee, Wis.

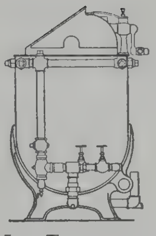




Simple, Sanitary Construction



Gentle Agitation



Low Temperature Heating Water

These 3 Features Have Made the BURRELL Outstanding

SIMPLE, sanitary construction, gentle agitation and low temperature heating water have made the Burrell Spray Pasteurizer outstanding for deep cream lines, cleanness and fine flavor.

Deep Cream Lines

Deep Cream Layers are promoted by the use of *low temperature heating water* and *gentle agitation.* Low temperature heating water can be used in the Burrell, because the water is sprayed in a rapidly-flowing sheet over *larger heating surfaces* —20% to 50% larger—than in other vat pasteurizers. Gentle agitation is accomplished in the Burrell by the wide, flat paddles swinging with a long, slow, sweeping movement, which forces every particle of milk across the broad heating surfaces by such a gentle motion that no churning or violent agitation results.

Low Bacteria Counts

Low Bacteria Counts are aided by the *simple sanitary construction* of the Burrell Spray Pasteurizer. Its plain, smooth interior surface is completely free from all bearings and stuffing boxes. There is no obstruction below the milk line to prevent thorough cleaning—just a smooth easy-to-wash and easy-to-dry surface.

Fine Flavor

Fine Flavor—the full natural flavor of the milk or cream—is preserved by the use of low temperature heating water which prevents scorching; and simple, sanitary construction which makes cleaning easy.

Write for illustrated catalog section No. 325. It contains the full story of the Burrell Spray Pasteurizer.

The "ARISTOCRAT"

OF BOTTLE CLEANERS

APTLY NAMED BECAUSE IT IS IN A CLASS BY ITSELF

Above cut shows TWO large ARISTOCRAT units consisting of independent 5-COMPARTMENT SOAKER connected to our latest hygienic BRUSHLESS WASHER with Sterilizing and 3-Compartment Cooling attachments. Photo was taken on the assembly floor of our large modern factory.

These units are now operating in the new wonderful plant of SIDNEY WANZER & SONS, INC., CHICAGO, ILL., where the best was the main consideration. Write us for full particulars. Our engineering staff belongs to you. 26 years experience.

Sheffield Farms selects Barry-Wehmiller Bottle Washers, Soakers and Sterilizers for their *new Jamaica*, Long Island Plant. After using 2 Barry-Wehmiller machines for more than 2 years in their New York City Plant, 2 more at the Brooklyn Plant, 2 more at the Harlem Plant, and 2 more at the Bronx Plant, all of 6 to 8 compartments in size, they have for the *fifth time ordered 2 more for their new Jamaica Plant.*

flexibility!

THE battery of four 400-gallon Cherry Twin Coil Pasteurizers shown above were installed in the Atlantic City plant of the Supplee-Wills-Jones Milk Company in June, 1924.

The flexibility of Cherry Pasteurizers is one of their important advantages. This feature is appreciated by the operators of this installation, for it permits an optional selection of time required for processing.

This installation has been operating nearly two and a half years and has been turning out a finished product with an average bacteria count of right around 3,000, with an excellent cream line and fine flavor.

No better or more economical system of pasteurization has yet been devised—and we would like to prove it if you'll let us!

THE FEDERAL SYSTEM of TRUCK EXPENSE CONTROL
Prepared for
M.L. PULCHER
PRES.

. . I have a plan on my desk that will help MILK DEALERS cut their hauling costs . . . . and it's free —

M. L. Pulcher
President

What's the use of keeping elaborate records of truck expense if they don't really tell you anything—if they don't help you do your hauling at less cost?

Federal offers you — without cost and without any obligation on your part—a very simple plan. It tells you how to know every day what each of your trucks costs to operate—and what the cost *ought* to be. It tells you how to keep your truck expense within bounds.

It's a plan designed for busy executives who wish a sensible basis for managing fleet operation. You have your finger on other departments — why not on transportation.

The Federal System of Truck Expense Control will stop all "guessing". It makes use of your own experience as a reliable guide in judging which type and make of truck to buy. It's yours for the asking, no matter how few or how many trucks you own, or what nameplate they bear.

Clip the coupon to your letterhead and mail it today. Get this money-saving plan. Follow the lead of some of the biggest fleet operators in the country who use and indorse this system.

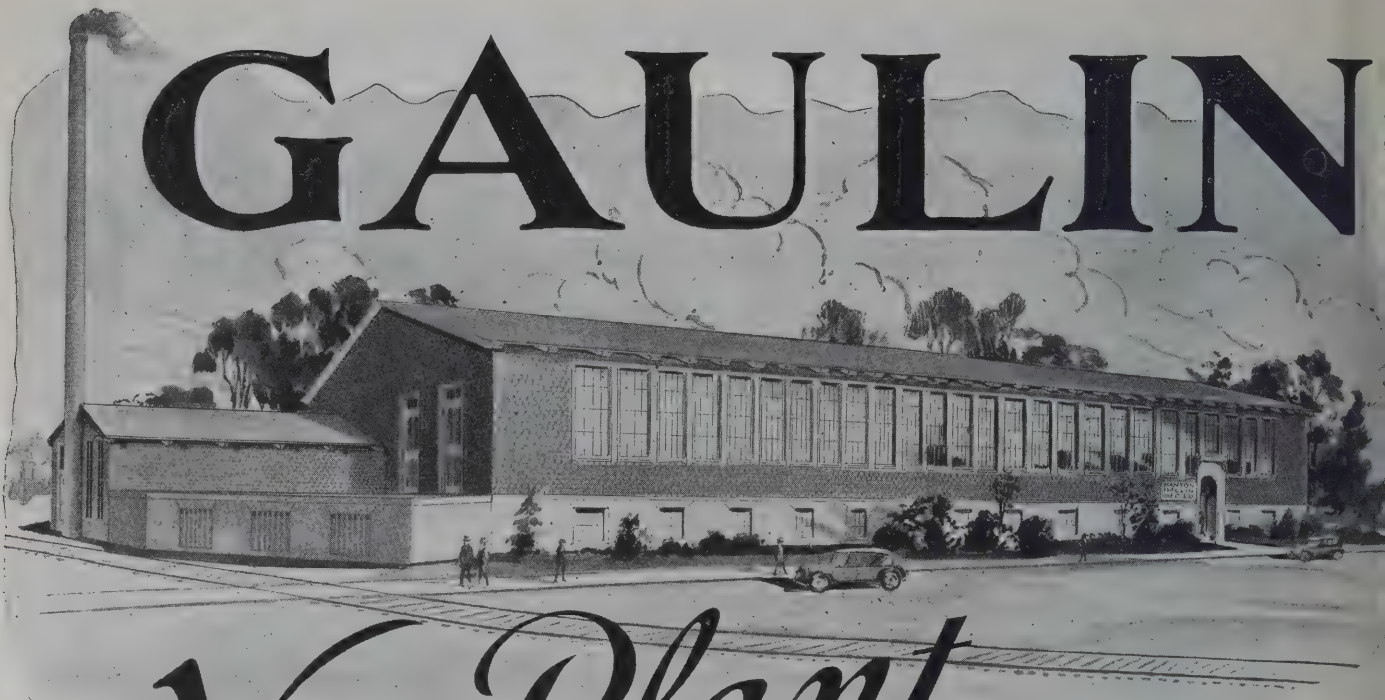
GAULIN



New Plant

24,000 square feet

wholly devoted to building

GAULIN HOMOGENIZERS

For 17 Years
Gaulin
Manufacturing Exclusively Emulsifying Machinery

Our force of Gaulin trained engineers and workmen will go to St. Johnsbury with us and will be augmented by local workmen whose skill in metal operations is well known.

Building is 196 feet long, 65 feet wide, with fireproof basement. Walls are practically all glass, providing splendid illumination. Machinery will be individually motor driven.

We operate our own water power plant of 200 horse power, which provides electric power and light for our entire factory.

ON or about September 15th, we move into our new plant in St. Johnsbury, Vermont. Besides giving us greatly increased manufacturing space, which was much needed, our new plant provides better shipping facilities, with a spur track at the shipping room door; and far better location of machinery and processes. Its modern layout and equipment will further enable us to build utmost quality and workmanship into every Gaulin Homogenizer shipped.

We cordially invite you to visit our new plant

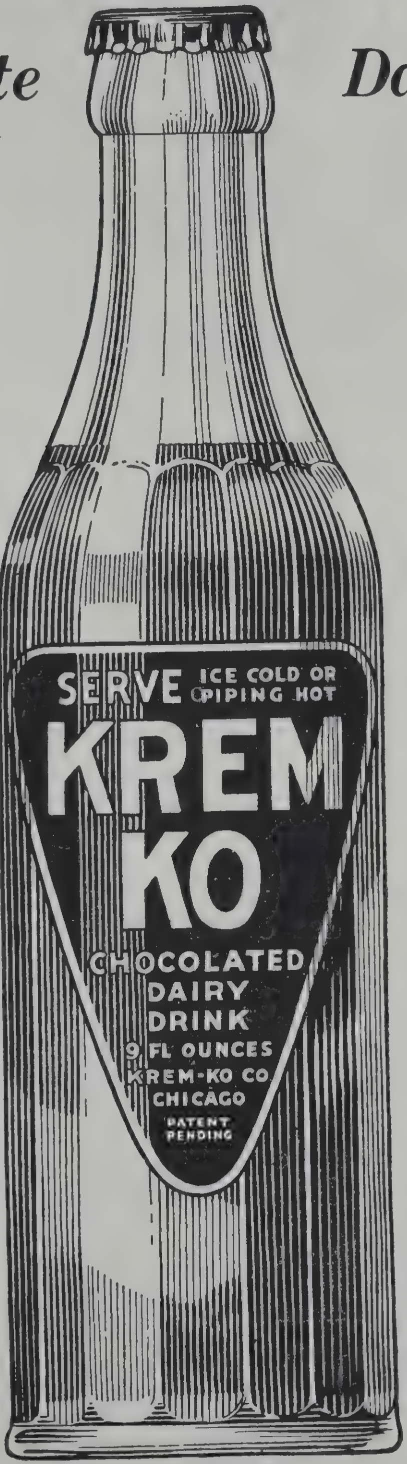
"The Most Popular Flavor in the World!"

KREM-KO

"The Chocolate Dairy Drink"



EVERY week, more well-known dairies join in this proposition that bids fair to make KREM-KO the most popular drink in the country.

And why shouldn't KREM-KO top the list? It has the most popular *flavor* in the world—milk-and-chocolate!

You can bottle KREM-KO. It utilizes skim milk, KREM-KO syrup, and the KREM-KO process.

KREM-KO does all that is claimed for it! It pleases. It "repeats" again and again.

The manufacture of KREM-KO takes the slack out of your present organization and equipment. We offer a complete plan of manufacture, selling, and advertising.

Chocolate never settles; never thickens.

Keeps without icing in any weather.

Can be bottled by any good dairy.

Popular drink the year round.

A good seller and sure repeater through fountains, lunch counters, road stands, pool rooms, groceries, and amusement parks. (Or through beverage jobbers.)

LEADERS in the INDUSTRY!

THE superior performance of the Yundt Air Brush Milk Bottle Washer has won for it the leadership in the bottle cleaning machine field.

Leading dairies have installed the Yundt Air Brush Milk Bottle Washer because of its quality and dependable performance.

A steady flow of clean, sterile, polished bottles are delivered from the Yundt Air Brush Milk Bottle Washer.

You, too, can secure clean, sterile bottles by installing a Yundt Air Brush Milk Bottle Washer.

Descriptive literature is yours for the asking.

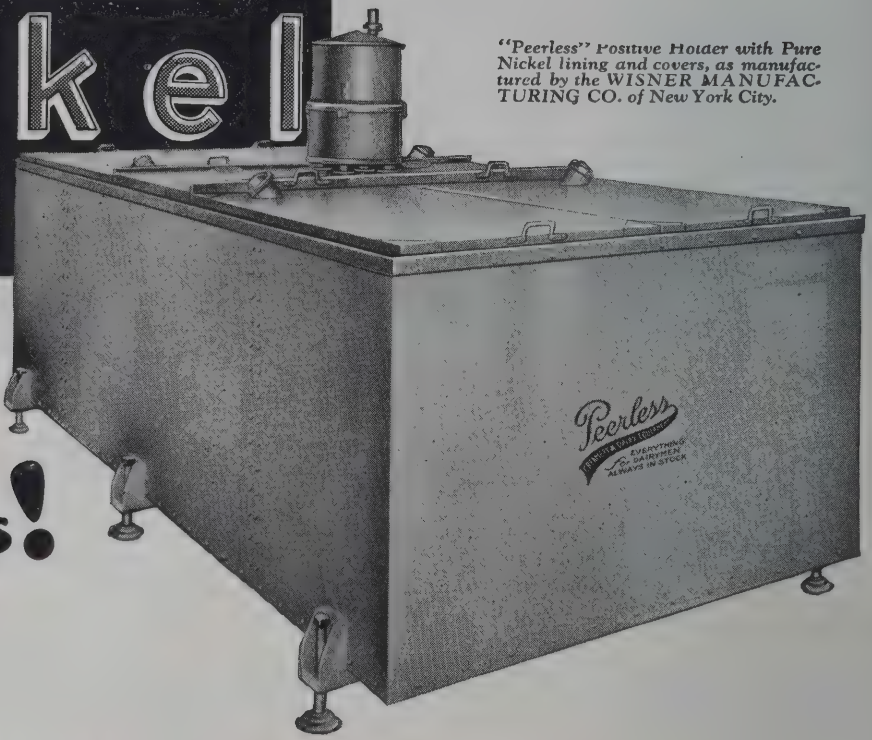
Wisner Manufacturing Company Adopts Pure Nickel



"Peerless" Positive Holder with Pure Nickel lining and covers, as manufactured by the WISNER MANUFACTURING CO. of New York City.

Now-a-days!

MODERN DAIRY EQUIPMENT IS NICKEL EQUIPMENT!

A LIST of dairy equipment manufacturers who are using Pure Solid Nickel in making pasteurizers, vats, coils, etc. reads like a "Who's Who" in the industry.

The Wisner Mfg. Co., makers of the well-known "Peerless" line, use Pure Nickel. In their many years of manufacturing experience, they have found it the most satisfactory material for dairy machinery construction.

When they fabricate Pure Nickel equipment, they know in advance that the user—their customer—will find it easy to clean and keep clean, and that it will aid materially in lowering bacteria counts.

The Wisner Mfg. Co. build long life into their "Peerless" equipment by using Pure Nickel. For Nickel resists the corrosive attacks of milk acids—it will not rust, and it has no coating to wear off under hard use.

Naturally, you want the most modern equipment. Consequently, you want Nickel equipment. Specify Pure Inco Nickel the next time you order. Ask your manufacturer for more information or write direct to us.

Ashley
CHARLESTON, S. C.

January 22, 1927.

CHERRY-BASSETT COMPANY,
2324 Market Street,
Philadelphia, Pa..

Gentlemen:-

Replying to your letter of January 4th regarding the new RUNNING*IN-OIL VISCOLIZER beg to advise that we have just gotten this machine installed and running and we believe it is the nicest piece of machinery of its kind that we have ever seen. There is no comparison between this machine and the old one we discarded.

We are going to be frank with you; when we were anticipating on buying a machine we had considered seriously of putting in another make of machine but since getting this one and getting it installed and running we would not exchange it for anything on the market. The class of work it is doing is indeed highly satisfactory and we are much pleased with the results. We are very grateful to your Mr. Linderman for selling us this RUNNING IN OIL VISCOLIZER.

Thanking you very much, we are

Yours very truly,
THE ASHLEY ICE CREAM CO.
J. G. Sherrer
J. G. Sherrer, President.

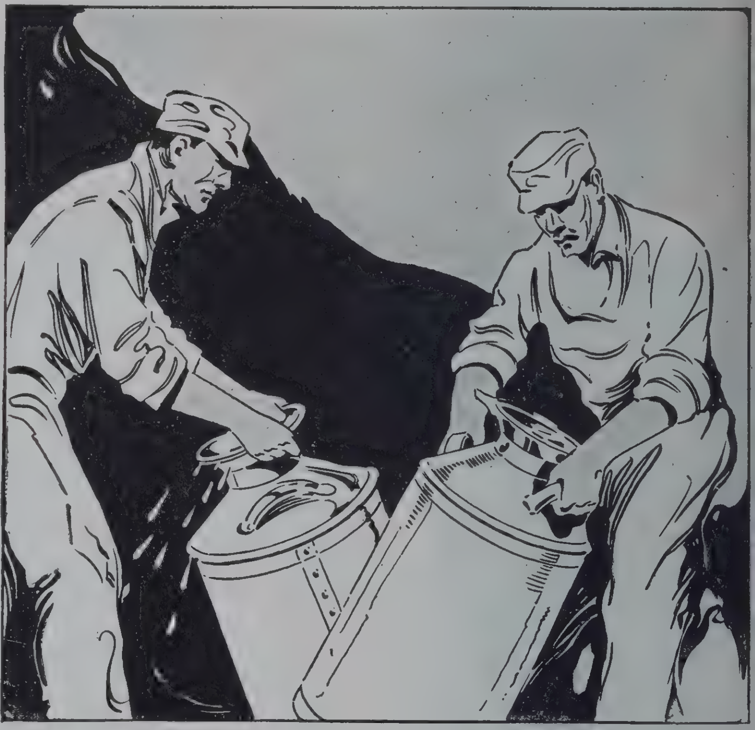
Seal Your Lost Profits

with Parchment Gaskets

Cream that slops when the can is "rolled" is lost—gone forever—and so is the money you would have received for it, if *Parchment Gaskets* had been used.



Nine reasons why you should use Parchment Gaskets

1. They prevent waste.
2. Reduce sediment.
3. Maintain a low bacterial count.
4. Save time in fitting lids.
5. Prolong the life of the cans.
6. Eliminate railroad claims.
7. Prevent cream from churning in lids.
8. Prevent contamination from "rusty lids."
9. Prevent sifting of dust between metal lid and neck of can.

Milk Can Gaskets are made from sturdy *Paterson Vegetable Parchment* from both 40 and 50 pound substance (50 pound recommended), size 11″ x 11″, fits any type can.

Write for samples and prices and circular No. 347, "Making Milk Shipments Pay."

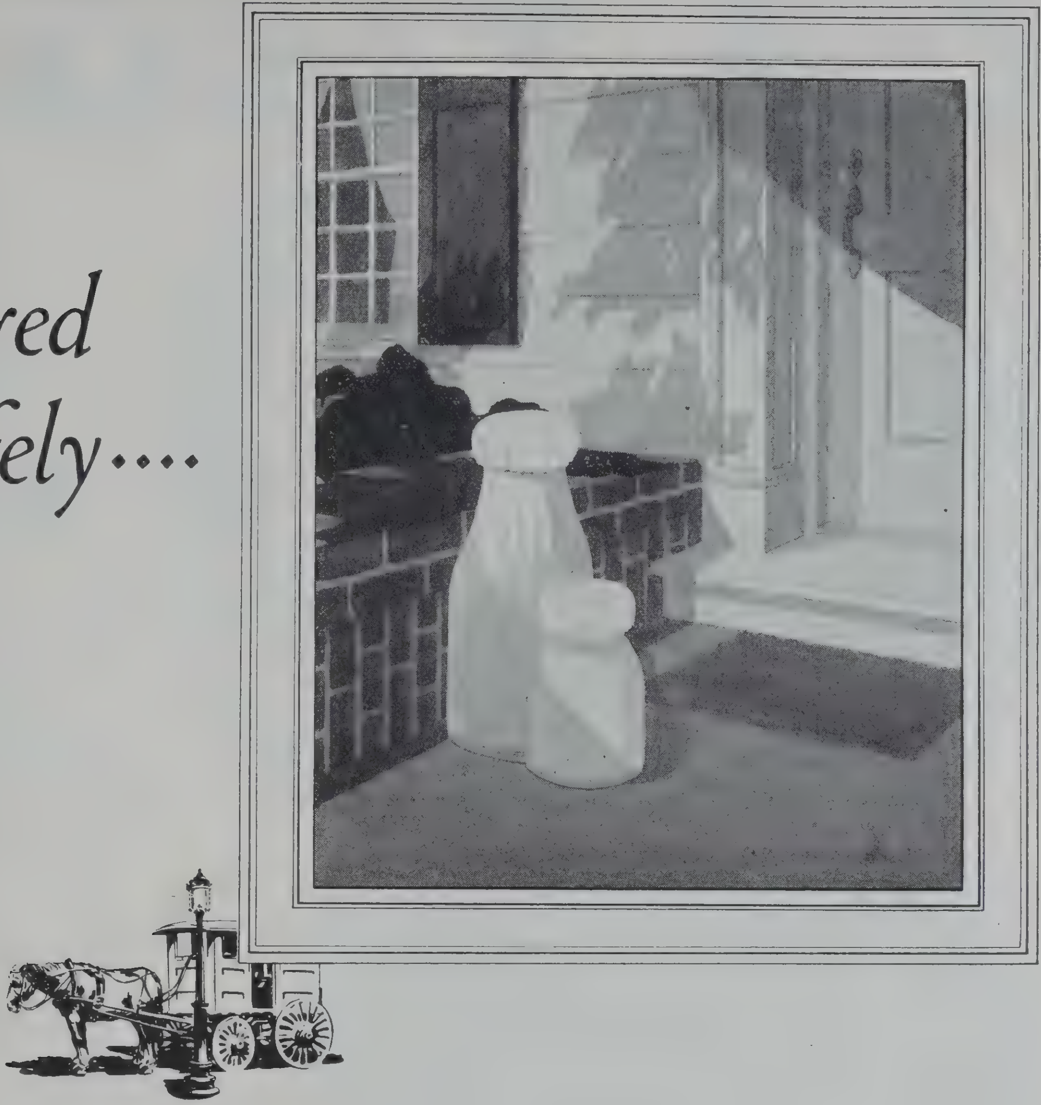
Delivered Safely....



YET that is only half the story so far as the careful housewife is concerned. She is much more interested in knowing that the milk is completely protected against any possible unsanitary conditions.

You can satisfy all careful housewives — absolutely.

For the Westlake Sanative Seal, made of five-ply pure pulp spruce paper, is air, moisture and contamination-proof. After being applied at the dairy it cannot be removed from the bottle and replaced without detection. It assures the customer a perfectly protected milk supply.

The Westlake Sanative Seal is moulded individually over the entire pouring mouth and lip of each bottle. It fits tightly, yet a simple turning and lifting movement is sufficient to remove it instantly.

Send for latest bulletin on "The Scientific Combination."

Niagara Falls—The Source of the Greatest Power Known to Man

The Miller HYDROSTATIC Principle of Sterilizing Bottles is now Standard the World Over!

TWELVE years ago Charles Miller became plant superintendent of the Bainbridge Bottling Company. He soon discovered that the general practice at that time in the beverage industry was to brush the dirt out of a bottle with an ill-smelling bristle brush, which soon became as filthy as the refuse in the bottle could make it, and while leaving the bottle in many instances clean to the eye, left it fairly alive with bacteria of all kinds.

Charles Miller immediately began to devote his entire time to the perfection of a machine that would rid his plant forever of this brush nuisance. Some important form of friction was necessary to remove the dirt. His thoughts at once turned to hydraulic or hydrostatic friction. He had witnessed the terrific action of water under pressure in engineering and mining projects, had seen hillsides torn away, boulders dislodged, everything give way to the tremendous power of torrents of water. He visualized this irresistible force turned loose on the inside and outside of dirty bottles . . . . . obviously, no dirt could resist it.

And so, with this terriffic force as a basic principle, Chas. A. Miller designed a bottle washing machine which has since revolutionized bottle washing in the beverage and brewery industries. And now the Dairy Industry, with its tremendous demand for clean, sterile bottles, is turning to the Miller Hydro, and finding in it a newer, better method of bottle cleaning, free from the mechanical ailments inherent in all brush washing machines.

Write us today for catalogue and full particulars of how the Miller Hydro can be made to pay for itself in your plant long before you make the last payment.

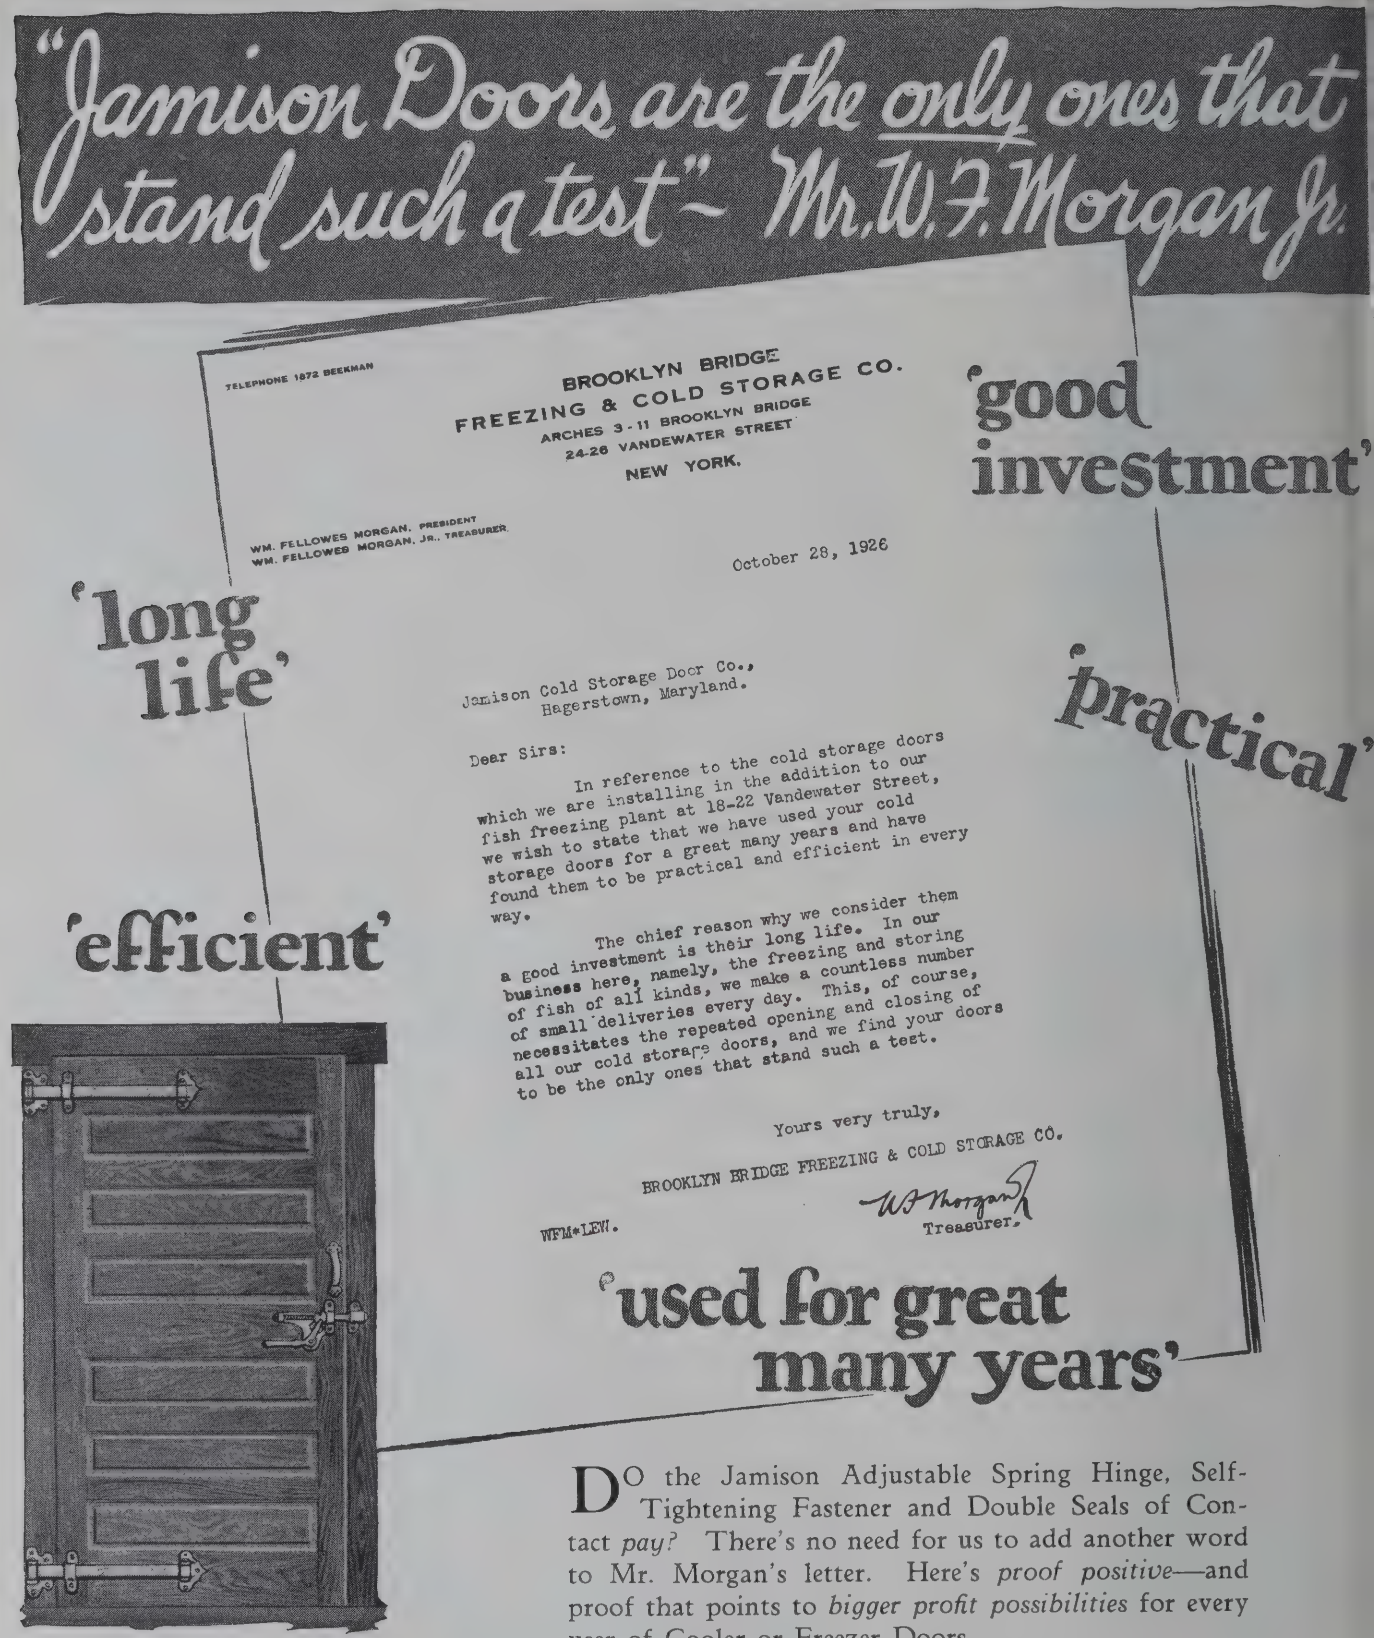
"Jamison Doors are the only ones that stand such a test"— Mr. W. F. Morgan Jr.



'good investment'
'long life'
'practical'
'efficient'
'used for great many years'

TELEPHONE 1872 BEEKMAN

BROOKLYN BRIDGE
FREEZING & COLD STORAGE CO.
ARCHES 3-11 BROOKLYN BRIDGE
24-26 VANDEWATER STREET
NEW YORK.

WM. FELLOWES MORGAN, PRESIDENT
WM. FELLOWES MORGAN, JR., TREASURER.

October 28, 1926

Jamison Cold Storage Door Co.,
Hagerstown, Maryland.

Dear Sirs:

In reference to the cold storage doors which we are installing in the addition to our fish freezing plant at 18-22 Vandewater Street, we wish to state that we have used your cold storage doors for a great many years and have found them to be practical and efficient in every way.

The chief reason why we consider them a good investment is their long life. In our business here, namely, the freezing and storing of fish of all kinds, we make a countless number of small deliveries every day. This, of course, necessitates the repeated opening and closing of all our cold storage doors, and we find your doors to be the only ones that stand such a test.

Yours very truly,

BROOKLYN BRIDGE FREEZING & COLD STORAGE CO.

W F Morgan Jr
Treasurer.

WFM*LEW.

DO the Jamison Adjustable Spring Hinge, Self-Tightening Fastener and Double Seals of Contact *pay?* There's no need for us to add another word to Mr. Morgan's letter. Here's *proof positive*—and proof that points to *bigger profit possibilities* for every user of Cooler or Freezer Doors.

Our Catalog—if you haven't a copy now—will bring you all the reasons why more than half the world's Cold Storage Door users own JAMISONS. It also describes fully the cost-cutting features of Noequal All-Steel Automatic Ice Chutes. It's a genuine handbook on plant efficiency. Write and tell us you want it.

OHMER

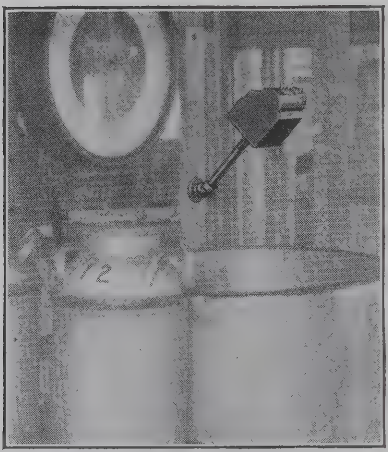
The printed record inside the regis is shown at the top. Below are tickets. Note how the figures on tape and the tickets agree.

Many dairies and creameries have found it unnecessary to keep journal and ledger accounts with producers. The OHMER No. 79 Ticket-Printing Register eliminates that task which often occupies the manager's time and energy when he could be doing more profitable work.



See how the register in the receiving room is out of the way, yet convenient for instant use.

Other OHMER Products

- OHMER ODOMETER gives accurate distance traveled by motor vehicles and railways.
- OHMER RECORDOGRAF gives a stylographic analysis of the operation of the vehicle on which it is placed.
- OHMER TRUCK AUDITOR produces complete printed record of the operation of motor vehicles.
- OHMER HUB-ODOMETER, an accurate counter for commercial vehicles. It goes on in place of hub cap.
- OHMER PRINTING TAXIMETER prints receipt for the passenger and produces locked-in record for the owner.
- ATCO TAXIMETER, accurate and most durable non-printing taximeter on the market.
- ATCOGRAF TAXIMETER produces a stylographic record of the movements of the cab.
- OHMER FARE BOXES, convenient and durable receptacles for fare collections.
- OHMER INDUSTRIAL COUNTERS are for use wherever accourate count is desired.
- OHMER recording instruments are leaders of their type throughout the world.

Easiest and Most Accurate System

The OHMER Register is installed in the receiving room. When a delivery of milk or cream is weighed, the clerk steps to the register. Then, in less time than it would take to write a receipt by hand, he *prints* a receipt. And the one operation also *prints a duplicate record* on tape locked in the register.

At any convenient time, the manager or his assistant gets the receipts and takes the record out of the register. The receipts are filed by account numbers and the duplicate records are held for reference. When the time comes to settle with a producer, the amount due is *calculated directly from the receipts.* No ledger account is needed.

Revolutionizes Accounting Methods

The advantages and savings of the OHMER Register are so plainly evident that it is being adopted rapidly by mil and cream companies. revolutionizes accountin methods—does away wit losses due to illegible writin —prevents disputes with cu tomers. There's no chance losing track of any materi received. There can be alteration or obliteration figures.

Investigate at Once

Ask us for specific informa tion about the OHME Ticket-Printing Register ar the method of using it. W shall gladly answer any que tions on the subject that o cur to you. It has been ou business for 29 years to desig and manufacture recordin instruments. With all th experience, we are in a pos tion to give you useful info mation. Feel free to consu with us. You will not placed under any obligatio

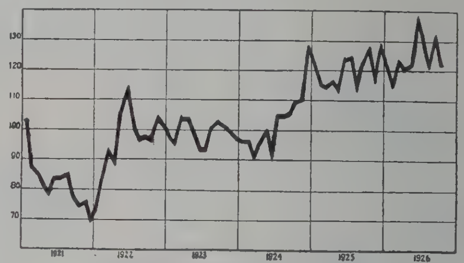
Mr. Milk Dealer—
What Are You Going To Do?

What was your good will loss last year? Last month? What percent of it have you regained? If any. Are your departmental costs right? Are you growing too fast? Too slow?

TEN million people have left the farms and joined the mad competition in the cities. Result—Farm products are going to higher levels and the purchasing power of the public is decreasing.



Increased Returns on Live Stock and Trend on Farm Products Still Upward

A narrowing margin on milk is certain. How will you meet the situation?

Our Organization Can Help You

Problems that confront you have been solved by someone. Have you a budget? How fast should your business grow? Can you, quickly, find your weekly profit and loss? Does your bank appreciate the possibilities of your business? Do you? Have you competitive problems? Have you the "guess habit"? Sufficient capital? Cost accounting system? Are your sales below the danger line?

Have you surplus problems? Do you wish to reorganize? Or sell your business? Does your milk show a fine cream line and has your cream a fine body? Have you eliminated theft in your organization? Do you know your daily shrinkage? How to cut merchandising cost without reducing country prices or raising city prices? Are you making enough money?

A MAN'S JUDGMENT IS NO BETTER THAN HIS INFORMATION. Tell us your troubles. Strictly confidential. We can solve them. Don't add to your plant until you have consulted us. Our methods increase capacity without additional equipment. We do not spend—we save.

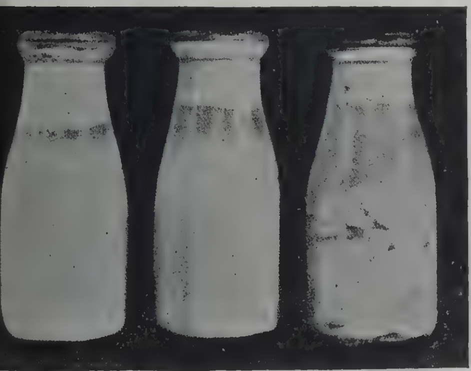
HE PROFITS THAT ARE WASTED-

NOT INTENTIONALLY-BUT WASTED NEVERTHELESS

The profits that are wasted present a great loss to you annually! Can you imagine an employee deliberately pouring your profits away—why you would fire him in a minute!

Yet the fact remains that many milk dealers still suffer a great annual loss just because of a poor cream line, broken down by their equipment. Still this is not junked.

Users know and experiments have further proven that Pfaudler glass-lined pasteurizers produce the maximum cream line. See the photo below for positive proof; then write for information!



Left: Three bottles of 3½% milk all of the same age were photographed 5 days after bottling. The bottle at the left with heavy cream line and very narrow streak of separation, was pasteurized in a Pfaudler pasteurizer. The center bottle was pasteurized in a competitive batch-type pasteurizer; the third in a continuous system, showing excessive gas in cream and solids.

Right: Two of the popular Pfaudler Pasteurizers. The smaller is the "C-Gal", made in 60, 100 and 200 gallons. The other is the "Closed Top", made in 200, 300 and 500 gallons. Either one will give you the maximum cream line!

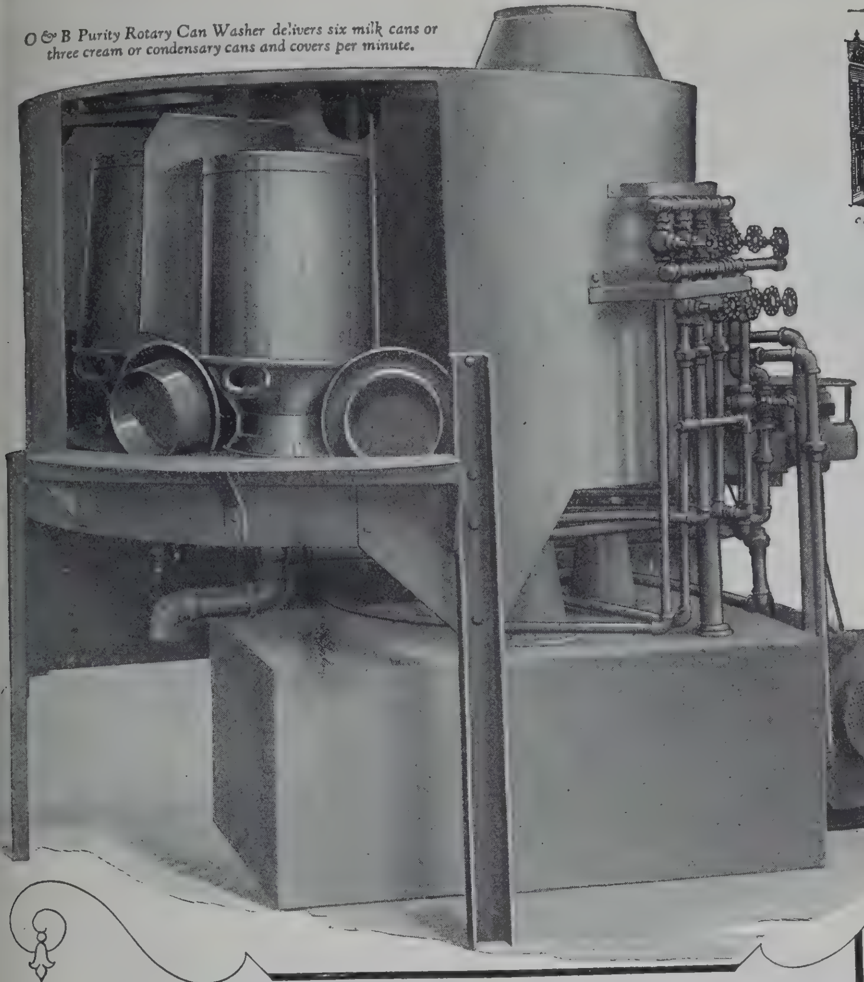
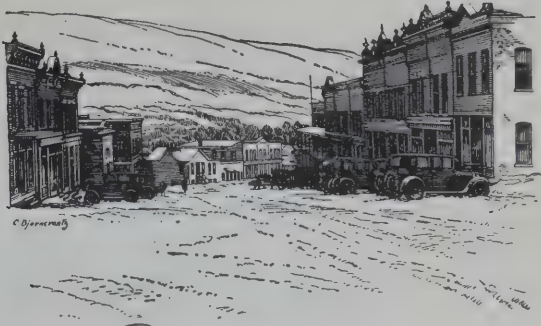
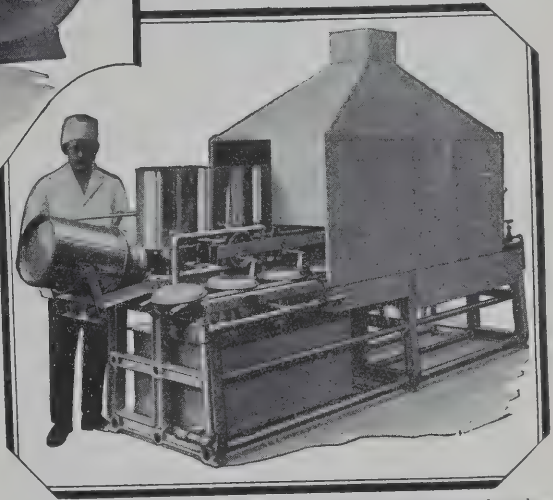
O & B Purity Rotary Can Washer delivers six milk cans or three cream or condensary cans and covers per minute.





Showing the main street of Cattaraugus and the surrounding hills in winter time. You are looking from the Erie R. R. Depot down the steep slope of the street which is in reality only part of the immense hill on whose breast the village is nestled. By this street comes traffic from Southern New York to Buffalo and usually you must "shift." Even in the winter, the hills across the beautiful snow-blanketed Cattaraugus Valley stand out grandly in the clear winter ozone.



The Armstrong Purity washes, drys and sterilizes without pumps of any kind. Simple, substantial and dependable. Just the thing for straight line installations.

A High Grade Washer is a Good Investment

THE O & B Purity Rotary Washer shown above is backed by years of practical every-day experience.

The only machine with a two-speed attachment. Efficiently handles both milk and cream or condensary cans and covers. It, therefore, possesses a much wider range of usefulness than the average washer.

Operates very simply and efficiently. Many new advantages. An exceedingly thorough washing action, delivering cans bone dry and sterile. Easily cleaned. Attractively finished. Shipped completely assembled—ready for immediate service.

The efficient O & B Rotary will prevent can rust, kill germs, keep milk sweet and improve the quality of butter and cheese.

It is a good investment. Investigate at once — write for our special proposition.

Steam . . . water . . . lactic acid have little or no effect on this special gravity conveyor. The braced sections resist rough treatment. The sealed rolls—water and moisture proof—assure cleanliness. They make it possible for daily steam baths and drenchings to really clean.

Dead rolls are almost unknown. For there are no ball-bearings to rust and dust away. A special bronze (non-roller) bearing guarantees that the rolls will always roll. The rigid construction planned to overcome milk plant difficulties . . . guarantees longer life. And a more useful life.

These are the reasons that so many nationally known dairies and so many ice cream makers insist on Lamson Sanitary Gravity Conveyor throughout their plants. You too, can cut your handling costs . . . speed your deliveries and keep your plant cleaner. Send a portion of this page with your letterhead. Union Engineering Co.,
Cleveland, Ohio

Gentlemen:

Regarding the Bestoval Bottle Washer we purchased from you and installed in our new plant on November 7th,1926, wish to say that this machine is performing very satisfactorily in fact after a few minor adjustments when installed we have had no trouble with it.

The bottles discharged from it are sparkling and clear and we would heartily recommend this type machine to anyone in the market for a large size bottle washer.

Yours very truly,

MCO:K THE PHENIX DAIRY.

MORE PROOF!

of the SUPERIORITY of the

CLEVELAND BOTTLE WASHER

MR. OLDHAM of the Phenix Dairy, Houston, Texas, after having carefully studied all makes of bottle washers for more than three years, decided on the **CLEVELAND** for his new plant, which is one of the largest and most up-to-date in the South.

He was thoroughly convinced that the **Cleveland Method of Pressure and Dormant Soaking in Conjunction with Clean and Sterile Brushes** would give him the cleanest and most sterile bottles to match his unexcelled product. Furthermore he knew that the Cleveland Bottle Washer was the machine for service due to its rugged construction and simplified design and this has been conclusively proven by the fact that **The Phenix Dairy erected and put their bottle washer into operation themselves without the assistance of any representative of the Union Engineering Co.**

The Cleveland Bottle Washers are Built in All Sizes and for Every Requirement!

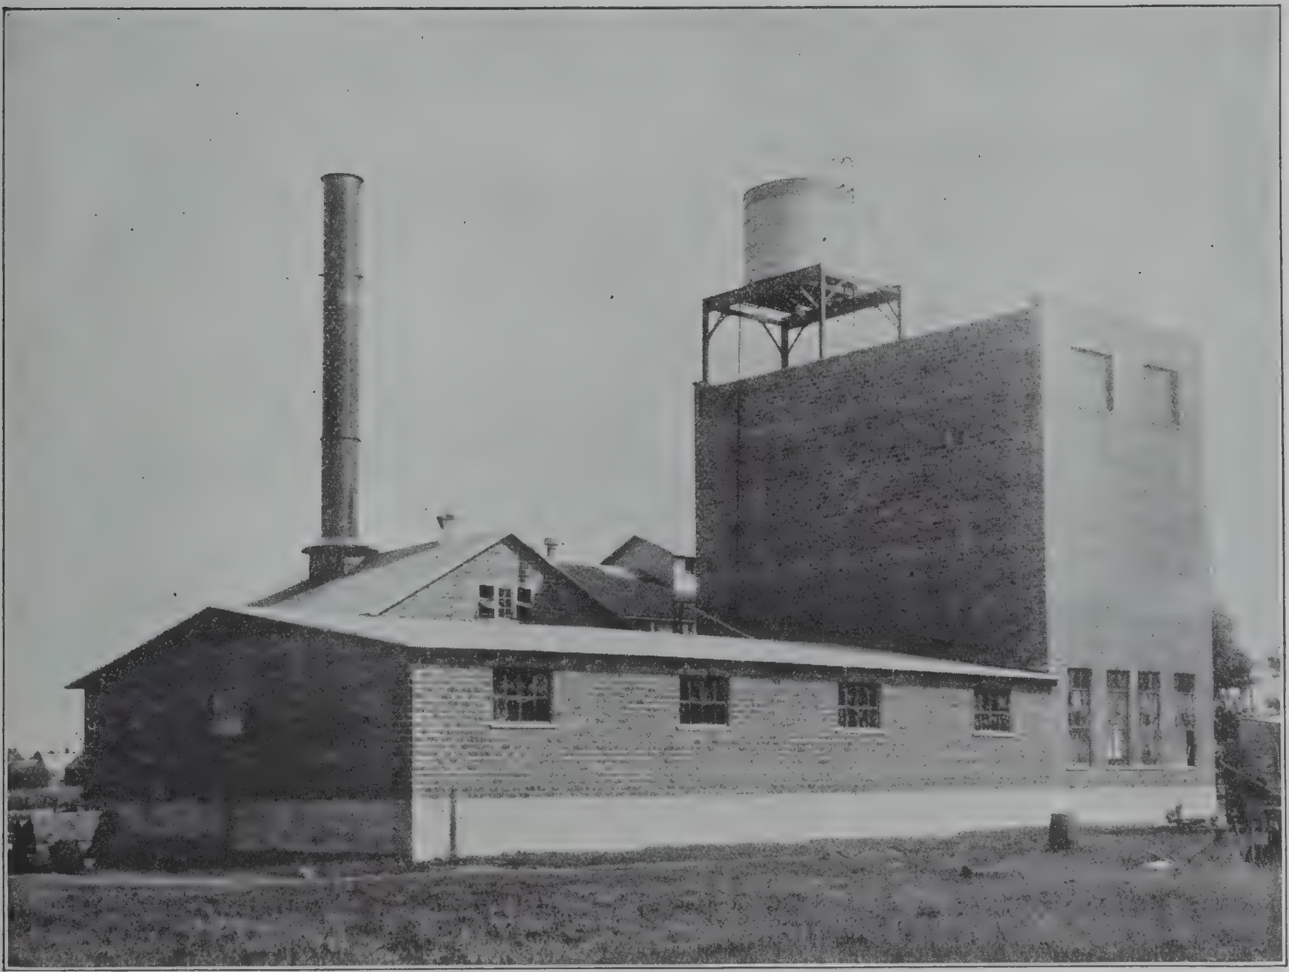
DOUTHITT MILK POWDER PLANT

GRAY-JENSEN SPRAY PROCESS

Designed and Built by

DOUTHITT ENGINEERING COMPANY

100 WEST MONROE STREET, CHICAGO



Sheffield Farms Company's plant at Lisbon, N. Y.

Add to your creamery profits by manufacturing your skim milk, buttermilk, or whey into powder on the Gray-Jensen Spray Process Milk Powder Plant.

The highly developed efficiency of the Gray-Jensen process results in recovery of milk powder actually equivalent to the solids in the milk, with lower labor, fuel and power costs than are possible with any other type of milk powder plant. These savings alone pay for one of our plants in from one to three years. Operating records prove this.

We can furnish an assured market for all skim milk and buttermilk powder made on our plants.

These plants are built in sizes to handle from 10,000 to 120,000 pounds of normal liquid milk or milk products daily.

Every Schoolroom in Your City Should Have the Message Which the Children in this Picture are Receiving.

An Opportunity for Milk Dealers—

Your milk business can be substantially increased through cooperation with the National Dairy Council in its established program of health education.

Schools (both public and private), Women's Clubs, Welfare organizations, etc. are anxious to secure Council material showing the necessity of dairy products for proper growth, health and efficiency. In hundreds of other cities over the country, this practical program has been beneficial to the local dairy distributors.

If you do not have these valuable avenues contributing to increasing your sales, you are missing a real opportunity.

Acres of Profits

IF YOU PLOW DEEP ENOUGH

TALK with those men who top the dairy products industries today and you will find in each and every case that they have plowed deeply for their profits—have used the right kind of top dressing, and plenty of it! "Plowing deeply" is the constant digging after market facts: needs, trends, developments. "Right kind of top dressing" is the use of the most advanced equipment, the most efficient machinery, the best supplies in production. Market facts can be discussed, trends anticipated, the most improved equipment seen and compared—best and inclusively—at the great Dairy Industries Exposition. Those who *top* the dairy products industries will be there as a matter of fundamental policy. Thousands more—tomorrow's industrial leaders—will also come. They are going to plow deeper, use a more fertile top-soil of proven facts and figures, reap *their* share of greater profits during the year to come!

World's Dairy Congress Official Liner—S. S. Leviathan, "The World's Largest Ship"

Are You Going?

A Survey is now being made to find out those who are planning to go to Europe in June, 1928

NOW is the time to start planning your trip to Europe to attend the World's Dairy Congress in London, June, 1928. It is not too early. Reservations must be made months in advance, for in the spring the tourist traffic to Europe is unusually heavy and last minute accommodations on this famous liner are practically out of the question.

A survey is now being made to find out how many people are planning on taking this trip so that adequate accommodations can be arranged for. If you are interested, please send in the coupon immediately. Complete information concerning rates, accommodations, sailing dates, tours, etc., will be mailed to you without obligation. Address all correspondence to

OFFICIAL ORGAN OF
The International Association of Milk Dealers
Dairy Products Association of Kentucky, Inc.

SEPTEMBER, 1927

BULLETIN OF EVENTS

National Dairy Exposition—The twenty-first annual National Dairy Exposition will be held at Memphis, Tenn., on October 15 to 22, 1927. It will be held in conjunction with the Tri-State Fair. General offices of the National Dairy Association are located at 910 S. Michigan Ave., Chicago, Ill.

Dairy Industries Exposition—The second annual exposition of the Dairy and Ice Cream Machinery and Supplies Association will be held at Cleveland, Ohio, on October 24-29, inclusive. Roberts Everett, 225 West 34th St., New York City, secretary and manager.

International Association of Milk Dealers—Twentieth annual convention to be held in Columbus, O., on October 19, 20, 21 and 22, 1927. The Neil House will be convention headquarters Secretary, R. E. Little, 228 No. La Salle St., Chicago.

Pacific Slope Dairy Show—Seventh annual exposition to be held from November 14 to 19, 1927, at Oakland, Calif. Secretary-manager, Robert E. Jones, 1404 Franklin St., Oakland, Calif.

Ohio Milk Distributors' Association—Annual convention to be held in connection with the convention of the Ohio Association of Ice Cream Manufacturers and the Ohio Association of Creamery Owners and Managers, at Toledo, on January 24 and 25, 1928. Commodore Perry Hotel will be convention headquarters. Secretary, W. A. Wentworth, 5 East Long St., Columbus.

Michigan Allied Dairy Association—Annual convention and exposition to be held at Grand Rapids the week of February 6, 1928. Hotel Pantlind will be convention headquarters. Exhibits and conventions in Armory. Secretary, D. W. Shiel, Hillsdale, Mich.

THE past few months have seen the passing of several men of great wealth and business power. They seemed to be indispensable in the general scheme of business until—

Yes, until they were gone. The gaps closed up and the great army of business moved on. They are all but forgotten.

Which all goes to prove that we are pretty "small pumpkins" after all. If you are ever tempted to swell up over some little success you have achieved it will do you good to keep this fact in mind. It will help you keep your feet on the ground, and that will be good for you and your business.

ONE of the big problems of the milk business is t
help problem. The element of human nature ente
into the business to a large degree. Human labor a
human initiative are the big driving forces in the bu
ness in spite of the wonderful development along m
chanical lines.

About the time an employee becomes fitted to a pa
ticular job he tires of it and starts out to find one mo
to his liking. There are many irksome jobs in the mi
business, and this may be one of the reasons for rap
changes by employees. This is not the big reason, ho
ever. The same foolish trait that prompts a cow
reach through a barbed wire fence to get grass that
not as good as that on her side of the fence also promp
folks to be dissatisfied with their conditions. The oth
fellow's job looks more attractive to a man thus afflict
than does his own. If he lives in Missouri he is su
he could be happy if he lived in Michigan, and if
lives in Michigan he is sure he could be happy in M
souri. Discontent which prompts a man to improve h
conditions of life is desirable, but discontent whi
merely makes a man miserable is quite another thin
Happiness is found in the state of mind, not in any pa
ticular state in the Union.

* * *

EACH year the progressive milk dealer spends a co
siderable sum of money for advertising. In additi
he contributes liberally to general movements whi
have for their purpose the spreading of knowledge co
cerning milk and milk products. All of this, in additi
to the sums of money he donates for purposes entire
divorced from his business. Taking everything into co
sideration he is a good spender.

He is always looking for new ideas. He is alwa
wondering whether he is getting his money's worth
his advertising efforts. He wants to sell more mil
and he is a firm believer in advertising, but he wonde
whether he is wasting some of his money.

He has good reason to suspect that perhaps he is n
getting "value received" for all the money he spen
for advertising. Business men seldom do. The value
certain advertising is not easily measured. There is
yardstick to lay up against it.

All men in business, however, appreciate the valu
of new ideas in advertising, providing they attract favo
able attention. The man or woman you want to rea
with your advertising is a busy man or woman. The
is much to command the prospect's attention in the
days of jazz, low-grade moonshine and high-priced co
metics. If your new idea gets favorable attention yo
may be assured it is a good one.

We consider this question of milk advertising o
of the most vital concerned with the milk bottling a
distributing business. It is linked so closely with sal
that we always have it in mind when talking of mil
selling campaigns. We invite your co-operation in di
cussing this subject.

The old theory of "each man for himself" is fa
disappearing from business. In its place is being plante

pirit of co-operation among men in the same line siness, and to their profit.

e invite our readers everywhere to tell us about rtising and selling ideas that have been successful. ember, we don't expect you to tell us about them in nce. It is only after you have tried them out that xpect you to divulge them. Then they are public erty, and surely you would enjoy passing them on ther men in the industry. Please let us hear from and we are sure you will be fully recompensed by knowledge that you have served your industry just much.

* * *

LADY friend of ours had occasion not long ago to spend a few days out in the country and she is all ited about the "pure fresh milk" she got to drink.

No, it wasn't certified milk, at least she didn't know t it was. No, she didn't know anything about the s, or the farmer who brought the milk. She just w that it was "pure and fresh" because the farmer ught it right to her cottage every morning in a tin ket. "Why," she said, "you could taste its fresh- s, it didn't taste like the stuff we get in bottles here the city."

We let it go at that. She is a perfect lady and we n't attempt to describe conditions as we have found m on some farms where "pure, fresh" milk is pro- ced to supply a temporary demand, and that the un- al taste of that milk might not have been due entire- to its freshness. She seemed happy, and we didn't ve the heart to disillusion her.

We would very much dislike to believe that this lady rly represents the average city milk customer, but re are too many like her. There are too many who lieve that the city milk dealer "does something to the lk" to make it less desirable as a food product. Yes, does something to it, but these good people don't give n credit for what he really does. They conclude that he is willing to spend money to "do something" to milk he must expect to profit at their expense.

You may not have many such among your customers. e hope you haven't, but if such is the case perhaps u have not spent enough money and effort to educate ur people. There are too many men in the milk busi- ss who are merely collecting and delivering milk. They llect it from the farmer, bottle it and deliver it to the stomer. Their buying problems and their delivery oblems take up all their time and effort. They don't ve time to "sell" milk.

Plant problems, under which may be included about of the thousand and one details that call for atten- n every 24 hours, must be attended to. Everything se can wait, and the problem of selling milk is one of ese. The customer gives his or her order for milk and e amount is set as low as actual need will allow. The dy of the house plans on how little milk she can get ong with instead of how much she can properly use. he result is just as low a gallonage for the dealer as s customers can possibly make it.

We have made the statement before in these columns that the selling problem is the biggest one confronting the milk dealer, and yet it is the one given least attention by many men in the business. Even when many of these men do give attention to sales they think only in terms of customers. Doing more business, with them, means taking on more customers. "Selling" their customers on using more milk is far from their thoughts.

Then, too, there are many men who think they are successful in their selling efforts when they increase the volume of milk sold this month over that sold last month. There is more to this business of selling milk than that. It is just as necessary to "sell" the customer as it is to sell the milk, and we don't count a customer "sold" when it is necessary for that customer to go out in the back woods to find what she believes is "pure, fresh" milk.

* * *

A GENIUS in Oklahoma has invented an oil spout which he advertises "for use on standard milk bottles or screw stop jars. A convenient and profitable line for jobbers, as it is not necessary to stock the bottles. Our inside fastening spout fits any size dairy bottle—U. S. or foreign."

Note that he particularly emphasizes the fact that "it is not necessary to stock the bottles." If this gentleman gets very far with his propaganda some of our friends in the milk distributing industry are going to stock up on bottles even faster than they have been doing. "Watch the oil filling station for bottles" may yet become a familiar warning.

* * *

READERS of The Milk Dealer who visited the Dairy Industries Exposition in Detroit last year need not be urged to visit the exposition in Cleveland next month. They know that the mammoth display of equipment and supplies that they will see there will constitute a course in dairy education all by itself. And officials of the Dairy and Ice Cream Machinery and Supplies Association tell us that the Cleveland exposition will far excel the one in Detroit in both size and beauty. Plan to be there.

* * *

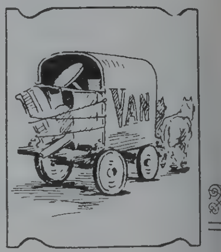
NEXT month's issue of The Milk Dealer will carry the completed program for the twentieth annual convention of the International Association of Milk Dealers, to be held in Columbus, Ohio, October 19, 20, 21 and 22. An unusually strong program has been prepared and all indications point to the best attendance in the organization's history. We strongly advise you to be there. You will be amply repaid.

* * *

IF YOU follow out the program that the majority will carry out you will attend the big convention in Columbus, Ohio, next month, and then go on to the exposition to be held in Cleveland the following week. Don't miss either. You can't afford it.

New Babies—Brides—New Resident

All Three Are "Good-as-Gold" Prospects for the Milk Dealer, Yet Few Dealers Plan Promotion Campaigns Especially for Each One.....



ONE exception is the Carver Ice Cream Company of Oshkosh, Wis., which, in addition to the product after which it is named, sells pasteurized milk, cream, cottage cheese, buttermilk and all the rest of the products handled by the average dairy. The plan which the Carver Company follows is simple, but effective. The dairy tells the story of its pasteurized milk to the mothers of new babies, to brides and to new residents with a slightly different slant for each prospect, so that the milk is shown to fit his particular need. The advertising medium is a personal letter, written in simple words, expressing a sincere desire to please and help.

The letters are multigraphed and filled in with the date and the name and address of the recipient.

As soon as the birth record is published in the Oshkosh daily newspaper, a letter like this is sent to the mother:

Dear Mrs. Adams:

Wouldn't you welcome a few words of important information that will help you protect baby's health during the first few months?

Baby's diet for some time is going to consist mostly of milk. And it is up to **you** to make sure the milk is absolutely wholesome and pure.

We realize our responsibility in helping protect the health of Oshkosh babies by keeping our milk clean. It is bought from selected farmers who produce milk under sanitary conditions. When it comes into our plant it is strained, and then scientifically heated **(pasteurized)** to destroy harmful bacteria. Then it is bottled and capped by immaculate machinery, in bottles that have been thoroughly washed and sterilized.

This process adds **safety** to the milk without removing any of its food value.

You owe it to baby to use only pasteurized milk. The records of the board of health and hundreds of Oshkosh people will tell you that **Carver's Properly Pasteurized Milk** maintains the highest standards of purity.

You can have any amount you wish delivered to your door, as often as you wish, by simply phoning 797 or 798.

May we help you protect baby's health?

Earnestly yours,
CARVER ICE CREAM COMPANY.
(Signed) By C. A. Carver.

After the list of marriage licenses has been published in the daily paper, the bride, who has just begun to think about the food she must prepare in her new kitchen, receives the following letter from Mr. Carver.

Dear Miss Prentice:

Congratulations on your wedding!

You're going to have a wonderful time making a home for your husband. And one of the most important considerations will be your milk supply. It's something that is a necessity every day. Your husband's health will depend upon the kind of milk you put on the table.

When you make the important decision on where to get the milk, you'll want to be sure it is pasteurized. In this process the milk is heated in such a was as to destroy all harmful bacteria.

In the Carver plant, all milk is properly pasteurized, a then bottled and capped by immaculate machinery in bott that have been thoroughly washed and sterilized.

This process adds **safety** to the milk without remov any of its food value.

If you want the best, order **Carver's Properly Pasteuri Milk.** You will find it rich and absolutely pure.

You can have any amount you wish delivered to y door by simply phoning 797 or 798.

Very truly yours,
CARVER ICE CREAM
(Signed) By C. A. Carver

The names of new residents are obtained from applications for meters. Soon after her arrival, the ne comer gets this friendly letter from the Carver Cream Company:

Dear Mrs. Marshall:

We have just heard of your arrival in town and we w to extend a sincere welcome to you.

Oshkosh is a city of fine homes and schools, and wh you become acquainted you will find that it is also a city friendly people.

But the everyday necessities of life cannot wait until y know your neighbors well enough to ask their advice ab where to buy things. So we want to add to your welcome the city some important information about your milk supp

We realize our responsibility in helping protect the hea of Oshkosh families by keeping our milk clean. The reco of the board of health and hundreds of satisfied Oshkosh p ple will tell you that Carver's Properly Pasteurized M maintains the highest standards of purity. Our process a **safety** to milk without removing any of its food value.

If you want the best, order **Carver's Properly Pasteuri Milk.** You will find it rich, absolutely pure and safe.

You can have any amount you wish delivered to y door by simply phoning 797 or 798.

Cordially yours,
CARVER ICE CREAM
(Signed) By C. A. Carver

P. S.—We'd like to have you look through our plant. is always open to the public.

"When we talk about proper pasteurization in co nection with Carver's milk, we mean it," says C. Carver, president of the Carver Ice Cream Compar "Our men don't merely go through the motions of pa teurization. No matter how busy we are, our milk heated to 145 degrees Fahrenheit and held there for minutes. We are ready at any time, to put our men the stand and they will be able to swear that we li up to the spirit and the letter of the pasteurizati regulations.

"We go out after new business, we get it and ho it on the same basis that we got and hold our prese customers. We keep them satisfied.

"In the dairy business, as in every other busines you will sometimes notice the work of a high powere promotion man, hired by the dairy, to pep up their bu ness. For a time the dairy will show tremendous i creases in business. But unless the dairy fulfills all promises in its advertising, both printed and by wo mouth, it will not—it cannot—hold its customers. ere will be a constant turnover. New customers will e the places of those who drop away, it is true. But dually those who drop away will outnumber the new tomers and the dairy, in the end, is where it was in beginning.

"There is only one way to hold business and that is live up absolutely to your promises about your prod-s and make your products so good that they deserve support of your customers. When a rival organiza-n solicits the business of one of your customers and says that she can see no reason for changing, then u have her completely sold on your products and your ganization.

"Our dairy, like every other, wants and solicits new siness. But we work just as hard at keeping our old ends satisfied and urging them to use more and more our products.

"Just recently we used a letter to tell them about e other products which we sell. From time to time had been getting requests for sour cream. Naturally do not have sour cream on hand in our dairy. But wished to accommodate our customers, so we con-lted our chemist and he said that he would be able to ake the cream sour artificially.

"We announced, in the letter, that we could supply ur cream now to any who wished it, and took advan-ge of the opportunity to tell them about our creamed ttage cheese, our buttermilk and our chocolate milk rink."

This is the letter which was sent to customers of the arver Ice Cream Company.

ear Madam:

In response to a demand from our customers for sour cream, we are pleased to advise that we are now in a posi-on to supply orders for sour cream on one day's notice, ither by telephone call at our office, or through orders placed ith our driver salesmen on our milk wagons.

We also desire to call to your attention the fact that our wagons carry the Frisco style **Creamed Cottage Cheese.** This tyle of **Cottage Cheese** is put up in 12-ounce packages (not 0-ounce packages) and retails for 15c. This is a very pal-table and delicious cheese. If you have not already tried his cheese you have surely missed a wonderful treat. We uggest that you put out a note for our driver to leave one of hese 12-ounce packages. This style of cheese is going over ig, judging from the repeat orders we are receiving.

Our wagons also carry what is termed as **Commercial Buttermilk.** The culture used in this **buttermilk** has been propagated continuously for about four and one-half years under ideal conditions, and, as a result, the **buttermilk** made rom this culture has a most agreeable flavor and wonderful keeping qualities. This **buttermilk,** being scientifically pro-duced, is absolutely pure, and we recommend it to our cus-omers as a healthful drink. The price is eight cents a quart. We feel satisfied that if you will place an order with our driver for a quart of this **buttermilk,** you will be a con-stant user and will derive a great deal of benefit from its use.

For the children, especially, and the grown-ups too, our delicious **Chocolate Milk Drink** is very refreshing. This drink s carried on our wagons in pints and quarts. The price is eight cents per pint and 15 cents per quart. Give this drink a trial and we know that you will be a steady customer.

In addition to **milk, coffee cream, whipping cream,** and the special items mentioned above, our wagons carry **Carver Pasteurized Sweet Cream Butter,** which we consider far superior to any other butter sold in Oshkosh.

"We have noticed the effect of this advertising to our customers in orders for butter, for cottage cheese, buttermilk and other products which many housewives had never before ordered from our drivers. Our letter corrected the impression of many that only milk and cream could be obtained by way of the back door.

"Our advertising is aimed at both the customer and the non-customer. The customer must be sold on the idea of using more Carver dairy products. She has proved that she likes at least one of them by continuing to use it.

"The non-customer must be sold on the idea that Carver products are the best for her needs," said Mr. Carver.

"From time to time we get out folders telling of the advantages of—pasteurized milk, for instance. We quote recognized authorities on the subject proving that pasteurized milk is free from harmful bacteria and perfectly safe for children, whereas ordinary raw milk is not.

"Folders of this kind are delivered with the milk to customers by the deliveryman, and through the mail to non-customers. The latter are especially important for they must be sold on pasteurized milk, whereas those already customers have proved that they want only properly pasteurized milk by buying from us. In advertising to the latter, we try to induce them to use more milk than they already do."

In the operation of their ice cream and dairy business, the executives of the Carver Company are not only watching the production department to see that high quality is maintained, and the sales department to see that the business increases satisfactorily, but they are also constantly on the look-out for "leaks." Mr. Carver believes that prosperity does not always mean large production and sales figures. Production may be above the average, yet the profits may be lower than normal.

To keep the profits intact, he has cut out donations. He politely but firmly refuses to supply milk, cream and butter for church suppers or lodge bazaars. He refuses to be convinced of the advertising and good-will value of such donations—features painted so brilliantly by donation committees.

"We have made it an absolute rule never to donate any of our products to organizations for re-sale at their social or business affairs," said Mr. Carver. "To give to one organization paves the way for requests from others. We play no favorites—we refuse all of them. Charity is a personal affair which should be taken care of by a personal fund. It is unfair that we milk dealers should be expected to give away the product from which we make our livings.

"Just the other day a friend of mine who happens to be a dentist, phoned me and said that his wife was on the supper committee for some lodge entertainment and he wanted to know if we wouldn't donate the cream.

"I happened to know him pretty well, so I asked him if he was fixing up the teeth of members of the organization without charge. He was rather surprised at my question. So I went on to explain our position—that we couldn't afford to give away milk and cream and butter any more than he could afford to give away gold inlays or bridge work. He saw my point immediately.

"I offered to quote him wholesale prices on milk and cream if his lodge would buy in wholesale quantities. I told him frankly that we would make the same proposition to him that we made to every other lodge and church organization—that we would charge him for the milk and for the bottles, and would deliver them to any place he wished at the hour they were needed. The morning following the affair we would call for the bottles and credit those returned against his account. We want the business of large gatherings like this—we depend on it. I told him so and he appreciated my position that it must be a cash proposition with us and not a charity one. We got the order then and there.

"The day after the lodge supper we called for the bottles. Our driver was there as early in the morning as he could conveniently get there.

(Continued on page 110)

The Romance of Milk Merchandising

Is This a Drab Business, Colorless, or are the Merchandising Possibilities as Bright as in Other Lines of Business?

By CRADDOCK GOINS

"TROUBLE with the milk business," said a friend the other day—and, by the way, it is funny how most of us in this business like to talk about trouble—"Trouble with the milk business," he repeated, "is, it is so blooming drab, dull, uninteresting—life's just a series of shifts of dirty bottles that must be cleaned, filled up and sent out again."

He sighed. So did we.

This man reminds us of the fellow who committed suicide and left a note behind saying he just got tired of pulling off his shoes at night and putting them back on again the next morning.

You will frankly admit that the milk dealer who looks at his business in the light of the man just quoted is just that—a milk dealer. He is not a dairy merchandiser. He is tied down to the mechanics of his industry. He cannot see the forest for the trees. He is so close to his business he doesn't see it—like a man who walks up to the side of a house and sticks his nose against the boards.

It is truly unfortunate—a condition of affairs that one must readily face—that so many of us in this industry are tied down to the narrow viewpoint of a "series of shifts of dirty milk bottles."

What an indictment!

Members of almost any other industry in the world have cause for viewing the matter in this way more than the milk dealer.

If ever there was a product that is part and parcel of the spirit of romance, that goes hand in hand with the adventures of fairies, that so appeals to the imagination as a magic beyond understanding—then that product is milk! Milk the builder of men! Milk the developer of little children! Milk the painter of rosy cheeks! Milk the spinner of fairy dreams! Milk the magic carpet of adventures!

When we consider possible merchandising angles for milk we come to one field that is fairly limitless, that is virtually unbounded. The man with an imagination can fairly turn himself loose—rampant when he engages upon the various avenues of romance in milk.

Of course, one does not have to start with the rich, green fields, where the manufacture of milk magic begins—where the properties of the sun and the soil and the air all go into a product that the cow receives and uses as her raw material in the manufacture of that wonderful fluid that saves babies, that makes little youngsters grow up and thrive and run about with color in their cheeks and laughter in their eyes and songs in their hearts and play in their very souls—a product that lends efficiency and skill to the artisan, to the brain worker, to the men who have to do with the world's works.

Yet, when we pass up, as readily understood, these wonder works of nature there are people who will argue for hours over the miraculous birth of Jesus of Nazareth!

This, we may say, is an everyday occurrence, and everyday occurrences are likely to become drab after time—just like the viewpoint regarding a "series shifts of dirty bottles."

All right, here are other everyday occurrences th we people in the milk industry will do well to envisi and capitalize upon. I close my eyes, tired and weari after a day's hard work, after a day's fretting a fuming with my grind of activities, a grind just as tr ing and vexing and palling to me, dear Mr. Milk Deal as your grind is to you.

Before my eyes, as a feeling of restfulness com over me, there drifts a picture of a dreamy white sn cloud, and on this dainty, dreamy cloud is a dain snowy, fluffy couch, and upon this couch is a dain fluffy, pink-and-white young princess.

Now, the picture is not necessarily literally true, b it is there. I swear it! I see it. I can't forget it!

It is there, of course, by suggestion. It is there the form of a healthy mind. Milk and soothing, co fortable restfulness! Milk the deliverer from the t tures of a nerve-wracked mind, the builder up of nerv of health, of vigor, of imagination!

That is the real picture.

Babies don't smile in their sleep, say doctors, whi only goes to show how silly very learned men can for babies do smile in their sleep, and this man, w lays no claim to knowledge of medicine, knows they and admits of no argument.

The healthy baby, that is, smiles, and milk plays part—plays a part just as it plays a part in health.

All right, here's another picture that comes to mind, though I am alone. My small son, age two, w means more to me than all the fine gold in the wor lies across the porch swinger, with the shadows cast a Southern sun falling across his rosy little cheeks, a his wavering little locks blowing hither and yon unde soothing breeze from the east coast, and his chubby lit legs stretch out across the end of the swinger; his face all aglow as the dream fairies unfold to him little pl events in his young life. Those fairies are there, a I know it and I can swear it—although the little b himself has been in the back bedroom asleep during these hours.

Now, that picture is as clear in mind as though saw it actually before me, and in the background, as thing proud and lofty and noble, is a great, gigan bottle of milk—symbolizing all that goes with the pea and health and contentment of our precious young.

Until the people of the milk industry can see pictur of this kind, instead of "a series of shifts of dirty mi bottles"—until then we shall be a long way from dai merchandisers.

Other people see these pictures. They should ha no more imagination than you. I can take the pictu of a box of prunes and wrap around it the drea romance of seven seas, or the fairy romance of all t fairies of childhood slumber, or the high adventure e cut-throats who sailed the Spanish main, or the lure d fascination of the far-away gold fields of the Yukon at called to men of courage, to men who would do and are.

Couldn't you do as much about milk—you who ould know a very great deal more about your business an I?

"I never shod a horse in my life," Elbert Hubbard nce said, "but I can write a better story about blackmithing than any blacksmith in Chicago."

Possibly it was because he knew the horeshoer sticks is nose so close to the hoofs of the animals that he ever has a chance to see the real picture of his work—f his service, for that is what the horseshoer sells.

"I never laid an egg in my life," facetiously remarked he famous Dr. Johnson once, "but I think I am a better udge of an omelette than any hen that ever lived."

This leads up to an inquiry that a correspondent has ddressed to me.

"All of your discussions of milk merchandising," tates this correspondent, "carry the subtle suggestion that the milk dealer should earnestly consult some outsider, some specialist in advertising, or merchandising propaganda, or such."

In answer to this query I can only say every article I have ever written on this subject has been a flat failure if it hasn't clearly shown that this writer believes every milk merchant should have a merchandising expert at his beck and call for counsel. He is just as necessary to milk merchandising as a family physician is to a family, as a good lawyer is to a firm, as a priest or preacher is to the Divine soul.

I was talking to an advertising man the other day who doesn't know beans about the milk industry. He saw me watching a dairy ad, and although I had not said a word, he looked up with a gasp and said, "Gad, how badly those people missed presenting that picture!"

The ad simply showed a row of filled milk bottles and said "Our milk is clean and pure. Sanitary Dairy Company."

Now, somebody had told that fellow that an ad should be brief and should contain the important facts about the product. How easy it is to go wrong when you think you are following instructions literally. Yet all he told was what the public naturally expects of all the milk it drinks, of all of anything it eats or drinks—cleanliness and purity!

This same milk dealer might as well have put on a frock coat and high hat and walked down the street shouting, "I am a clean, upright, honest citizen and I vote!" which is nothing more than the public expects of him as a citizen.

The work was skillfully executed, it is true. The bottles were lifelike.

If that same milk dealer had shown a picture of a pretty tennis court scene, with two pretty, spirited girls swinging racquets in a stirring set, their hair flowing, their cheeks glowing; their eyes sparkling, their healthy young limbs showing tense and eager, with the very spirit of health and vigor surrounding the scene, and with a huge bottle of milk holding up each end of the net—then that merchant's story would have been told more eloquently than anything he could have said—for the picture was there! We must have the picture!

What is the picture? Just health and all that goes with it,—fun, frolic, enthusiasm, exhilaration, intense happiness.

If the merchandiser were to want a catchy line for the scene he could write there:

"A Net Profit in Health."

Just five words. He could make it shorter—just the words "Milk for Victory!"

There are some several million people in this good old U. S. A. who spend some several million good old U. S. A. dollars every year for drugs. They are cheating themselves, of course. They imagine that medicine is going to cure something that is wrong with them. Nobody ever told them milk is medicine. The man who buys a headache tablet never was told milk could give him the right condition of health that would eliminate headaches. The man who spends millions on his stomach never was told that the milk habit, properly begun, would prevent his having that trouble. The girl who spends a good deal of her daddy's or hubby's hard-earned money on cosmetics never was told in youth that milk would keep the bloom in her cheeks.

We never saw our pictures! Life to us has been "a series of shifts of dirty milk bottles!"

People with money to spend—people who should be buying milk—people who should be buying more milk—all are waiting for the milk dealer to show them pictures. They don't know what they are waiting for, but they are, and until the milk dealers of the land arouse themselves and put before their people pictures of the floating clouds of milk and romance, we shall be far from the romance of milk merchandising.

So many of us still are selling "clean, sanitary milk." We need the merchandising milk counselor. He will tell you instantly people are not buying "clean, sanitary milk." They are buying health and happiness, sunshine and contentment, fun and frolic, diversion and amusement.

Study your sales problem now carefully. Think of the billions spent on the movies, on pleasure boats, on picnics, on books, prizefights, on golfing equipment, on tennis courts.

Is it not clear to your mind that this age in which we are living is an age of pleasure, an age of joy, an age of emancipated youth, an age for the preservation of youth and youthful fancies! If it hasn't, Mr. Rip Van Winkle, you better arouse yourself and study the editorial columns and the sport pages of your newspapers. Then you will discover that the people of this age want that which will give them more fun, more pleasure, more gratification—more happiness.

Then, get busy, draw your picture, put milk and pleasure on a silver platter—and present your product! You are dealing in new marts of trade. You are dealing with a people of romance and play. The age has gone when women wore underskirts, men wore high stiff collars and children played old one-eyed cat in the neighboring lot. The women don't wear much of any skirt today, and it isn't because they are any less modest, but because they are out for fun, and the short skirt enables them better to take part in play, in walking, in driving an automobile—even in sitting down! The men threw away the stiff collars the same time they threw away some of our old-fashioned, stiff-necked dignity, and now they are trying to be as youthful and frolicsome in their dress and their play as their boys. Men who used to be old at fifty, dried up and grouchy at sixty and dead at sixty-five now are playing golf at seventy-two and are laughing and kidding with their grandchildren.

This generation of ours is a most important study to the milk dealer. They are not interested in clean, sanitary milk in a day and time when they take those things for granted. The movies are supposed to be clean, for we have movie censors and a movie czar. Prizefighting must of necessity be clean and honest, because the day the women started going to fights was the day the promoters realized that the public no longer would stand for dirty, shady stuff, and it was the day the tobacco-

A Business Builders' Club

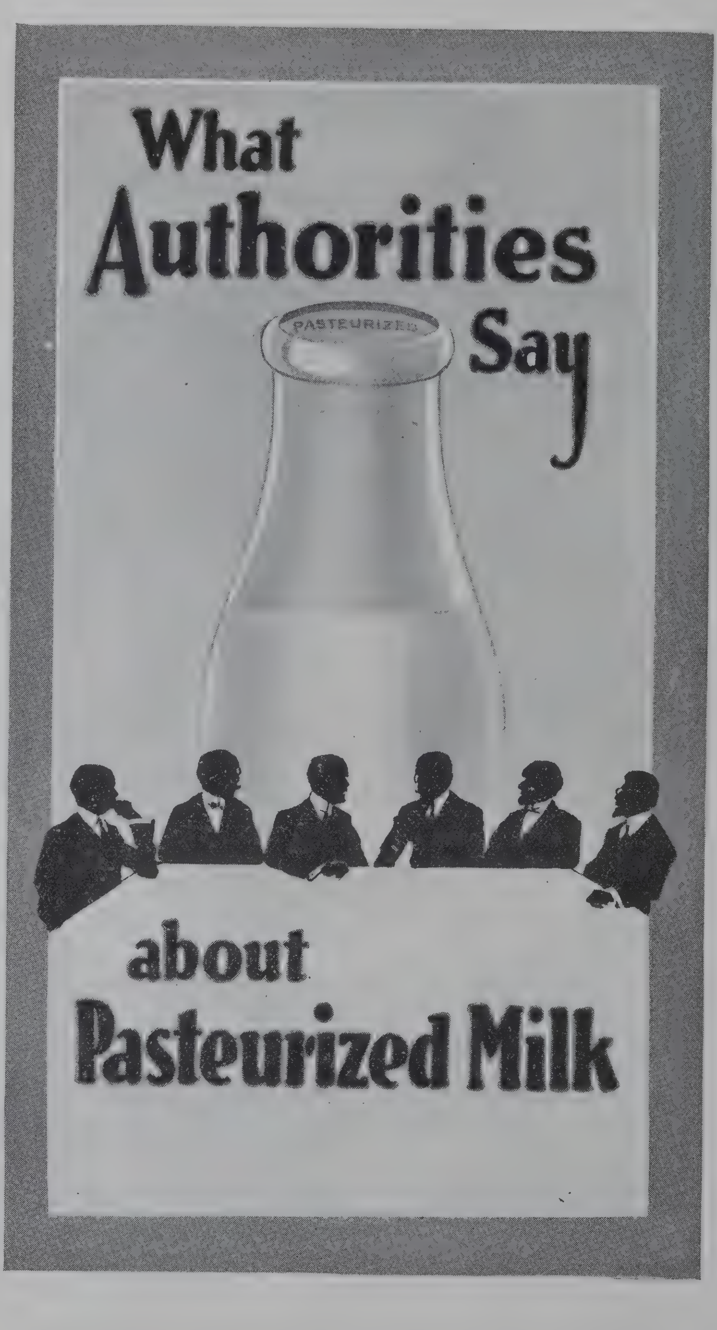
Employees of a Wisconsin Milk Plant Band Together to Promote the Interests of the Institution With Which They Are Connected

MANY dairy companies find it profitable to call their milk delivery salesmen together at intervals for talks by one of their officials or by someone outside the organization so as to make their men not only good deliverymen, but good salesmen as well. The plan has proved effective and profitable. One company is doing even better.

Up in Fond du Lac, Wis., the employees of the Fountain City Dairy Company have organized the Business Builders' Club — an organization conceived by the employees, developed by them and supported by them with the avowed purpose of stimulating the business of the Fountain City Dairy Company.

"We had wished for a long time that the employees would get together and form some sort of an organization in which they could thresh out their problems with each other," said E. F. Steffen, secretary of the Fountain City Dairy Co.. "We had had meetings of our milk salesmen from time to time. At these meetings we talked over the problems of our salesmen in selling our dairy products in Fond du Lac. Sometimes we had outside speakers. It was one of these, H. T. Gratz of Louisville, Ky., associated with the Sheldon Schools, who planted the germ of the idea of a club for employees.

"One day one of our delivery salesmen said to me, 'What do you think of the idea of everybody here getting together and forming a club?' I told him that I thought it would be a mighty fine thing and added that the firm would be more than glad to back a club of that kind.



"Other employees proved just as enthusiastic abou the idea as the executives of the firm were. In a shor time the organization was a going proposition with officers elected, committees appointed, a constitution an by-laws drawn up putting into words the purposes an aims of the club—and 36 members, a 100 per cent representation of employees of the Fountain City Dairy Co

"The members of the Business Builders' Club are no just our milk salesmen Every employee is an ardent member, from th stenographer in the offic to the bottling machin operator to the presiden of the Fountain Cit Dairy Co. The officers o the company vote just a the rest of the employee do. No job carries with i any special influence i the management of th club.

"Of course, there ar questions which come u from time to time, that ar of especial importanc and the executives an officials of the compan are consulted before th club proceeds along th particular line which it i considering, for after all the officials are the me who are responsible fo the spending of the company's money.

"But the Business Builders' Club is absolutely of the employees, b the employees and fo their mutual help in making the Fountain City Dairy Co. more prosperous.

"The man in the production end of our business now gets to see the production of dairy products from the angle of the milk salesman — a point of view which the average worker inside the plant would not get. He gets to seeing that his job is bigger than just operating te machine that caps the bottles, for instance—that the ttle capping operation is also a factor on which the ccess of the business depends, for it must be done ght to keep the customer satisfied and on the cusmer depends the success of our dairy.

"It is the milk salesman who comes in contact with ur customers — who gets their complaints and their raise. At the meetings of the Business Builders' Club gets an opportunity to pass along a possible comaint. Working together, the outside and the inside en will find a way to straighten it out.

"Often the delivery salesman will have a problem which he hasn't been able to find the solution. Somemes it will be another salesman who will tell him how e solved a similar problem, or it may be that one of e men in another department, with his fresh viewoint, who will find the key to the difficulty.

"The meetings of the club are monthly. They begin ith a dinner which is paid for by the Fountain City airy Co. and served by the employees. The food is urchased at different stores each month. The stores re assured in this way that we appreciate their patronge and are trying to reciprocate. We serve the diners at the plant, usually. They begin promptly at :30 and end at 9 for many of our deliverymen must go n the job early. In June we tried a new idea. One of he young ladies in the office, who has a country home, nvited the club to her home for the dinner and meetng. In August the meeting will be a picnic at a nearby ake to which the families and friends of the club memers have been invited.

"For the past six months T. J. Newbill of the Naional Dairy and Food Bureau has addressed the club bout once a month. His themes, naturally, were along he line of how to increase the consumption of dairy products in Fond du Lac, with practical suggestions to our employees on how to get the message across to the public.

"The officers of the Fountain City Dairy Company do not address the meetings except as do the other members of the club, when some question comes up on which they would like to express their opinions or when they have a suggestion to make on how to refute the argument of a prospect, or answer the complaint of a customer. The speakers are invariably men from outside the organization. Sometimes, when the talk comes from someone who 'has no ax to grind,' it has a slightly different ring than it does when it comes from one of the executives and the employees give the former sharper attention.

"The meetings are business meetings in the fullest sense of the word. The employees get together to accomplish something—to offer each other something which will help them in their daily work. Committees plan each meeting before it is held so that everything will run smoothly.

"The program and entertainment committee finds out about the speaker. If there is none, then they arrange for a little home talent entertainment—a sort of vaudeville act, maybe, or a simple game which can be played easily by a large crowd such as guessing the advertiser from just a part of an advertisement clipped from a magazine.

"At each meeting the various committees make their reports. The economy committee which looks for 'leaks' in the business brings up ways its members have discovered, in which the firm could save money. The new business committee reports on ways of finding and selling new customers. The service committee investigates ways of improving our service to our customers. The equipment committee—composed of men in the plant—looks into new dairy equipment which would either improve the quality of our products or cut down the labor necessary to produce them. The men on this committee, since they are in the dairy, are particularly interested in this phase of the club work. The clean plant committee is on the look-out for ways to improve our plant from the sanitation standpoint.

"The committee members have been chosen with an eye to their qualifications for the various jobs. For instance, the chairman of the economy committee is a conservative fellow, very careful about his own affairs. The same care is used in looking for extravagances in our plant.

"The enthusiasm of the members of the Business Builders' Club assures us that we have 36 people who are looking for ways to improve the service of the Fountain City Dairy Co., to build up its business and to cut down the overhead, instead of just the officials of the company. We feel the money we spend in encouraging the organization, in the monthly dinners, for instance, is money well invested.

Exterior View of One of Fond du Lac's Handsomest Dairy Plants.

"The problem of our buttermilk is typical of the type of discussion which comes up at the meetings of the Business Builders' Club. We ourselves were convinced that a cultured buttermilk was superior to the old-fashioned type. We began making the cultured buttermilk, and, of course, had a harvest of complaints from people who had grown used to the old-fashioned kind and who had decided they didn't like this change to a new variety. Some said they did not like the flavor—others said they could not cook with it.

"At a meeting of the Business Builders' Club we talked over the new buttermilk. The milk salesmen told about the objections they had run up against.

"We men who were responsible for the change told our employees just why we had done it—that we really believed that the new milk was superior to the old and that our patrons would prefer it after they had grown used to it.

"We told them that the buttermilk which was sold after butter had been made in it was part whey. They could prove this to their customers. They had seen the whey which settled to the bottom of such milk, leaving the milk on top.

"But the new cultured buttermilk was made from one per cent milk. The culture was added to this milk and allowed to grow. We convinced the men of the superior quality of the new product so that they could carry their enthusiasm to their customers.

"When it came to the cooking argument, we had several of the best known and most popular restaurants in town use the buttermilk in their cooking. They did so and it proved so satisfactory that our salesmen had a fine argument right there."

A similar example of co-operating to put over a Fountain City Dairy Co. product was in the round table discussion at a club meeting of its "Flake Cream Cottage Cheese." The dairy had been selling the old-fashioned cottage cheese, but changed to the cream cottage cheese which was prepared with sweet cream and ready to serve.

A proof of the success of the Business Builders' Club is the fact that its members have voted to assess themselves dues of 50 cents a month. This money is being saved against the day when the club members are going to gather at one of the big hotels with their wives and other guests to listen to a nationally known speaker on some phase of the dairy business.

Office of the Fountain City Dairy Co. E. F. Steffen, secretary, is seated in the foreground and Robert Beutler, general manager, in the rear of the room.

The constitution and by-laws of the Business Builders' Club follow. In a concise way they enunciate the aims of the organization and how the club operates.

CONSTITUTION OF THE BUSINESS BUILDERS' CLUB.

Organized, and Conducted by Employees of The Fountain City Dairy Company, Fond du Lac, Wis.

Preamble.

In order to form a permanent association for the promotion of man building, business building and salesmanship, by fostering the spirit of service in our lives and work, by recognizing and practicing ethical conduct in our business relations, and by establishing the conditions and environment conducive to the study of the principle of service and the laws related thereto which underlie and govern the art of profitable distribution, we do confirm and adopt this constitution.

Article 1.

This organization shall be known as THE BUILDERS CLUB of the Fountain City Dairy Company, Chapter of Fond du Lac, Wisconsin.

Article 2.

This Chapter is organized primarily for the study of "Salesmanship and Business Success," which is to be the official course of instruction used by all of the members.

It is intended that this Chapter, as organized, shall constitute a permanent educational department of the Fountain City Dairy Company.

Article 3.

Section 1. The officers of this Chapter shall be a director, an assistant director, and a secretary-treasurer.

Sec. 2. These three officers, in conjunction with the proprietor of the company, shall constitute an executive committee having general oversight of the affairs of the Chapter.

Sec. 3. The director, in conjunction with the members of the executive committee, shall appoint all standing committees and exercise general supervision over all of the activities of the Chapter.

The duties of the assistant director shall be to perfor all the duties of the director in the absence or inability of t director to act.

The duty of the secretary-treasurer shall be to keep t minutes of all meetings, the records and files of the Chapt and to conduct the necessary correspondence.

As treasurer, it shall be his duty to carefully preserve funds and disburse the same on the authority of the vote the majority of members at any regular meeting.

Sec. 4. All officers shall be elected by ballot at t organization meeting, and shall serve for one year, or un their successors are chosen and qualified.

Article 4—Committees.

Standing committees shall be appointed as follows (it b ing the policy that every member of the Chapter, as far possible, has some committee duties). They shall be follows:

1. Executive.
2. Program and Entertainment.
3. Economy
4. New Business.
5. Service.
6. Equipment.
7. Clean Plant.

Committee Duties Defined.

1. The executive committee's duties are outlined in Art cle 3, Sections 2 and 3, and they shall, in conjunction with th management, exercise general supervision over all the affai of the Chapter.

2. Program and Entertainment.—It shall be the duty the program committee to have full charge of the program each regular meeting of the Chapter. They shall also arrang and provide the lunch to be served before the meeting.

3. Economy Committee.—It shall be the duty of th members of the economy committee to make a study of was material, equipment, time, or energy, and report to the Cha ter well-thought-out ways and means of effecting savings.

4. New Business Committee.—It shall be the duty this committee to devise ways and means of increasing th volume of business, either through advertising or better sel ing methods. It is not expected that this committee sha direct the advertising and selling for the company; but the shall make a thorough investigation of what is being don and offer constructive suggestions as to how either may improved.

5. Service Committee.—It shall be the duty of this con mittee to make a study of any criticism of the service an make definite suggestions as to how similar criticisms may avoided in the future. They shall also make recommend tions to the Chapter as to the best policy to be pursued in th handling of complaints and satisfying of patrons.

6. Equipment Committee.—Equipment should be co strued as horses, harnesses, wagons, trucks, autos, plant m chinery, cabinets, etc. It shall be the duty of this committe to endeavor to suggest ways to improve on this equipmen also report all irregularities as to the use and cleanliness this equipment.

7. Clean Plant Committee.—It shall be the duty of th committee to endeavor to suggest ways to make the pla or the equipment more attractive, both to the workers an those who are served.

Report of Committees.

1. It is expected that each committee shall report, prefe ably in writing, through its chairman at the regular month business meeting of the Chapter.

2. Special committees may be appointed by the executi committee.

3. All committee work shall culminate in a report the Chapter at the business sessions. The Chapter will vo upon the suggestions made and the Chapter in turn will mak its recommendations to the management of the firm. Fin authority shall rest in the hands of the management at a times. Any employee or committee must sell its ideas to th club and the club in turn must sell its recommendations the firm.

Article 5.

Any employee, manager or executive of this compan may become a member of this Chapter by subscribing to th responsibilities for membership.

The pledge is, "I hereby promise to do all in my powe to help make a success of the Fountain City Dairy Compan Chapter."

Another noteworthy achievement of the Fountai City Dairy Company is its work among the school chi dren. Every Fond du Lac school child has visited th plant of the Fountain City Dairy Company. Far fro

"I Accuse the Milk Dealer"

Says our Mythical Member of Society who is Known Far and Wide as "John Jones"

MY NAME is John Jones. You don't know me very well. That's why I am jumping on you right now. I am one of your customers. You have right to know something about me, but you don't even ake the slightest interest.

When a fellow has money to spend he is sensitive bout this sort of thing. For instance, there is a cigar tore on a certain corner where I stop in frequently on ny way home from work. The clerk there not only nows me, but he also knows the kind of cigars I buy. He doesn't forget.

Of course, I can't expect the head of the milk company where I buy my milk to come out and single me out among all his customers and familiarize himself with me. He doesn't owe that to me any more than he does to anybody else. But he ought to know more about me, I feel, for I am a type. I am the American consumer of milk.

The other morning the driver who delivers the milk knocked over five or six bottles on the terrazo flooring of the hall of my apartment. I don't like to hear milk bottles break at that hour of the morning. Somebody down the hall yelled out something about "Stop that racket!" The driver snarled out something like "Go sit on a tack!" He was talking to me as well as to that man, though he didn't know it. In fact, he was insulting every buyer of milk—adding insult to injury as it were. I don't like that. For that man and I are one, so far as the milk salesman is concerned.

The other day we were shy a quart of milk. At supper I asked for another glass, and the madam said there was no more; that she had ordered an extra quart, for she was making some extra delicacies that day and needed more milk, but didn't get it. It's a small thing, but I don't like such indifference. Now just a few days ago this same guy was trying to palm off extra quarts of milk on us. I saw through it right away, and didn't get sore, because I knew he was just trying to increase his sales at that door, and I didn't bother about it after the madam told him we were taking enough for the present. Then it seemed he lost interest in us. I don't like for folks to lose interest in me, particularly the people with whom I am spending my money.

Now, here's another thing. I am not a finicky guy. I know my milk is clean. I know the laws of my state pretty well covering food products, and also the city milk ordinance. I am sure we are getting good, clean, wholesome milk. I wish my driver would follow out the part. Ever go into a soda fountain and order a drink from a soda clerk with a dirty, spotted, stained, soiled apron? That doesn't help your appetite much, does it?

Well, the other morning my milk driver stopped in late, on his way back, to leave a new card for the month. He came in while we were at breakfast. Somehow, as I watched him, noted his greasy shirt, damp, soggy overalls and unshaved face, I didn't take so much interest in my breakfast, and my little girl made a slight grimace as she picked up her glass of milk. My little girl and I are sensitive to appearances. So are many other people.

On my way across town the other day on business I passed the plant from where I buy milk. There was a dead dog in the street in front of the plant. Nobody inside had anything to do with it I suppose. Evidently not, for nobody inside seemed to care. Two fellows who work there came out, saw the dead animal, laughed and walked on.

If I ran that plant I wouldn't allow anything unclean in this world to lie about the front of my plant!

The public—and I am a component part of it, qualified to speak—doesn't like the sight of unclean things, and certainly doesn't like to associate this sight with dairy products.

At one side of the plant a man was coming out with two cans of very smelly milk. I haven't the slightest idea of what he was doing; possibly something pertaining to his regular duties. But if I ran a milk plant I wouldn't let anything of the unclean nature, no matter how necessary such things are, to come before the eye of the public.

I am broadminded. I can understand there is much waste in everything—much that is not nice. But I think it ought to be kept out of sight. We know there are sewerpipes under the sidewalks as we walk along, but we don't see the contents, and don't mind. We like to keep these things off our minds, like the smallpox, the note past due at the bank and the bill we owe the doctor.

Now, on the first of every month, or thereabout, I get a bill from my milk company. And they are awfully decent about it—too dern decent for their own good. I don't pay it right then. I forget about it—just like I forget about a lot of things I don't enjoy doing. In about two or three months when that bill gets so high I'm afraid somebody will raise Cain, I pay it. Of course I pay no interest. I have held back the milk dealer's money. He has had to pay his bills all along. All right, I think, if he is that sort of business man, I'll just get away with it. If he doesn't want to send me a polite reminder along about the tenth of the month, I'll just ride along. It's his little red wagon.

If that fellow knew me better, you see, it would be much to his interest. I'm not the best fellow in the world, for I'm just an average member of the public. We are a weak and a frail lot, we people of this human clay, and we are busy getting away with everything we can. Oh, of course, in the main we are honest. We don't steal anything red hot, nailed down or too heavy to carry, but we do dearly love to get away with things.

Now, just the other day a milk driver was telling me about this story. A fellow came to the plant, said he had a good scheme for selling milk. He got up a list of menus, for special milk dealers. He sold his idea to the proprietor. He would get up some local advertising to pay the cost of distributing these menus. Sounded good. The proprietor would pay very, very little. The fellow would get his pay out of commission for the ads. All right the list was printed—at a cut-price print shop. The menus were delivered. The fellow dropped in to say good by to the salesmanager. 'Oh, yes, he said, I just thought. A minute ago I collected for the last ad on this menu. Just five dollars. The baker down the street gave me a check for it. You can cash it, can't you? Sure.' "

Runaway Milk Bottles Mean Much Money

What a Modern Milk Bottle Exchange Can Accomplish for its Members. Chicago Exchange Handles 200,000 Bottles Daily

By H. H. SLAWSON

TO LOOK at an empty milk bottle it might be difficult for any one but a milk dealer to see in it one of the most habitual and most expensive runaways in the world.

Milk bottles, as every dairyman knows, never will stay at home. No matter how careful the milkman may be, some of his bottles are always turning up in somebody else's dairy, or more often remaining completely absent on roll call.

They wander from London to Hongkong, from Honolulu to New York, from Buenos Aires to Chicago, and from your town to the next place just down the railroad line.

To get some idea of what this singular wanderlust means the uninitiated would do well to drop around to a bottle exchange in any large city. Chicago claims to have the largest in the country and its operation is typical. In the Chicago exchange from 175,000 to 250,000 empty milk bottles are handled every day with an average of 200,000 bottles per day the year round. Put them into cases and stack them up in freight cars and you have the considerable quantity of ten carloads of bottles before you each evening. For a week's work at the exchange this would mean a train of 60 cars loaded with bottles.

Understand, too, that these are just the milk bottles which fail to return home properly after they have been left on somebody's doorstep. About 30 per cent, or 60,000 of the bottles received daily at the Chicago exchange, were rescued by junk men from the alleys and garbage dumps of the city. The other 140,000 of the day's "catch" have been brought in by the nearly 500 milk distributors who have found them in their plants at the end of the previous day. Under the association rules they are required to send them to the exchange for sorting out to the rightful owners.

How Dealer Brown's milk bottles worked their way into Dealer Smith's dairy is one of the perplexing problems which cause continual trouble and expense and perhaps bring old age early to the poor milkman.

Not a little of the responsibility is placed on the housewife who is indifferent to the property left in trust each morning on her doorstep. Some housewives have been known to sequester milk bottles especially during the pickling and preserving season. Maybe the old man of the house took a fancy to one or two which made him convenient holders for oil and other things down in the garage.

School children have been known to "swipe" the empties for the sake of pennies that come from the junk man. Sometimes janitors fancy them for like reasons. Once the Chicago exchange officials found a quantity being used by a concern dealing in strained honey. And in the East, it is said, mushroom growers use the empties for the propagation of the spores, then break the bottles to get their plants.

It costs the Chicago milk dealers $25,000 a month to maintain their bottle exchange as a co-operative service. If it did not exist, it is estimated that the loss to the industry in bottles that would never come home would be around $120,000 a month or close to $1,500,000 a year. Expenses are met by an assessment of 1.5 cents for each bottle returned to its owner.

Yet so completely do the milkmen feel that their exchange is worth while that after eight years in rented quarters, they planned for the expenditure of $500,000 to provide a modern plant for the task of sorting out each day's accumulation. A modern building was under construction during the summer. In it will be, among other things, a monster automatic bottle washing machine, costing between $80,000 and $100,000. This is claimed to be the largest in the world and it will wash sterilize and polish all the bottles that come its way to the king's own taste.

A labyrinth of conveyor machinery has been planned to aid in sorting the bottles. Belts will automatically carry Smith's or Brown's bottles across the room to the points where a load is being made up for Smith's or Brown's dairy.

About 100 persons are continuously employed in the sorting plant and 15 huge trucks are in constant use lugging the bottles back home where they belong. On the return trip another truck load of runaways is brought in to the sorting station to make a job for another day.

Every day in the assortment there are sure to turn up bottles owned by dealers in smaller towns surrounding Chicago. These they set aside until a load accumulates that would be profitable to send out to the exchanges operating in that particular area. Generally, too, the truck comes home with Chicago bottles that have gotten out of bounds.

Some interesting runaways drop in occasionally. In the cabinet of curios kept in the office one can, for instance, see a bottle bearing the name "S. A. Lavascongada, un litro, Buenos Aires." Still another is from "Rideau Heights Dairy, Moose Jaw, Sask.," while others hale from England, Canada, Cuba and the four corners of the globe.

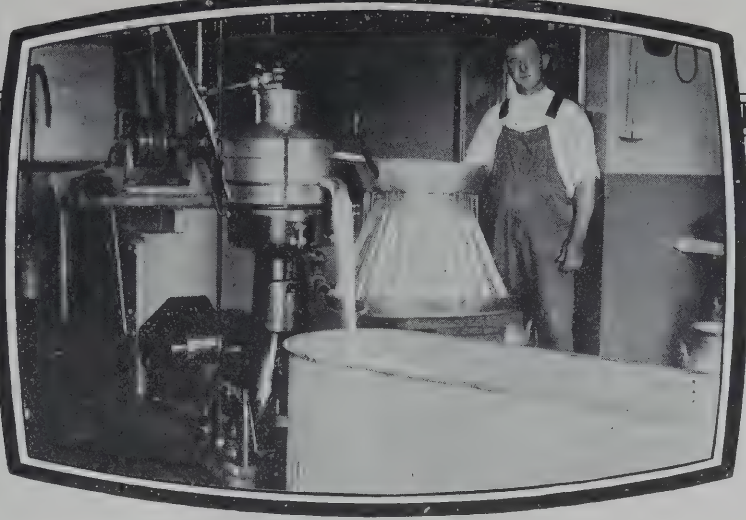
When the Milk Dealers' Bottle Exchange was organized in Chicago eight years ago for co-operative action to curb the tremendous losses in milk bottles, the principal object of attack was the "bottle bootlegger."

From many sources these business outlaws were collecting an average of three carloads of Chicago owned milk bottles every day and shipping them out of the city. Perhaps the car went to St. Paul, or Detroit, or Omaha, or wherever bottle dealers could be found willing to resell the property of the Chicago milkmen for the benefit of everybody but the rightful owner.

In the early days of the organization there was excitement aplenty. Officials of the exchange went out armed and accompanied by patrol wagons of policemen to recover the bottles from the unscrupulous dairies, or from freight sidings before the loads got under way. Statutes were put on the law books, and replevin orders and supreme court decisions obtained through the energetic action of the exchange leaders and now bottle bootleggers have been driven out of business in Chicago.

It has all combined to give the milk bottles a more steady stay-at-home character in striking contrast to their early manners. But think of the cost and the trouble that's caused next time when you toss an empty milk bottle out of your way!

The Best and Newest Equipment Is Advertised Consistently in The Milk Dealer.



No. 70 New Series De Laval Separator in plant of Emil H. Peters, Sugar Bush, Wis.

Better than the word "Sterling" on silver

THE name "De Laval" on a separator means more to you than the word "Sterling" on silver.

Ten or fifteen years ago 1000 silver dollars bought a good separator. Today, the same amount of silver buys a De Laval of larger capacity, much greater skimming efficiency and improved mechanical construction. In other words, the value of your silver has remained almost stationary while the value of the De Laval Separator has increased 50% or more.

Sterling silver, or commercially pure silver, remains a fixed standard of value because statesmen and financiers constantly strive to keep it so. Likewise, the De Laval has for half a century remained the world's standard of separator value because the world's most capable centrifugal engineers have worked unceasingly to improve and perfect its every detail.

You have probably never heard another separator compared with anything but a De Laval!

The New Series De Laval has made such comparisons more futile than ever. According to users these machines skim to 1/100 of 1% or less (Standard Babcock Test) with milk at normal temperature, and are in every other way the most wonderful separators ever built. That is the real test—what users say—not what we or any other separator manufacturer may tell you.

We have prepared a folder containing interesting letters from 12 users of New Series machines. Write for a copy.

Year 'Round Economies Tell the Tale of Successful Delivery

Keep Each Truck in Service Busy and Release as Many as Possible

By PHILIP L. SNIFFIN

DO YOU think, because you have a fleet of delivery cars which you can keep moving without waste during busy seasons, that you are doing all that can be expected to keep delivery costs down? How about those weeks and months when you have idle equipment on your hands, costing you money, if only for interest and depreciation, and producing not a thing to justify their keep?

And when a slow period comes around, do you keep the same number of delivery cars on the go, using them wastefully as so many concerns do, or do you try to apply a little science to the thing and cut down the number of delivery cars in service in proportion to the amount of work there is to be done?

That is one of the big leaks in delivery car operation today—a mighty scramble to keep up with schedules at any cost during busy seasons and a surplus of useless equipment with extreme waste during slack seasons.

I wonder with how many readers of The Milk Dealer that statement will "hit home."

True economy must be year 'round economy. The use of the delivery cars must be governed by the amount of work there is for the cars to do. Keep every delivery car busy at its maximum capacity while it is in operation. Cut down on schedules in slack seasons. Combine the schedules of two delivery cars when there is only enough work to keep a delivery car half busy during a day.

One of the biggest opportunities for greater profit in delivery equipment lies in equalizing the use of the equipment over a full year's time.

Let us point out a few examples of how this may be done. The users of small delivery car fleets can get good ideas from the big concerns who have solved the problem.

Here, for instance, is a concern that uses 88 delivery cars. A system of maintenance has been established which is really a model for year 'round efficiency.

A "Full Year" System.

Five delivery cars in the fleet are maintained as reserve delivery cars. All others are given specific routes and their work is planned always ahead of daily requirements. Of these five reserve delivery cars, two are held to replace cars assigned to the repair shop; two to replace cars in the paint shop, and one in reserve for accidents or bad break-downs.

During holiday and heavy delivery seasons this garage reserve is withheld from the shop and used to re-inforce the delivery fleet.

In any lull in deliveries an extra delivery car is withdrawn from delivery service and put through the paint shop, so that each car goes through the paint shop once a year.

Three spare bodies are in service to allow this number of regular bodies going through the paint shop continually. By this method three weeks can be allowed to repair and paint a body and the chassis is held in the paint shop only one week.

Territories are classified as Beach, Suburban and City. The first two years of its service, a truck is assigned to beach work, covering from 60 to 100 miles a day, and making 80 to 120 deliveries.

The next two years this delivery car is on suburban work, covering from 30 to 50 miles a day. From the end of that period for the balance of its service it is on city work, and covers about 20 miles a day.

Maintaining a fleet covering this range of territory, and furnishing reliable, consistent service with a small reserve, requires close supervision and attention to mechanical condition. This is obtained through a system of regular inspection and spare replacement units.

The oldest delivery car in service is maintained in sufficiently good condition so that in case of need it can be put out on a beach trip.

During the first two years a delivery car is operated it covers from 20,000 to 25,000 miles, and except in case of accident is maintained entirely on inspection service. At the end of that time it usually requires regrinding and some overhauling of transmission, differential, etc.

The delivery car then goes into suburban work, and for the next two-year period it is again maintained by inspection. At about the end of the fourth year the delivery car goes through what is known as a detailed overhaul. The amount of work being done at that time depends upon the length of time it is planned to keep it in service. The economical life of the delivery car in this service is from five to seven years, depending upon the total mileage, the type of work, the number of stops and starts, and the drivers it has had.

The night inspector spends one or two nights on a car, replaces miscellaneous small bushings, spring bolts, brake assemblies, clutch plates, steering gears, or any units that can be completed in one night. As a rule, on the exchange of any of the larger units, this work can be planned ahead and done by the day crew on the next regular inspection period, or on a day when deliveries are light.

This system is a complete and practical method of providing a balanced delivery car upkeep system. Its economy lies in the fact that work is scheduled scientifically to be evenly distributed over a full year's time. Thus a repair force can be maintained as a steady unit, its cost standardized and an adequate number of delivery cars to meet daily requirements is assured.

Judging Year's Requirements.

A concern has one vital condition to consider before deciding when to buy and when to rent a delivery car. That condition is whether purchasing a delivery car will involve enough idle time in the course of a full year to make up for the difference in cost between an owned delivery car and one that is rented when extra equipment is needed.

Perhaps the problem can be best expressed by "How can we handle our hauling during the busy season and at the same time have a minimum of empty delivery cars on hand during the dull season?" Roughly speaking, there are three ways in which this may be done.

1. If we figure the rush season hauling requirements

100 per cent, it is not difficult to estimate a percentage it will represent the dull season. For instance, an ner might find that his average low hauling requirents are 50 per cent, or half of his highest average. such a case, he might install a 75 per cent equipment nsisting not necessarily of all delivery cars, but as ny cars as he can profitably handle in his business, pplemented by teams. During the rush season, he y put on an extra shift of drivers, working his deery cars more hours per day and overload very occanally if necessary. There are serious disadvantages this plan, however, unless measures are adopted to feguard against them. Overloading and subjecting e delivery car to severe grinds are not ordinarily to recommended as a general policy since higher reir costs and depreciation more than make up for the ving effected. But as a temporary measure during sh seasons only—provided the season is not too long if the owner has purchased high grade equipment and lubrication, inspection and other items of maintenance re are considered accordingly, experience has shown at this plan can be used satisfactorily.

2. Perhaps the most completely adopted method ed is that of purchasing sufficient equipment to handle e normal business and then renting additional delivery rs or teams as needed. For the most part this is a asonably efficient plan and where it is possible to rent uipment on short notice at a reasonable cost, it may generally recommended. Very roughly, it may be timated that the cost per day of a rented delivery car slighly more than double that of one owned by the mpany, assuming, of course, that the latter is kept sy for a full working year. On this basis—and the dividual owner may readily determine the comparave costs in his own case—it may be seen that when he s enough work to keep a delivery car busy for half of e year, it is more profitable to own a delivery car than rent one. However, this plan reduces idle time to absolute minimum and the company whose business subject to gross uncertainties or intermittent expanon, will do well to adopt it.

3. The third method of equalizing these conditions quires, in a sense, that the owner enter the general livery business as a sideline. Although this plan may em undesirable at first consideration, the writer's atntion has been directed to innumerable instances here it has been exceedingly profitable. Under this an a member of the firm devotes his entire time in ll periods to obtaining contracts in commercial deering at the regular delivery car rates. Through this an he receives the maximum service and economy om his equipment. He has sufficient equipment availle at the lowest cost when needed and at the same ne his vehicles earn a substantial profit when he has work for them to do. The plan has been found in any cases to have the desirable effect of equalizing e business and income—in other words, when condions are generally slow, the members of the firm—or the case of the smaller concern, the proprietor—may vert their attention for the time being to the delivery siness which requires no special knowledge other than gressiveness in obtaining contracts.

Base Delivery Cars on Yearly Needs.

Hundreds of concerns have lost heavily and have verely jeopardized their businesses by blindly going to the delivery car market, installing a fleet of delivery rs, and then expecting them to accomplish wonders no atter what task they were put to. They were told and own that it is cheaper to own a delivery car than to nt one, so they bought enough cars of sufficient capacity so that they would not be forced to rent at any time.

That, briefly, is the most expensive mistake a business man can make. He can "kill the goose that lays the golden egg," so to speak. There is, unquestionably, a place for the horse in many businesses, principally because a horse-team represents a much lower investment than a delivery car and consequently its fixed carrying charges are considerably less. In many cases, especially where hauls are very short and where traffic is just as economically. But there is, too, a definite and very important place for the delivery car. In general, however, it may be said that for most hauling requirements, the horse-drawn operator will do well to make a careful investigation of his individual hauling conditions before deciding to discontinue their use entirely.

Selecting the right delivery car involves first, a complete dependence upon the reputation and reliability of the manufacturer rather than upon the physical appearance of the truck. If familiar with engineering details, the owner should make a careful study of comparative specifications, otherwise, he should look to performance records of longevity, dependability and economy. First cost is far from being the most important cost in the end, since the successful delivery car purchase is one that renders efficient service at the lowest cost per ton mile **over a period of years.**

Regarding the most economical size of delivery car to install, it may be well to point out that per unit of capacity hauled, the first cost, maintenance costs, operating costs—in fact, every item of expense—decreases as the size of the delivery car increases. A prominent delivery car authority places the average relative cost per ton mile as follows: One and one-half ton delivery car, 16 cents; two-ton delivery car, 13 cents; six-ton delivery car, 7.5 cents. It can be seen, therefore, that when unit hauling costs are considered, it is more economical to haul in large delivery cars than in small ones. However, it is possible to waste more than enough carrying capacity to make up for this saving by installing a larger truck than the average daily loads require. The matter is one requiring individual thought, inasmuch as it is affected by the nature of the business. It should be remembered, however, that where loads are uniformly large and where routes traveled will warrant it, a few large delivery cars are more economical to operate than a greater number of small delivery cars. There are instances, to be sure, where small delivery cars have greater advantages.

Change Routes to Meet Needs.

As mentioned at the beginning of this article, the owner can, in slack seasons, by careful routing, reduce the number of equipment units required, thus cutting down on drivers' wages and all other expenses connected with operating such unnecessary equipment.

The first thought in routing is the elimination of duplicated service. Zone delivery — calling for division of the hauling area into zones, with regular schedules for each delivery car, allowing, of course, for rush requirements when necessary, has been found to be a very practical basis. With the larger businesses and where the trade area is regularly concentrated, this feature of delivery car operation has the greater economy advantages. But regardless of what the conditions are, it is true that the milk dealer who goes over his territory carefully, and studies the best ways of handling his delivery cars on definite routes, will find a substantial saving between this and a method of handling the work in an irregular way, making shipments individually as required.

Teaching the Consumer to Appreciate Mil

Housewives Learn Something to Their Advantage. The Modern Dairy Believes in Propaganda

By One Who Was There

"LOOK! That cow is getting a permanent wave." The exclamation from the audience of housewives stopped the lecturer and he signalled a pause to the operator of the motion picture machine.

The familiar looking apparatus in the picture was, of course, only the automatic milking device used on plenty of up-to-date dairy farms, but it was one of many surprises to the hundred women who were being tactfully educated to a confidence in and an appreciation of bottled milk. A friend had telephoned me:

St. LAWRENCE MILK

Kiddies Take Trip Through St. Laurence Milk Plant.

"Will you join the ladies of our church on an inspection trip through the dairy? The St. Lawrence has promised us help on our organ fund if we can get 200 persons to visit the dairy."

I wasn't going to miss anything, so I was one of the crowd assembled at nine o'clock on the designated morning. The next two hours were crammed full, too. First, in convenient groups, we were conducted through the dairy and saw the handling of the milk from the taking of samples for the laboratory as soon as the milk trucks were unloaded, through storing in cold brine-jacketed tanks, separation, filtration, pasteurization and cooling to bottling and refrigeration.

"I never knew before why we have to pay 13 cents for the milk the farmer gets only eight or nine cents for," exclaimed one visitor to another. "See what it must cost to deliver it to us! That huge bottle washing machine there must have cost hundreds."

"Thousands," corrected the dairyman who was explaining the various steps in the care of the milk.

Seated in the little assembly room, we listened to talks by the dairy chemist, the manager and the young woman on the staff who—but her part comes later.

We viewed motion pictures showing the care of equipment, cows, utensils and milk on a certified farm; learned something of the rigid requirements as to location and construction of stables, cleanliness and periodical testing of the health of the cows. We saw t cotton filter discs, the covered type milk pail a watched several of the laboratory tests that safeguar the purity of the milk and determine the farmer's ratin on his milk's quality. We understood then that th bottled milk the dairy sold was safe and were ready t believe it the best and most economical food.

In the next talk the most knowing of the housewiv learned something new, and most of us a great dea The lecturer explained in detail just why plenty of mil should be included in the diet of everyone, but especiall in that of growing children. We were taught its bod and brain building and nerve benefiting value. (Aft the talk several ladies, trying to be causal about it, aske if "drinking milk wouldn't make them fat?" The were gravely assured it would tend to restore to norm condition, making the underweight person heavie helping the—er—over-plump ones to maintain heal and vigor while cutting out fat-producing foods.)

Most helpful to us mothers were the charts and fi ures showing how experiments on dozens of boys ha proved how valuable are butter and milk as body buil ers and how much better children who were given mi and butter withstood the usual diseases than did t children without this addition.

Plentiful were the comments and animated the d cussion in the next quarter hour while a dainty lun —cottage cheese salad, buttered crackers and bottl milk—was served. Miss Immer, the young woman charge of this part of the program, was kept bu answering questions and taking addresses so she cou mail us recipes for milk desserts, cheese salads and so

Mothers talked over their problems with one anoth

"I just can't get Arthur to drink milk."

"The way I trained Grace was——"

Or, "I never had any trouble with my three; only never before realized how much they need. I'm goi to order more this very day."

"I wish my Mary would...."

Next year I'll wager the plaint will be, "How wil ever get milk enough to satisfy these children?"

For:

Miss Immer gave every child in the city a chance find out, Where does it come from? and What good d it do me? They have all had their "Whys?" answer During the summer Miss Immer visited the 18 pla grounds of the city with two milk trucks, collecting youngsters who wished to visit the dairy—find a who didn't!—and taking them through the "works They went even to the roof where, in the sunny labo tory the chemist makes his mysterious tests for "bugs and the huge milk bottle towers.

Then she led them to the lecture room for the mov and a talk in words they could understand, with a lit treat of milk they drank from a bottle through stra And a chance to crowd around the cages of white r used for experimenting with various diets. The childr could see plainly enough the milk-fed rats were plum est and sleekest. So these thousands of youngsters wo again need to be "sold" on the milk idea.

To the Dairymen of America

Sealright Announces SEALON

The most practical Hood Cap ever made

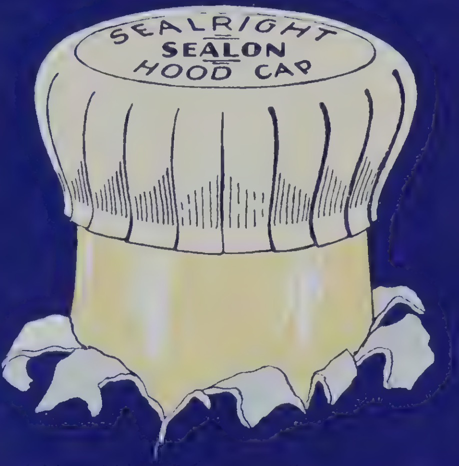
REALIZING the growing demand for better protection for all bottled milk, Sealright set out to produce a hood cap possessing none of the disadvantages of hood caps now on the market, yet offering all of their advantages *plus*. Today, after four years' research, study and experimentation under all conditions, Sealright offers the dairy trade the most practical hood cap and hood capping machine ever made.

Sterilized at 280°F

The Sealright "Sealon" Hood Cap is super-sanitary, being electrically sterilized at 280°F. at the moment of application to the bottle. It absolutely seals in the purity of your bottled milk, safeguards it from contamination as well as from all possible attempts to dilute it outside of your plant. This new hood cap completely covers the upper portion or "roll" of the milk bottle, giving it positive protection from dust, dirt, germs or any foreign matter.

Self-Sealing and Tamper-Proof

The "Sealon" Hood Cap is self-sealing. It is held in place on the bottle by an invisible seal and is absolutely tamper-proof. It cannot be removed without breaking the seal. It can be taken off with perfect ease by the consumer and replaced as a dust-proof cover. But it cannot be removed and replaced without detection.



SUPER-SANITARY. "Sealon" protects entire top of bottle.

SELF-SEALING. The invisible seal does it!

TAMPER-PROOF. Cannot be removed and replaced without detection.

AUTOMATICALLY applied by "Sealon" Machine.

STERILIZED at moment of application.

SAVES LABOR.

Automatically Applied

The "Sealon" Hood Cap is made in one piece, of pure spruce cap board, water-proofed by a new, exclusive process without the use of wax, resin or other flaky substances. It is automatically sterilized and applied by the Sealright "Sealon" Capping Machine—a marvel of simplicity, efficiency and economy (described on back of this page).

Meets Public Demand

Pure, protected bottled milk is what every housewife is looking for today. The new Sealright "Sealon" Hood Cap will enable you to meet this demand because it is the last word in bottled milk protection. Read about the Sealright "Sealon" Capping Machine on back of this page and do not fail to see it in operation at the Dairy Exposition, October 24-29, inclusive (Booth 144).

SEALRIGHT CO., INC.

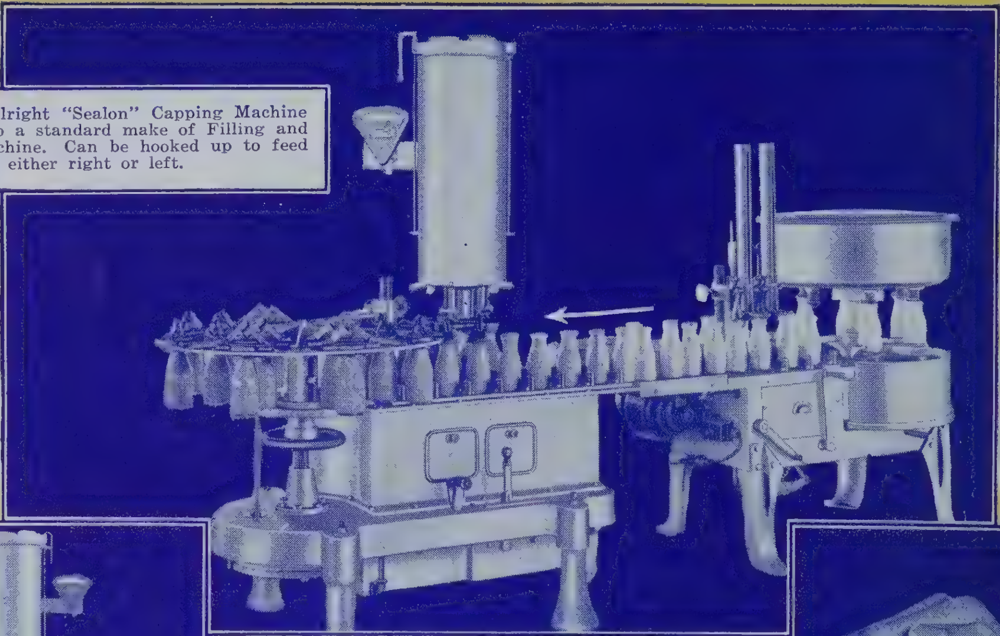
GRADE A PASTEURIZED
THE N.Y. STATE GUERNSEY BREEDERS ASS'N INC.

HERE you see the "Sealon" Hood Cap as it appears before application to the milk bottle by the "Sealon" Capping Machine. Its clear, cream-like color readily permits the finest type of cap printing. While the cap has a skirt long enough to cover and protect the entire top of the bottle, it is not so long as to detract from the view of the cream line. "Sealon" Hood Caps are delivered in easily-handled units of about 200 caps each, packed in dust-proof cases, ready for instant use. They are electrically sterilized at 280°F. at the moment of application to the bottle.

See the Sealright "Sealon" Capping Machine on back of this page

Showing Sealright "Sealon" Capping Machine hooked up to a standard make of Filling and Capping Machine. Can be hooked up to feed either right or left.



Efficient, Economical Simple

THE Sealright "Sealon" Capping Machine assures efficient, economical and constant operation because of its sturdy, simple construction and few moving parts. The "Sealon" capping process is as follows:

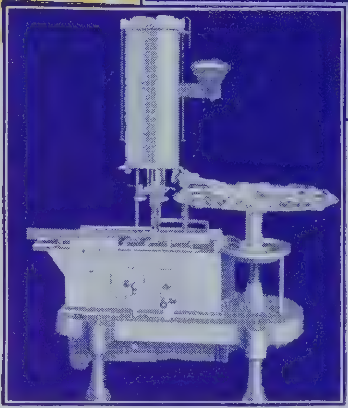
After the milk bottles are filled and capped with your usual Sealright disc caps on any one of the standard filling and capping machines, the bottles are automatically delivered to the Sealright "Sealon" Capping Machine.

This machine has two electrically heated chambers in which the "Sealon" Hood Caps are placed in preparation for applying to the bottles. Here they are heated to a temperature averaging 275° to 300° Fahrenheit.

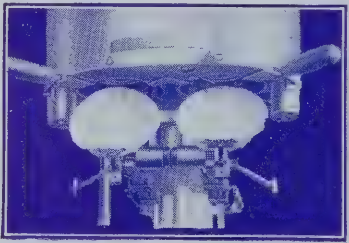
Then, without being touched by human hands, the "Sealon" Hood Caps are automatically delivered from the heated chambers perfectly sterilized, to the tops of the milk bottles, mechanically crimped, sealed and the finished bottles delivered to operator or taken up by packing room conveyor.

See our exhibit at the Dairy Exposition, October 24-29, inclusive (Booth 144), and you will appreciate why the "Sealon" is the most practical Hood Cap ever made.

SEALRIGHT CO., Inc.
FULTON, N. Y.

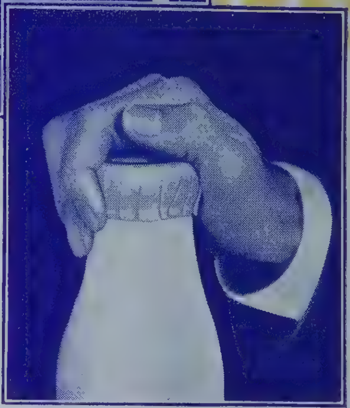


The Sealright "Sealon" Capping Machine is of simple construction, having few moving parts. Authorized "Sealon" jobbers render complete service and carry replacement parts in stock.



Here you see mechanical fingers automatically taking "Sealon" Hood Caps from the heated chambers in which they are prepared and sterilized before application to the bottles.

Above—shows "Sealon" Capping machine automatically placing "Sealon" Hood Caps on bottles, crimping, sealing and delivering to carrier system or operator.



The "Sealon" Hood Cap when crimped and sealed on is a permanent seal. Cannot be knocked off during delivery or removed without detection. Yet the consumer can easily remove it instantly.

Here the seal has been broken and the cap is being removed. The "Sealon" Hood Cap comes off clean, leaves no mark on the bottle.

The Sealright "Sealon" Capping Machine can be quickly and easily adjusted for capping quart, pint or half-pint bottles and for different speeds of operation.

SEALRIGHT SEALON CAPPING MACHINE

Sealright "Sealon" Hood Caps and Capping Machine fully protected by patents

How to Drive Away Milk Customers

Cutting Down Expenses in Delivery May Show Up in Losses That Will Astonish the Milk Plant Manager. Keep the Old Route Man on the Job

(By a Staff Correspondent.)

DOES it ever occur to milk plant managers that their customers are quite often more considerate and loyal to them than they are to their customers? This question is asked more from the standint of the customer on the outside looking in, rather an as a milkman on the inside looking out.

I refer particularly to the frequent and very often necessary changing of routemen and what it means the housewife as well as to the plant. And does it er occur to managers that their customers very often y their milk products from the routemen rather than om the firm they represent?

You are interested in holding all your customers on l your routes, primarily because each customer has definite dollars-and-cents value, but invariably a large mber of customers are lost because milkmen fail to ok at matters from the consumer's standpoint, and ry often plants curtail operating expenses to the point inefficiency in the wrong place, and that is in their elivery department. Why make routemen stand the lunt of salary cuts which result in frequent changes the detriment of your sales and profits, when the cut ight be made to better advantage and without injury mewhere else?

For instance, you think you have a good delivery ystem, particularly when it comes to employing and anaging your deliverymen. Invariably when you employ them you require a bond and agreement which tipulates that when the man decides to quit for any eason he shall "break in" the new man on his route efore he leaves the job, and if he is promoted or changed o another route you see to it that this is done, thus our customers on that route have a new milkman to leal with and to "educate" as to their individual ways f handling milk and other dairy products in their omes.

The old routeman, who has been very friendly and satisfactory to the customer who has taken considerable ains to break him in as to her deliveries and the way he wants them, makes a trip or two with the new man n the route and tries to show him the intimate details f taking his place, what each customer habitually takes very morning, whether a pint or quart of milk, a pint r half-pint of cream, a pound of butter extra on Thurslays, where the money or milk checks are to be left, whether the deliveries are to be placed on the front walk r put in the ice box on the back porch, and so forth.

Well, the probabilities are that the new routeman s not a mental giant and even with penciled memorandum he can't remember all these intimate details as to handling his route and he makes a lot of mistakes and provokes your customers all down the line for many trips or until he is thoroughly broken in by your suffering customers. Then you and your customers no more than get this new man familiar with his work until you make another change and the same agony has to be gone through again—he quits or is fired for some reason or another, and it quite often is a resignation as a result of insufficient remuneration to retain or sustain him. This frequently results in the loss of steady customers without gaining any new ones, for there is a limit to a customer's patience even though she likes your products and quite often she is more considerate and loyal to you than your consideration of her deserves, and what you intend for a curtailment of operating expense and increasing of profits, ends up in actual loss when she becomes disgusted and calls in a routeman of some competing company to serve her requirements.

The contented, well-paid routeman builds up acquaintance and trade on his route and your firm suffers a direct loss every time you change men on delivery routes.

I live in one of the suburban cities adjacent to Los Angeles. My wife patronized one of the big local milk plants steadily for six years and during the past year her endurance and patience has been something remarkable, not to mention my own, for this company changed our routeman on an average of once a month —not to mention the times they missed us—and we finally just had to quit the concern and give our business to another, for it was too big a task and too annoying to have to be dealing with and instructing new routemen all the time.

One routeman, a steady, reliable, middle-aged Swede, whom we liked very much, stayed on the job something like three months, but finally he was compelled to quit. On his last trip, when he was telling me about handing in his resignation, I asked him what seemed to be the matter that his folks were everlastingly changing their routemen, and, quick as a flash, he replied:

"They don't pay us anything, and their check-in and check-out rules are so unfair and unreasonable that we can't stay with the job only long enough to find out all this."

Of course, that is the summing up of his side of the story, but certainly there is something wrong, seriously wrong, with the milk company which changes its routemen every "turn around." It is so natural to become too engrossed in figuring down the overhead and centering all attention upon plant operation and things immediately surrounding us, without giving proper thought and first-person investigation by coming into direct contact with customers out on the different routes and getting first-hand information concerning the customer's viewpoint, because, after all, the customer's viewpoint is the vital part of your business.

* * *

U. OF W. DAIRY GRAD QUITS INSPECTION TO ESTABLISH HIS OWN DAIRY.

A. W. Schmidt, a graduate of the University of Wisconsin in the department of dairy husbandry, formerly engaged in inspection and promotion work for the state department of agriculture among dairymen in and around Americus, Ga., has decided to establish a dairy business of his own. He has purchased the Holly Springs Dairy, formerly operated there by W. R. Hansford.

Mr. Schmidt claims that Sumter county possesses unequalled advantages for the pursuit of dairying.

The Marvel of Milk

Its Munificence Has No Equal

[Reprinted from The Dairy Farmer by Special Permission]

The emotional re-action to the mid-morning lunch of milk!

OUT on the back porch at home, there is a four-by-four post on which you will find some peculiar marks, made by pencil or a ten-penny nail, with figures which you might recognize as abbreviated dates. Another set of these hieroglyphics may be found on the other side of the same post. It is the homely method that has been used for ages in many families for recording the gain in height of their boys and girls, from year to year.

When this frequent event of "measurin' up to see how much you've growed" had been tallied, there was always a direct increase in the family milk consumption. "If you want to be big and strong, drink your milk," we were urged. And the contest of that old four-by-four's records has spurred many a youngster to forego dessert until the large glass of milk had been drained to the last drop. The best part of it was that the milk was always at hand.

Today there are millions of just as worthy children, living in congested cities, who may yearn to "make their mark," just as we did, but who must face the increasing problem of living miles from a cow, or the restraining influence of a limited family food budget. Thousands of these children have never so much as seen a cow—and to them milk is just like the family dog—found each morning on their doorstep waiting to be taken in. Cities show frequently that from 20 to 40 per cent of their children fail to weigh what they should. However, this condition is not confined alone to cities. Surveys have been made in country areas which show that similar conditions prevail. Lack of proper foods, correct exercise, and other health requirements have stolen the normal start in life that should be theirs. And this is not confined to poor families, either. Many of the well-to-do parents are surprised to find that by allowing their boys and girls spending money, comfort, and a free reign over their personal habits, they have permitted sweets to replace solid-body-building foods, and luxury to rob them of exercise, sleep and other health-building needs for normally developing children.

The Bedtime Drink.

Science is constantly developing surprises and keeps reminding us of new and more marvelous qualities of milk.

Logically enough, milk should b Nature's most perfect food, since was created to entirely sustai young life and to furnish the bod nearly every requirement for growt and health.

Nutrition specialists tell us tha there are three considerations in th selection of food for our bodies. Th first is to secure an adequate amoun of the right kind of proteins. Ther seem to be complete and inadequat proteins, but to milk and eggs Na ture has bequeathed an endowmen of the nearest to complete protei values.

The second consideration is tha our food must contain the newly di covered substances which have fo many years been responsible for ou growth, development of our nervou systems, the creating of energy an resistance to disease, these su stances being known as vit mines. There are five vitamine now recognized by science being contained in foods, eac one of which seems to have ce tain mystifying characteristic which help to maintain th body functions and goo health. Whole milk contains a five of these vitamines, wit varying quantities of vitamin C.

Lickin' Good.

These vitamines are characterized name. The first to be discovered as vitamine B, the absence of which the cause of certain diseases. Vari- ıs investigators in studying the ıbits of many people came upon the ırprising fact that among rice ıters of the world—in Japan, China ıd other western countries—there ɩisted a disease known as beri-beri. ı studying the diet and the proper- es of foods of these nations, scien- sts found that certain foods had roperties which other foods did not nd thus established the new vita- ine B.

Further studies have found that ıck of vitamine A, or the fat-soluble itamine, caused people to become ıore susceptible to certain infec- ious diseases; and that this vitamine vas necessary not only for growth ut it is this vitamine which builds p resistance to diseases such as olds and other ailments of the hroat and lungs, not only for chil- ren, but adults as well. Then fol- owed the discovery of the existence f vitamine C, which must e present in our food to rotect us against the lisease known as scurvy. This vitamine is also lefinitely concerned in he proper growth of ones and teeth. Absence f the fourth vitamine,), causes rickets and ence the need for chil- lren especially to have n abundance of dairy products, since butterfat is one of the important food sources of this growth-promoting substance. Recent studies have developed that the fifth vitamine, E, is necessary for reproduction.

The third requirement, according to nutritionists, for proper food selection, is that our foods contain a certain amount of minerals, such as calcium, which is the most needed of minerals for the human diet. It is also important that the body secure some phosphorus and some iron to maintain the body structure. It should not surprise us, then, that nature has provided in milk the proper amounts of these minerals, in proper balance for body building; even the iron, while small in amount is of superior quality. For instance, we little realize in drinking a quart of milk that it contains as much calcium, or as we commonly call it, lime, as a tumbler filled with saturated lime water. With this knowledge we can understand why our teeth and bones become strong and hard and why lack of this element in the body causes rapid deterioration, even when we little realize it.

"The best study in our school is the milk lunch," says this happy lass at the mid-morning lunch period at Manchester school, Pittsburgh. The National Dairy Council is sponsoring milk lunches in every school in Pittsburgh, because it is bone and muscle building, and refreshening to the empty little tummies that make studying so tiresome Teachers encourage these lunches because it makes their pupils stronger and more alert students.

Milk is the Drink of Friendship.

These girls are twins. They were the same weight at birth, and have been raised alike except that the larger girl uses milk and now weighs 68 pounds, while the smaller one does not use milk and weighs but 58 pounds.

To emphasize this point, we turn to an interesting experiment described by Dr. H. C. Sherman of Columbia University, a world authority on nutrition. Dr. Sherman tells the very interesting story of a pigeon fed for a year on other foods than milk to such an extent that it was denied the proper amount of lime content. After a year of such careful feeding the pigeon was hopping about just as lively as ever, but can you imagine the surprise of the investigators in dissecting to find the stationary bones in the pigeon's body were perforated, where calcium for maintaining the body functions had been drawn from them.

For many years the scientists have been studying the effect of dairy products upon the habits of animals. Chiefly among these have been studied the diets of experimental rats, chickens, pigs and dogs. In every instance, lack of dairy products in some form in the diet of these animals has resulted in stilted growth and a gradual lowering of resistance to diseases to such an extent that if the elements in dairy products has not been supplied to these animals, they would have perished.

Having found the fundamental need of milk in the diet of animals, scientists were able to recognize and to better assist thousands of undernourished boys and girls in our cities to become strong and healthy once more.

What a general health program for city children can mean is emphasized in a study made among undernourished children throughout the country by the Elizabeth McCormick Memorial Fund of Chicago. A program of the "Children's Year" was instigated and carried through to completion. Six million children were weighed and measured, proving to the whole country that there are standards of growth and development to which a child should measure up and that underweight, malnutrition and physical handicaps were to be found among the children of the rich and well-to-do as well as among the poor.

Extensive experiments were conducted, taking undernourished children from Chicago homes, with the co-operation and consent of their parents. The results of these experiments have awakened health and welfare leaders to the big task before them. Thousands of children that were as much as thirty to forty per cent of the average weight for their height were brought up to normal health and vigor in a surprisingly short time. Where physical handicaps, especially adenoids and bad tonsils were retarding the children, medical service was provided to remove these defects and the children made quick response in health progress as a result.

Summer camps are maintained for undernourished children in most large cities nowadays. For instance, at Camp Happy, near Philadelphia, Pa., hundreds of children line up each day for milk lunch, as a part of the health program to build them back to strength and happiness.

America is not the only country awakened to the marvel of milk and the problem of seeing that future generations are given a strong heritage of good health in childhood. For some time in the industrial sections of Great Britain observations have noted that children were being underfed or improperly fed, resulting in a decreased efficiency, not only of factory workers, but of resistance to disease which became prevalent in the thickly populated factory areas.

To remedy this situation the Medical Research Council of England conducted an extensive experiment covering a period of four years, in which they selected 220 boys, typical of the industrial section, and housed them under average conditions, after having given them thorough medical examinations. Throughout the period of four years these boys were carefully observed under medical supervision. All secured a basic diet, some of the groups being given milk, some butter and some vegetable margarine in addition to their basic diets, while another group was maintained on the basic diet only, to secure a fair comparison.

Sixty-one boys were given a basic diet. This basic diet satisfied the appetite of these growing boys and apparently was all that was needed. During the first year these boys increased in height 1.84 inches and gained an average of 3.85 pounds.

Another group of boys, forty-one in number, and as nearly like the group of boys in the first group as possible, were fed a pint of milk a day in addition to the basic diet. As a result, their gain in height was 2.63 inches and their gain in weight 6.98 pounds. In other words, their increased gain in weight, because of milk, was 81 per cent over the basic gain.

The basic diet varied from day to day and consisted of selections from the following: potatoes, bread, bee pork, herring, kipper, sausage, dumplings, cabbag beets, beans, peas, porridge, "Hoosh" lettuce, molasse sugar, cheese, cocoa (containing a total of two to fou ounces of milk daily), margarine, jam, raisin suet pu ding, rice pudding and cake.

It is to be noted that no preference was shown i selecting the group of boys. They were as evenly ba anced as was possible to make them. The entire exper ment was planned and conducted under the supervisio of the Medical Research Council under the Privy Cour cil of England.

The differences in gains were the result of the foo and nothing else, inasmuch as the housing condition were the same for all the children, their activities wer the same, and the same factors prevailed in all cases, ex cept with respect to food.

Apart from the marked gain in weight and heigh which is shown by the boys who received the extra mil ration, there was also a general improvement in thei physical condition.

There was absence of illness during the winter o 1923, and 1924, among the boys with the milk ratio although in other houses in the village the sickness rat was somewhat higher than usual.

After eighteen months observation a casual visito entering the dining halls where the boys sat at tabl would never fail to recognize the table of that hous which was alone receiving the extra milk ration, th boys of that house being obviously more fit than thos of the other houses.

In another house where a group of boys had been re ceiving the basic diet with butter the gains were almos as noticeable as with milk. With our knowledge of th marvelous food values with which nature has endowe the butterfat in milk, we are not surprised when th English council reports that still another group fed th basic diet with an added amount of vegetable oi margarine gained no more in height than the boys re ceiving only a basic diet and but little more in weigh The butter fed group gained 20.9 per cent more i weight and 20.6 per cent more in height than the marga rine fed group.

Knowing that doctors and scientists have learne that margarine is inadequate in growth and health pro moting qualities, it seems quite unreasonable that w as parents should want our children to grow up withou the essential qualities of butterfat. As a matter of fact doctors everywhere find that while children may see to be growing while being fed margarine they are i fact growing much less than they would if allowed normal amount of milk and butter. In addition studie of resistance to disease have shown that the childre being fed on adequate amounts of the elements in but terfat are more resistant to disease and necessarily be come stronger women and men.

As we find it necessary to work from early mornin until late at night attending a herd of cows and milk ing, it seems, incessantly day after day with the objec tive of a monthly check, there is a satisfying feeling fo the dairyman to know that with each pail of milk he i sending to market there are a half dozen city youngster denied the pleasures of open country, who will be kep strong and healthy with his product. That is why peopl are willing to pay better prices for clean, safe milk an should account for the exceeding pains we go to now adays to make sure that thousands of city children shal find milk just as convenient and wholesome for the in a tenement as it would be were they on the farm.

This little Booklet

has saved thousands of dollars in interior painting

MANY plant managers are cynical about the claims made for interior paints. No wonder—in view of their costly experiences with paints that yellow—paints that flake—paints that get dirty and can't be washed!

It is difficult to prove in a short advertisement that any paint overcomes all these objections and yet actually *costs less* when applied.

But we believe that our booklet, shown above, contains facts and honest testimony of actual users, which do prove that Barreled Sunlight resists yellowing, will not flake, washes like tile, and can be applied at the lowest cost per square foot covered.

The manufacturers of Barreled Sunlight have been specialists in the industrial white paint business for over 20 years—long enough to know most of the problems and also long enough, if thousands of satisfied customers mean anything, to solve those problems pretty completely.

The coupon will bring you a copy of the booklet and a sample panel painted with Barreled Sunlight.

U. S. Gutta Percha Paint Co., 9 Dudley Street, Providence, R. I. Branches: New York—Chicago—San Francisco. Distributors in all principal cities.

Now we offer Outside Barreled Sunlight, and recommend it with the same assurance as we recommend Interior Barreled Sunlight. Write for information as applied to your own outside painting.

When to Fire a Milk Salesman

And When to Keep Him on the Job. A Lady Sales Manager Gives an Exclusive Interview to a Representative of The Milk Dealer

TO FIRE or not to fire! That is a question that confronts sales managers, not only of dairies, but of all industries. A sales manager of a dairy, however, has special problems of his own, such as getting men out at two or three in the morning, keeping down the turn-over, building up loyalty. All of these are difficult of solution in any dairy business. Grace Irene Roberts, sales manager of the Roberts Sanitary Dairy in Omaha, has taken time to tell The Milk Dealer how she handles these problems whenever they arise.

GRACE IRENE ROBERTS,
Sales Manager, Roberts Dairy,
Omaha, Nebr.

Miss Roberts — let it be explained in the beginning—has grown up with her job. She started out with the company when it was in its infancy, 18 years ago. She has full charge of the Omaha plant which now numbers over a hundred men.

One of the things which experience has taught her, she said, is not to fire a man always, even though circumstantial evidence may not be in his favor.

She told the story of a route foreman who came in to complain about one of his men. Although this driver had been with the company long enough to know better, he had given away six dollars worth of milk tickets without receiving either cash or credit slips for them. He had made a muddle of other tickets and his record was not clear. The foreman thought he ought to be fired.

Such behavior is serious; but Miss Roberts listened to the end of the complaint without committing herself. Then she called in the driver.

At first he was defiant. But he softened up when she told him that his past record was too good for her to believe that this past mix-up was typical of his way of handling his affairs. He explained some of the mistakes, how he had given away the six dollars worth of tickets to a woman who was having a party and was too busy to pay for them but who was good for the money. Still Miss Roberts was not satisfied; she knew something else was wrong.

Finally she told the driver that she had no intention of firing him because she believed that he was worth too much to the company. In return for such an unexpected tribute of confidence on her part he blurted out the whole story, the old, old one of losing milk tickets and being afraid to confess the loss, and trying to cover it up by devious little misrepresentations.

Then Miss Roberts had something to scold him fo Why hadn't he come in at once and told her about th loss of the tickets? She made him see that his attitud toward the company in hiding his loss was worse eve than the loss itself. She did not fire him; she taugh him a lesson in loyalty. After that he never repeate the mistake and his understanding of the spirit of th company made him a better worker than he had bee in the past.

It took patience and experience, she said, to lear how to get at the heart of the trouble when a man suddenly went wrong. It was harder than firing them But she had learned to balance a driver's record in th past with his present misbehavior and to decide th question on that basis. She believes strongly in th fundamental goodness of people.

"Firing men," said Miss Roberts, "is expensive. I costs us, we figure, about $100 in training, inconvenienc and delay to our customers to lose a man. We don' want to do it unless it is necessary. When we hire man, we begin at the very beginning to make him th best salesman possible. We have already analyzed ou situation and we know that our salesmen must be special type of men. We have put ourselves in the customer's place, asking what is demanded of a milk salesman and so we think we know just what we want.

"Our salesmen must be clean, must be good mixers and must have agreeable dispositions. They go out an meet all kinds of women, some of whom will be bad tempered. Throughout any interview the salesman mus remain cheerful. We keep that in mind when we selec them.

Dealing with housekeepers is harder than dealin with business men. Men are accustomed to meetin strangers and a courteous manner is often part of thei business. But the housewife doesn't care. Then, to women use their hearts more than their heads. The often purchase milk from a nice young man just because he is agreeable and has nice manners, withou regard to the kind of milk he sells. We furnish goo milk and good manners together."

Miss Roberts has hit upon a happy solution of making the men report on time. If they are late more tha one day a month they are docked a day from their vacation. It is seldom, she said, that the men are late. Several of them have worked for years without losing single day from vacations.

The turnover of the dairy for the year 1926 wa exceptionally small, considering the business. It wa only 67 per cent, including promotion of drivers to rout foremen and all changes made in the personnel.

One of the secrets of the small turnover is partl the loyalty that Roberts men feel for their company and the secret of the loyalty is due partly to the training the men receive in marketing their goods.

This salesmanship school is managed by Miss Roberts assisted by J. R. Roberts and other officials of the company. The men are called together for one hour a week meeting in the afternoon. The meetings are so interest ig that no special effort is needed to get the men to end. Milk products are also studied and analyzed; instance, the men are told how cottage cheese is de and some of its uses. Special demonstrations are t on to illustrate house to house selling. The em-asis is always laid on the fact that this type of selling not high pressure selling and that ability to hold cus-ners is just as important as the ability to make them.

The advantages of teaching men in this school how handle and display their products is illustrated by e following incident: One of the Roberts men was lling tickets on a Sunday morning when he was hailed an angry customer. She had bought a bottle of XX hipping cream which had turned to butter when she hipped it. A neighbor had been present at the butter-aking process and had told her that Roberts' cream ways behaved that way and that she should buy her eam from another dairy.

The driver followed the customer into her kitchen. here he found the Sunday dinner on the stove which as going full blast. The cream was standing on the ack of the stove. He at first said nothing but tried to elephone the dairy to have some more sent out; no one as in on Sunday morning so he had to bring in a bottle f cream from his own wagon. He told the customer at he would whip it for her and show her how well it hipped under the proper conditions.

It so happened that this man never had in his life hipped cream. All he knew about it was what he had earned at the salesmanship school; but there he had een told that it must be properly chilled. So he fol-owed directions as he remembered them. While the ream was in the refrigerator he explained to the two omen the necessity of a thorough chilling. Then he ook out the cream and whipped it in a few minutes.

By that very simple act he not only kept his cus-omer but made a new one of the neighbor. His ad-antage lay in knowing just what to do, and the train-ng in the school was responsible.

Each driver in the Roberts Dairy is under a route oreman who supervises a group of seven men each. hese foremen take great interest in the sales meetings nd encourage their men to attend.

One of the inflexible rules of the dairy is to always select men for the higher-up positions from those lower down. The driver who makes good, therefore, knows that he has a chance to become route formeman some day.

Miss Roberts makes a point of complimenting the foremen on any good work she hears of their drivers doing. The men, she has learned, would rather have the foremen hear their praises sung than listen to such sweet music themselves.

She enjoys having a chance, however, to tell the men how good they are. In fact she wishes, she said, that she had more time to tell them everything nice she hears. All sorts of letters and phone calls come to her from grateful customers who appreciate the service some driver has rendered. She also receives letters from people passing through Omaha who thank her for such courtesies as rushing a bottle of certified milk to the railway station so a hungry baby could have a meal between trains. These letters she keeps to show the special delivery men who deliver the milk.

When Miss Roberts first stated to work for the Roberts Sanitary Dairy Co. (by the way, even though the names are the same there is no relationship between her and J. R. Roberts) she had only a few months' training in a business school. The dairy was then so small that she kept books, wrote the letters, waited on most of the customers, and answered the telephone when J. R. Roberts was out. Today the Roberts Dairy is not only the largest in the state but in the Middle West and has plants at Lincoln, Sioux City, Ia., and Omaha. The Omaha plant is the largest of the three.

To Miss Roberts, along with two or three other employees who started out early in the game with him, Mr. Roberts gives much of the credit for the successful growth of the business. People often embarrass Miss Roberts by complimenting her on holding so successfully a job that no other woman in a large dairy has ever held; but her embarrassment soon disappears in her enthusiasm for her work.

Her only source of regret about her position, she said, is that the days are not longer. There is not time for her to do all she wants to for "her boys."

JAPAN'S MILK PRODUCTION INCREASES.

Milk is being used more and more in Japan, accord-ng to Assistant Trade Commissioner DeForest A. Spen-er in a report to the department of commerce, Washing-on, D. C. To the foreigner it appears remarkable that nation with such a high birth rate as Japan would con-ume so little milk. In fact, until about 30 years ago nilk was used by infants only as a last resort. Adults ever touched milk in any form.

Since the invasion of foreigners into the country, owever, milk made its appearance in the form of con-lensed and powdered milk and other forms of milk fats. The following table shows the increase in milk produc-ion in Japan in the last five years:

1922	25,734,072 gallons	
1923	28,790,256 gallons	
1924	30,626,920 gallons	
1925	33,250,815 gallons	
1926	35,778,536 gallons	(Estimated)

WILLOW STREET DAIRY FURNISHES PUREST OF PRODUCTS TO CUSTOMERS.

The Willow Street Dairy, located at Willow and Alameda Sts., San Dimas, Cal., is one of the most prominent in that part of the state. Its place is modern and up-to-date in every particular, clean and sanitary throughout.

At this dairy every precaution is taken to produce the most pure and wholesome dairy products under the most sanitary conditions made possible through the use of machinery and up-to-date methods. All refrigerating devices are here installed for keeping the products in the best condition.

Mrs. Meyers has been actively interested in the Willow Street Dairy for 38 years and Miss Kirsch, who has been well schooled in all phases of refrigeration and sanitation, has for three years supervised the entire dairy. A great deal of the success of the dairy is due to the untiring efforts of both these women.

How Some Milk Dealers Get Business

How They Cash in on Their Present Customers Through Testimonials, Getting the Names and Addresses of Friends, Etc. A Dollar for Each New Customer

By FRANK H. WILLIAMS

SOME milk dealers are very particularly successful in cashing in on their present customers in the very important matter of securing more customers and it will, no doubt, be interesting and worth while to various other dealers to consider some of the methods employed in doing this.

Inspection of the methods used in this matter by various enterprising dealers reveals the fact that these methods may, for the most part, be divided into the following plans:

First—Securing testimonials from present customers and using these testimonials in the customers' neigborhoods for the purpose of inducing other people to patronize the concern.

Second—Securing from the customers the names and addresses of their friends and relatives and then soliciting these friends and relatives for their milk business.

Some concerns find that the first plan yields the best results while others find that the second plan is best for their purposes and a third group of milk dealers find that a combination of the two plans brings in the most business.

Let us look at some of the things said by enterprising milk dealers regarding their own particular methods of cashing in on present customers to the fullest possible extent.

"We try to make it a point," said the head of a successful Western milk concern, "to try and make each one of our customers help us in getting more customers at least once during the course of a year.

"At least once each year we will ask each of our customers for the names of friends and relatives who might be interested in securing milk from us. Then, of course, we solicit the people whose names are secured in this way and try to get business from them.

"Of course, it is quite likely that the customers who give us the names of prospects will give us names of people who are already our customers. So we always check up such lists of prospects before giving them to a salesman to use in solicitation. This saves the salesman a lot of lost effort.

"This method of cashing in on our customers in an effort to get more business has proved very helpful indeed to us and I expect that many other milk companies might use the same sort of a plan with equally good results."

The proposition of using an introduction card in soliciting business was emphasized by another dealer in these words:

"You know there is a big hosiery manufacturing concern which sells direct to the consumer which uses an introduction card with great success. Every time a salesman for this concern makes a sale he asks his customer for the names anl addresses of friends or relatives who might also be interested in buying hosiery from the concern. Then when the customer gives the salesman such names the salesman gets the customer to fill out what are called introduction cards. On each of these cards there is a space at the top of the card for the name of the prospect suggested by the customer. The customer writes in the name of the prospect in this space and signs his own name in the space provided for the purpose at the bottom of the card. The card then reads something like this:

" 'Dear Mrs. Jones:

" 'I am sure you will be interested in learning about the Whozis hosiery which I wear and whose merits wil be presented to you by a salesman for the concern.

" 'Yours truly,
" 'MARY BROWN.'

"The salesman then takes these cards with him when calling on the prospect and presents the right card to each prospect. This gives him a splendid introduction to the prospects and makes it just that much easier for him to put sales across.

"Here in this company we have adopted the same plan in cashing in on our present customers. We get our customers to fill in and sign introduction cards of this sort to their friends and relatives and the salesmen then use these cards in calling on the prospects and in this way get splendid introductions and secure a lot of business that they would probably never secure otherwise."

And there's no doubt but what there are numerous other milk concerns which could use this same idea with equally good results.

An interesting method of cashing in on customers testimonials was told about by another enterprising milkman in these words:

"We are strong believers in the efficacy of testimonials in building more business. But we also strongly believe that all testimonials should be just as fresh as possible and should be dated so that the folks to whom they are presented can see that they are new and apply to our company as it is constituted at the present time.

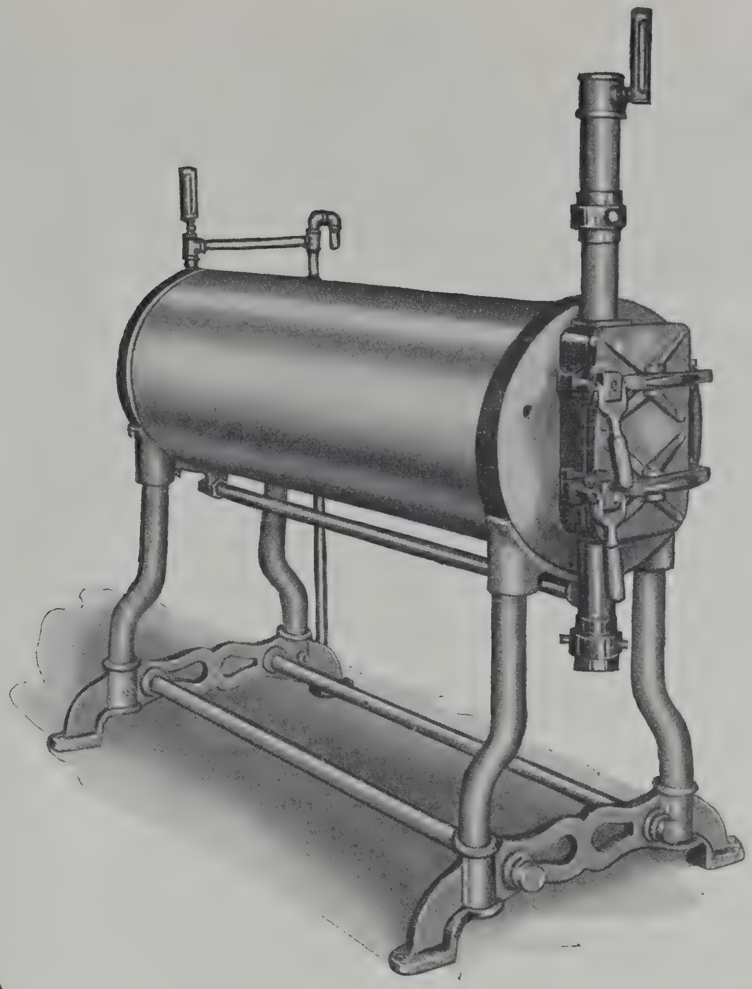
"We ask our drivers to always ask customers, when selling tickets or any other opportunity presents itself how they like our milk and our service. Then the driver makes notes of particularly complimentary things said by the customers and tell them that the things they've said about us are going to be used by us as testimonials We feel that it is good business for us to take the customers into our confidence in this way as this safeguard us against making any customers sore through quoting them without asking their permission.

"If the customers are particularly enthusiastic about our products, service, etc., the drivers ask the customers to write out a little testimonial for us in their own handwriting on their own stationery. We find this sort of a request makes quite a hit with some of the customers as it flatters them to think that we consider them so important. So they generally do as requested without any demurring.

"Then we paste such testimonials on sheets of paper in a loose leaf book which is used by our salesmen in going around and soliciting business.

"With the notes made by our drivers about the flattering things said by the customers we typewrite several of these testimonials on a single sheet and incorporate this sheet, too, in the testimonial book.

"We keep eliminating old testimonials and substituting new ones for the old ones in this book all the time And I am confident that our use of customers' testi



The CHESTER BARRELETTE

A modified Chester Barrel Heater used principally for low duty preheating before separators, clarifiers and filters.

The same principles embodied in the manufacture of the Chester Barrel Heater are incorporated in the Chester Barrelette, but with certain modifications which greatly increase its operating capactity without increasing back pressure.

Two Sizes: Respectively 6,500 and 10,000 pounds per hour.

Complete Literature Will Be Sent Upon Request.

DAIRY AND ICE CREAM MACHINERY AND SUPPLIES ASSOCIATION, INC.

monials in this way is one of our best helps in securing new business."

An interesting and rather unusual method of cashing in on customers is used by another milk concern, whose manager told about the method in this way:

"We will give a dollar for any customer who secures another customer for us. If, for instance, we have a customer who has good neighbors on either side that aren't taking milk from us, we'll go to the customer and tell her we'll give her a couple of dollars if she'll talk up our milk to her two neighbors and get their business for us, or we'll give her a dollar if she induces only one of the neighbors to take milk from us.

"This method has been splendidly successful with us in getting a lot of new business for us and, of course, a dollar isn't too much for us to pay for a new customer."

All of which is presented in the hope that it will offer worth while ideas and suggestions to other milk dealers which they can use to good advantage in their own businesses.

Advertising That Tells People of Milk

The Windsor Farm Dairy of Denver, Colo., during the past several weeks, has been running some very good advertisements in its local newspapers telling people of Denver about milk. These ads are three columns wide and about ten inches deep. They are illustrated with line drawings and the reading matter is in large type with plenty of white space to cause the ads to stand out prominently on the page. Each ad in the series is different and consists of a very interesting as well as instructive message.

A recent ad in the series was entitled, "Milk is a Man's Drink." The ad further stated: "Workers in the shipyards during the war proved that real, hard-hitting, two-fisted he-men can do better work if they drink lots of milk. And the personal experience of thousands of other men has emphasized that fact.

"Try it. Top off a very light lunch with a glass of Windsor milk. Chase that mid-afternoon drowsiness with a glass of Windsor milk. And drink a glass of hot milk at bed time. You'll sleep better—feel better—be better.

"Don't let the kids and invalids monopolize this wonder food that Nature made for everyone—pure, clean, wholesome."

Another ad read:

"Windsor Milk—Measured by Quality, Instead of by Quarts.

"The Windsor label stands for a unit of measure—measure of quality as well as of quantity!

"A quart is a measure of quantity only—so, in order to provide the dairy farmer an incentive to produce milk of higher and higher quality, the Windsor Farm Dairy pays the producing dairies on the basis of tested richness and food value of the milk. A premium is placed on richer milk—milk of greater food value.

"Thus it pays the Windsor dairyman to constantly improve his herds—to keep only the finest milk cows—to insure cleanliness with the most modern equipment and methods of sanitation—to protect his investment by constantly improving the quality of his milk."

It will be noted that the advertisements of the Windsor Farm Dairy are all broken up into short paragraphs. This makes the ads more easy to read.

Another ad told of the value of milk for growing children. It said:

"Milk, the Children's Staff of Life!

"The springtime of youth demands food of the highest quality—a food that builds muscle and stimulates youngsters to their natural activity.

"In Windsor Milk you will find all the necessary proteins and butterfats that children need. The richness never varies.

"A trial of a single week will prove most convincing. Let our driver include your home in his regular call."

All the time the Windsor Farm Dairy is calling the attention to the value of milk as a food it is also stressing the fact that quality milk should be used. It is pointed out that, as in everything else, it pays to buy the best. An ad speaking of purity read as follows:

"Direct to Your Table Windsor Milk. Containing all the healthful properties of the fresh, full milk, as Nature intended.

"Pasteurized to insure its purity.

"Delivered in the early morning by healthy men who know their business. On your doorstep in sanitary containers.

"Uniform High Quality!

"A trial will convince you of the truth of these facts, for it has won much favor through its flavor!"

Some of the Windsor advertisements are made up of very little reading matter with the drawing used putting over the message in a telling manner. Not long ago the major portion of an ad of the firm consisted of a line drawing showing a family enjoying a meal with milk playing the leading role. "There's Health in Every Drop," appeared across the top of the drawing in large letters. The remainder of the reading matter said:

"The 'Regular' at Every Meal. Windsor Milk. Baby's Health Demands Pure Milk. You, Too, Need This, the Best of Nature's Foods. Drink a Pint Each Day—See Your Worries Melt Away. Be Sure It's Windsor."

The Windsor Farm Dairy ads are appearing regularly in the Denver newspapers and are a very good example of what may be done, not only in telling people of the value of milk as a food, but also in spreading the message of pure quality milk.

⁂

NEW DAIRY HOME AT ST. LOUIS WILL BE A HOME FOR EXHIBITIONS.

St. Louis, Mo., will soon have a permanent dairy home which will be located in the south central portion of Forest Park. Representatives of the city, chamber of commerce and the National Dairy Show Association are now considering the dairymen's proposal to build a $500,000 structure in the park.

The show, which is held each fall, would require use of the building for less than one-half of the year, and it is promised that for at least 30 weeks of every year the building, with 400,000 square feet of floor space, would be turned over to the city for use as an indoor civic center and for exhibitions and celebrations. Authorization for use of the park space must be given by an ordinance, to be passed by the board of aldermen and approved by the mayor.

What the Courts Say:

By LEO T. PARKER. *Attorney at Law, Cincinnati, Ohio*

Facts That the Milk Dealer Should Know

Parker's Important Higher Court Decisions Report

IT IS true, indeed, that each month sees the settlement of new points of the law, as well as important variations of the established phases of the law.

Dairy Company Held to Be Common Carrier.

The recent decision of the Court of Appeals of Maryland in the case of West vs. Western Maryland Dairy, 135 Atl. 136, contains important information for various firms, particularly dairy companies which operate motor trucks.

The facts of the case are that the Western Maryland Dairy, Incorporated, was incorporated on the 31st day of March, 1914, under the laws of the state of Maryland, with its principal office located in the city of Baltimore. The company, pursuant to the authority conferred upon it by its charter, entered actively in the business of buying, pasteurizing, bottling, distributing, and dealing in milk and its products. In the conduct of its business it purchased its milk supply in Maryland and nearby states. Some of it was transported by rail and delivered to the company at the railway terminals in the city of Baltimore. Some was transported by motor vehicles, operated by individuals and companies on regular scheduled routes and delivered to the company at its plant in that city, while some was carried in the vehicles of the producers and delivered to the company at its plant.

These methods or means of transportation and delivery of the milk continued until the early part of the year 1925, when the Western Maryland Dairy determined to transport the milk by means of its own motor trucks. It bought out a number of individuals and companies, who were, at the time, transporting milk upon regular scheduled routes, and thereafter it carried the milk on those routes to its plant in its own trucks.

The record discloses that the milk consumed by the Western Maryland Dairy amounts to about 10,000,000 gallons per annum, and is one-half of all the milk used in the city of Baltimore. The farmers who produced the milk are members of an association known as the Maryland State Dairymen Association, and, with the exception of the milk consumed at their homes, the whole of their production is consigned to the association for sale, and is sold by it to dealers in milk, including the Western Maryland Dairy. In the sale of the milk, the association makes the arrangements and sells it to the dealers including the Western Maryland Dairy. In the sale of the milk, the association determines the price, as well as the terms upon which it is sold. The cost of transportation is borne by the shippers or producers of the milk, which ranges from 1½ to 4 cents per gallon, depending upon the length of the haul and the available transportation facilities from the point of shipment.

At least 76 per cent of the milk received by the Western Maryland Dairy is now carried to its factory in its own trucks operated on regular routes where the trucks call and get the milk of the producer from the same place at the same hour upon each of the scheduled days, but some of the milk consumed is still transported by railroads and by individuals and companies operating their trucks over regular scheduled routes. The amount bought is not ascertained and determined until it reaches the dairy plant, when it is inspected and weighed. If upon inspection it is found that the milk does not conform to the regulation of the Baltimore City Health Department, or if it is not acceptable to the dairy company, it is rejected and returned to the producer When the milk is carried by the dairy company in its own trucks to its plant, the quantity of milk is there ascertained. In its settlement with the producer for the milk bought of him the cost for transportation is deducted from the price of the milk at the plant.

The charge for transportation or "differential" as termed by the company, is fixed and established by dividing the route into zones and increasing the charge with the increased distance of the zone from the company's plant. When any part of the milk carried by the dairy company is known to have been lost or spilt in transportation, such part is accounted for to the producer.

In view of these facts the Public Service Commission sought to compel the Western Maryland Dairy to obtain a permit and license to operate its motor trucks **as a common carrier.**

As is well known the liability and financial risks of a common carrier are considerably greater than that of a private carrier. In other words, when operating its motor trucks as a common carrier the dairy company is liable **as an insurer** against all loss or damage of the product being hauled. Whereas a private carrier is liable for loss or damage to merchandise where the injury results through its failure to exercise ordinary care. Moreover, there are many other important reasons why it is more desirable and profitable for a dairy company to operate its trucks as a private carrier.

Therefore, the Western Maryland Dairy refused to obtain a common carrier license and permit from the Public Service Commission to operate its trucks, and filed suit asking the court to restrain the commission from causing the arrest of its truck chauffeurs, or otherwise interfering with the conduction of its business as a private carrier.

The lower court held the dairy company to be a private carrier, but the higher court reversed this decision and held the company legally a common carrier subject to the liabilities, rules and regulations governing all other common carriers.

This court rendered a lengthy opinion which, in part is as follows:

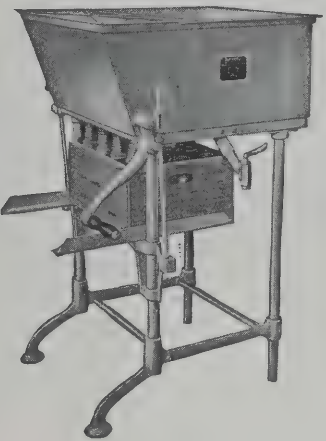
"It is difficult to determine with exactness just when the owner of a motor vehicle is operating as a common carrier, as that term is ordinarily understood in the law, but the courts have not been inclined to excuse the increasing numbers of those who earn their livelihood by transporting persons or goods for hire in motor vehicles from the responsibilities of common carriers simply on technical grounds, and they have been particularly slow to excuse them when their plan of operation bore evidence of being a studied attempt to reap the rewards of common carriers without incurring the corresponding liabilities.....It is, in fact, conceded by the appellee (Western Maryland Dairy) that with the

Are Your Bottle Fillers Always Ready and Efficient?

Single valve hand filler

DAIRY AND ICE CREAM MACHINERY AND SUPPLIES ASSOCIATION, INC.
ASSOCIATE MEMBER NATIONAL ASSOCIATION OF ICE CREAM MANUFACTURERS

BESTOV BOTTLE FILLERS



4 valve filler, single end

n a range of sizes that will completely take care of the needs of he average milk dealer.

Bestov crate fillers are regularly made in 4, 9, and 17 valve izes. Then there is the single valve hand filler which is a great convenience for bottling cream, nursery milk, butter-milk, and for emergencies.

Only the best materials are used to build Bestov Bottle Fillers. Tanks are made of heavy copper, thickly tinned. Frames are substantially constructed of galvanized castings, enameled on all surfaces. Bestov Filler Valves never leak. Each valve is factory tested with fifty pounds pressure. The valves and valve seats are ground in. They fill the bottles perfectly, with no drip.

9 valve filler, double end

Such features make Bestov Bottle Fillers a source of great satisfaction to owners everywhere. They are an ideal investment for the milk dealer who does not want to go to the expense of power fillers.

Why not let us send you a complete bulletin describing thoroughly the many advantages of Bestov Bottle Fillers.

exception of the milk transported in its own trucks, the place of delivery was in Baltimore city and not elsewhere, and it is only as to the milk it carries in its own trucks that the claim is made that the milk is delivered 'f. o. b. place of origin',.....Under these and other facts mentioned, the conclusion cannot be properly reached that the milk when carried by the appellee (Western Maryland Dairy) was by the agreement of sale delivered to it 'f. o. b. place of origin'.....If the ownership of the milk was in the producer while in transportation, which we think it was, we cannot conceive upon what principle it could be held that the appellee in the operation of its trucks, in the manner stated, is not subject to the supervision of the Public Service Commission of Maryland.''

Therefore, the important point of the law involved in this case is that the Western Maryland Dairy purchased the milk f. o. b. the producers' farms, and in so doing it actually was hauling the milk, not for itself, but for the producers.

However, it is very doubtful that by changing the arrangements and purchasing the milk f. o. b. the dairy, it can avoid obtaining a license to operate as a common carrier, because the court anticipated this revision of their policy and said:

''In holding that the ownership in milk was in the producer we are not to be understood as holding that upon all the facts of this case the company would be exempt from the provision of said act if it was found that the title to the milk was at that time in the company.''

In the case of De Charette's Guardian vs. Bank of Shelbyville, 291 S. W. 1054, it was held that a cream separator is personal property to the extent that it does not legally become permanently attached to the rea property in which it is installed.

The facts of the case are that a cream separator manufacturer sold a separator to the owner of real property The separator was bolted to the floor. Later the purchaser became involved in legal difficulties and the manufacturer, not having received payment for the separator, desired to remove it from the building.

The owner of the building contended that the separator had been affixed to the real property and, therefore, was a part of it, for which reason the manufacture was not legally entitled to remove it.

However, the court in holding a cream separato personal property and removable from the building b its unpaid owner, explained the law on the subject a follows:

''The cream separator was bolted down with three eighths inch bolts, and, too, was easily removable without damage to the premises. In determining whethe fixtures are in law immovable or not, there are, as th parties to this appeal agree, three general tests; first annexation to the realty, either actual or constructive Secondly, adaptation or application to the use or purpose to which that part of the realty to which it is connected is appropriated. Thirdly, intention to make th article a permanent accession to the freehold.....It i public policy to permit the tenant for years or for lif to make the most profitable and comfortable use of th premises demised than can be obtained consistently wit the rights of the owner of the freehold....The millin plant and the cream separator were brought onto th place in connection with the dairy business which Mrs Henning was operating.''

Westerners Planning for Biggest Show Ever Staged

The staff which will handle the seventh annual Pacific Slope Dairy Show is rapidly being organized to stage the great dairy exposition in the Municipal Auditorium in Oakland, Calif., November 14 to 19 inclusive. Plans for the show were formulated at a meeting of the executive committee recently. Those in attendance were Sam H. Greene, Oakland; C. O. Hagen, Los Angeles; C. E. Gray, Berkeley; J. J. O'Neil, Oakland; Geo. W. Prising, Oakland; E. A. Greene, San Francisco, and Robert E. Jones, Oakland.

Superintendent of Dairy Products G. D. Turnbow announced the judges for the dairy products division as follows:

Milk—S. J. Pearce, Salt Lake City, Utah; H. E. Ball, Berkeley, Calif.; C. E. Tegner, Santa Monica, Calif.

Butter—G. H. Benkendorf, Modesto, Calif.; F. H. McCampbell, Sacramento, Calif.

Cheese—H. R. Lochry, Salt Lake City, Utah; O. A. Ghiggoile, Los Angeles, Calif.; C. A. Phillips, Davis, Calif.

Ice Cream—C. A. Phillips, Davis, Calif.; S. J. Pearce, Salt Lake City, Utah.

The live stock show will be under the general supervision of a special committee composed of R. A. Condee, Sam H. Greene, G. E. Gordon, W. M. Regan, with Superintendent Arthur Folger of Davis in active charge.

The premium offerings for dairy cattle total approximately $7,000. It is expected that the livestock committee will shortly announce the appointment of judges for dairy cattle.

More interest than ever before has been evidenced i the machinery exhibit due to the fact that the Pacifi dairy show's machinery exhibits in the past have bee second only to those of the National Dairy Expositio The following named organizations have already contracted for space this year:

Pfaudler Sales Co., San Francisco; Kemper-Thoma Co., Cincinnati, O.; Individual Drinking Cup Co., Easto Pa.; Dominion Chemical Co., Chicago, Ill.; Chr. Hansen Laboratory, Inc., Little Falls, N. Lad Contrasts Size with Service.

"Here, Lad—

Your welded steel motor may be all right but I prefer to deal with heavily-manned organizations.

A big organization always does things in a big way."

"Yes, Pop—

but how big is big? When departments of a business get to be numbers on a sales chart — when the buildings of a business get to be like divisions on a real estate map — that's big all right — but it's far from personal — far from intimate with your little problems.

Now, while the "Linc-Weld" people are far from big compared with makers of EVERYTHING electrical — yet they ARE bigger than the biggest fellow when you take them on as motor specialists.

The bigness of any service consists in the amount YOU get out of it.

The "Linc-Weld" people make a motor in which you specify the results you want — rather than just another motor off the shelf.

And remember, Pop, that it isn't the size of a dog in a fight—but the size of the fight in the dog that counts."

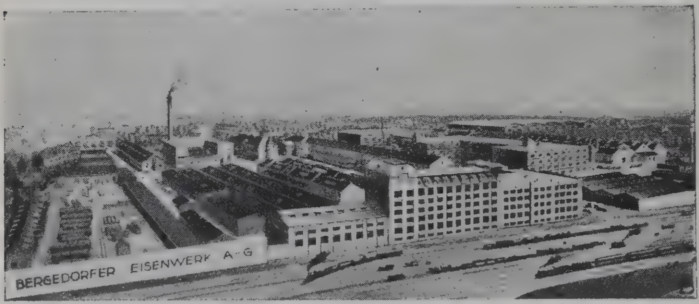
WAITING TO SHOW DELEGATES A GOOD TIME.

Hamburg, Germany, July 26, 1927.

Editor, Butter, Cheese & Egg Journal:

As I have had the pleasure to read the Butter, Cheese & Egg Journal for several years, it was not only by a mere chance that my eyes fell on your lines in the June issue regarding the World's Dairy Congress Tour.

You may take my assurance that it will be a sincere pleasure to us here in Europe interested in the dairy industry to be honored with the visit of our American colleagues. It is perhaps at the same time that human feeling of satisfaction when one thinks to have something worth showing and we hope you will have no reason to repent the time you sacrificed in crossing the sea.



Europe's Largest Dairy Machinery Plant.

The other day I encountered the manager of the biggest dairy machine factory on the continent, Mr. Prollius of the Bergedorfer Eisenwerk, the Astraworks, who received his engineering training in the States some thirty years ago after his university time in Europe. He told me that two years ago he had left for America for a business trip all around the States and his stay over there had really been a very happy time from all points of view. He only hoped that there would come a time when he might get the chance of returning all friendly kindness shown to him over in your country. As I am sure, there are several of his friends among your readers, they certainly will take the opportunity to call on him at Bergedorf, when they are passing Germany. It is a small picturesque town just a quarter of an hour from Hamburg.

The works are supposed to be the model of a modern European factory and, seen from the point that no other machines than those belonging to the dairy line are manufactured, the factory may be looked at as rather important even measured by American standards.

The work-shop floor space is about 80,000 sq. ft. and more than 2,000 employees are busy all the day turning out about 15 to 20 tons of first-class Astra machines each day. It is no wonder that nearly all dairies of any importance, be it butter and cheese factories or city milk plants, are installed by the Astra people. They will take pleasure in taking you to see the biggest combined churn and butter worker in the world, which has a total content of 2,800 gallons and turns out more than two tons of butter in one operation. Moreover, the biggest town dairies in Europe will be open for you and I am sure everybody will be proud to show you his own working field.

Yours very truly,
HANS E. MOTT,
Civil Engineer.

⁂

Success lies in doing little things well. "Milk Dealer" Want Ads are little things, but they carry big messages. Read them regularly.

MILK VERSUS CARBONATED BEVERAGES.

We are told that there is no danger from competition within our industry, but there is danger from competitive industries from without. The milk industry is going to feel forcibly the impetus of business that the carbonated beverage people are going to do. Health authorities are doing a wonderful work in promoting the use of milk as a food, but they cannot do it all alone and it sometimes looks like they have been deserted in the effort by the very people who should give them the most loyal support.

Carbonated beverages should never take the place of milk, yet each year we find the sale of these going over with a greater volume. Just take a casual glance at some of the advertising that is now being blazed before the public. It evidently pays to use publicity. If it were just the adult population that would indulge, it would not be such a serious matter, but every child in the country is drinking more of these beverages each year. No matter how small the town, you will find the little fellow on the corner with his so-called "pop stand." A child has a "saturation" point and when he is filled with carbonated beverage he is not going t drink his required amout of milk with any relish.

What would it mean to the dairy industries if al bottled beverages were a form of milk and why not Cannot someone in the industry make a wholesome healthful drink that will have a "competitive kick" and still be a milk product? If milk is really made t come first, it may require some touching up, to put i over with competitive products.

The dairy industry should not sit idly by and watc the American farmer feed his milk products to growing stock, while the children of our country are tryin to grow up on carbonated drinks.

You can't "tell" a child that milk is good for hi to drink. You must "make" it good for him. No chil eats ice cream because it is healthful, but because it i appetizing. Milk can be made just as attractive, with out affecting the ice cream business, but seriously affecting carbonated beverage business.

Chase Away Those Butter Substitutes.

The butter industry too must awaken to the fact tha substitutes are readily taking their place on the Amer can table. This condition should not exist—for th foundation of the nation's health is built on dair products.

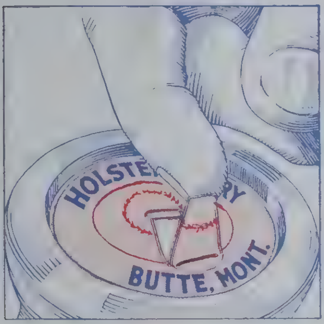
Many housewives are mixing one pound of butte and two pounds of substitute and are elated over th fact that the family cannot detect the deed. The dair industry cannot afford to let conditions of this kind co tinue. Butter contains certain vitamines that are esse tial to good health. Especially is this true of children- the butter gives them a better resistance to disease. Th wise mother does not become impatient when her chil insists on a liberal amount on his bread. She gladl spreads it on, content in the knowledge that the groce will get the money instead of the doctor.

In the long run, who will profit by false economy food products? The medical profession to be sure. is a much better practice to pay for wholesome butte and let the family use it extensively, happy in th knowledge that they are getting the necessary vitamine

Butter men must get people to thinking about th value of butter or these substitutes will affect the i dustry.

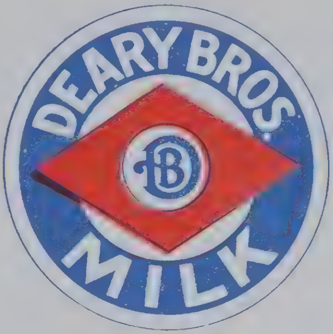
Ignorance of food values has brought about th condition and it will require educating the consumer to its value. as the only method of correcting condition

SEALRIGHT Meets Your Every Bottle Cap Need



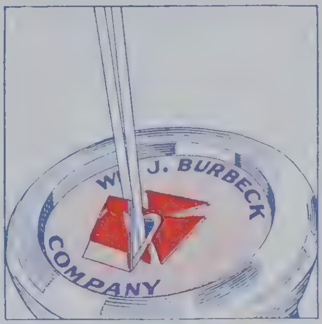
The Sealright Liftright Cap

THE NEW, exclusive patented groove makes it easy as ABC to lift tab and remove cap in a jiffy. No spilling—no mess—no opener to misplace. Has same clean-cut edges as all Sealright Caps.



The Sealright Regular Standard Cap

THE BEST and biggest selling "regular standard" cap in the world. Like all Sealright Caps, made from celebrated Fulton Board. Never gets "soggy" or "leathery" and always looks neat and attractive.



The Sealright Pouring - Pull Cap

HAS THE same patented groove as the new Liftright Cap. There is an opening in the Cap for inserting straw or pouring without removing cap from the bottle. Ideal for use in home, school and restaurant.

Now Three Famous Caps under One Famous Name

WITH the new, patented Liftright Cap added to the Sealright Family, there is now a Sealright Cap for every bottle cap need. Whatever type of cap you prefer, you can now use a Sealright and secure the full benefits of the big national advertising campaign behind Sealright Caps. Remember that Sealright advertising, year-in year-out, urges the use of more milk as well as the popular advantages of Sealright Caps. That's why it pays to use Sealrights. Write today for Free Samples of the three greatest caps in the dairy industry.

FROM top to bottom every Berney-Bond-Winslow milk bottle displays care and skill in manufacture—represents the final achievement in bottle making.

These crystal clear bottles display milk as it should be—appetizing, rich and creamy—not weak, watery blue. The attractive, graceful designs make a pleasing package—tireless salesmen working for your interests.

We go beyond ordinary care and test our bottle moulds at least four times daily to assure that every bottle is up to Berney-Bond-Winslow specifications. You and your customers are protected against long or short measure when your bottles bear the Berney-Bond-Winslow mark.

Built to Stand Knocks and Reduce Replacement Costs

Reduce replacement costs with Berney-Bond-Winslow bottles. They are built to stand even more than the ordinary knocks that every milk bottle gets. Heavy, well formed heads obviate chipping—evenly formed glass at shoulder protects against impact—arch-like thickening at base absorbs heavy blows without damage. Every bottle is scientifically annealed and continuous testing makes the bottle bearing this famous brand the ultimate perfection in bottle making.

Ask for a stock bottle for your inspection. Note its perfect finish, snug cap fit, sturdy appearance. Test it in every way you desire then write us for quotations on your requirements.

Wide variety of styles and shapes offered for your selection — all of them with the Berney-Bond-Winslow features of superiority.

U. K. Milk Coolers

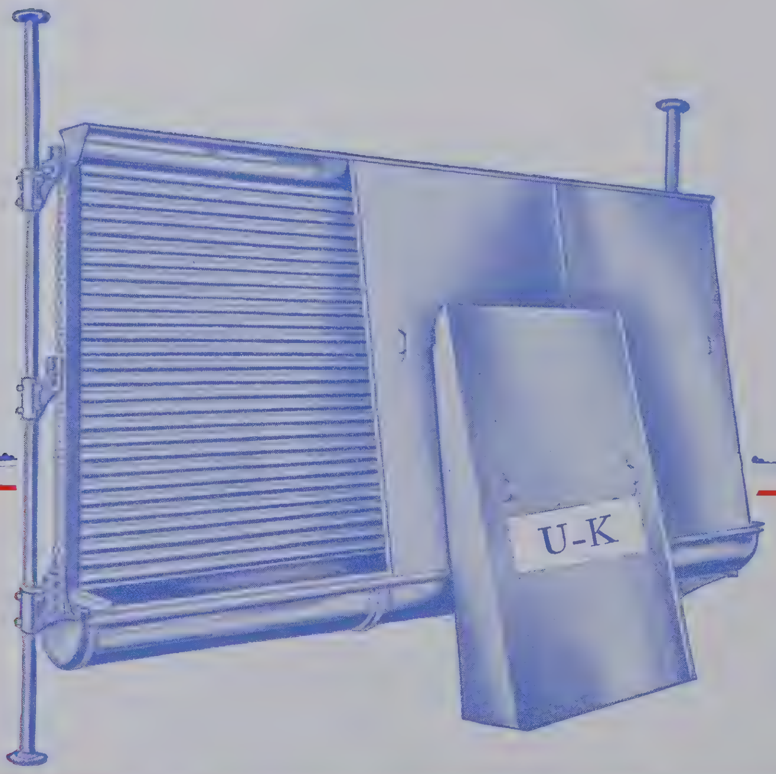
CHECK BACTERIAG ROWTH

Uhlmann-Kinsey Co.
Incorporated
PHILADELPHIA, PENNA.

THE U. K. system of cooling makes the milk take an immediate drop in temperature after pasteurizing, and puts a positive check to renewed growth of bacteria. The bottom tube, immersed in milk ready to leave the cooler, is the first to receive the cooling medium and gives the milk an extra drop in temperature to hold over until it reaches the storage tanks or filling machines.

All tubes in U. K. Coolers are seamless and made of 18 gauge copper heavily tinned inside and outside. They are sweated into position on the manifolds to make them leakproof and add strength. ∴ ∴ ∴ ∴

Extra large manifolds or end pieces insures a steady flow of the cooling liquid to give you full benefit of the brine or spring water used. U. K. Coolers are guaranteed to withstand a pressure of 150 pounds. Write for booklet giving complete details. ∴ ∴



U. K. Coolers are made in a small size for farms, standard size for milk or ice cream plants, and a giant size for large dairies. Any size, any capacity, or any combination of sections can be built for your needs.

ORE PROTECTION FOR THE MILK CONSUMER.

Until recently, in New Haven and in many other aces in the state of Connecticut, restaurants, lunch- oms and drug stores have been buying milk in 10 40-qt. cans to be handed out to the customer by glass pitcher. It has frequently been the practice to fill e glass or pitcher by dipping the milk with a ladle or her utensil directly from the can to the glass. In her instances the milk has been poured from the can to a milk pump and from there to the glass.

This practice has two glaring faults. First, there is nsiderable exposure of the milk between the can and e glass. Milk can be easily contaminated by the per- on working with it. There is also a good opportunity r dust, dirt and flies to infect the product. Secondly, ilk dispensed in this fashion cannot be kept well mixed. hose served from the top of the can will get rich ilk and those who happen to order milk when the can ets low are likely to get nothing but skim milk.

For these reasons, the state dairy and food commis- ion presented to the last legislature a bill making it llegal to serve milk from restaurants and other places f public entertainment, except in the original package eceived from the dairyman or milk dealer. The chief riticism to this bill before its passage was that it would ncrease the cost to the consumer from five to ten cents glass. As a matter of fact the price at most places s ten cents and if it should cost a little more the added leanliness and assurance of a satisfactory cream con- ent would be well worth it.

The bill passed and became effective July 1. The ection under discussion reads as follows:

> "Milk, when served by any hotel, restaurant, lunchroom, ountain or other place of public entertainment, shall be erved in the original bottle, the cap of which shall not be emoved except in the presence of the consumer or patron, ut this provision shall not apply to cream so served." Sec- ion 2, Chapter 232, Public Acts of 1927.

There has apparently been considerable question among restaurants and lunchrooms as to just what this law covers. The interpretation of the commissioner of dairy and food clears up a number of points. This law does not include the serving of cream or buttermilk. It does not include the small amount of milk that may be served with coffee and tea. It does not include soda fountain milk drinks so long as these beverages have something in them besides milk.

On the other hand, milk is not to be served with cereals, crackers, etc., unless the milk is served in the original container. It is perfectly proper in hotels, for example, for the waiter to bring in the milk in the original container to the customer and then pour it into a glass or pitcher.

Dealers in New Haven are prepared to sell milk in pint and half-pint bottles to the restaurants and lunchrooms for this purpose.

While there has been some confusion and misunderstanding both on the part of the general public and the managers of food and drink selling places relative to this law, it is expected that within a very short time this new regulation will be in satisfactory operation in New Haven.—New Haven, Conn., Department of Health Bulletin.

FLAVORS in MILK

Their Causes, Reactions, Preventions and Effect Upon the Trade and Consumption of Milk

Information Distributors Should Impart to Producers

By WM. H. E. REID, *Associate Professor Dairy Manufactures, University of Missouri, Columbia, Mo.*

(Continued from the August Issue)

IN a great many cases milk becomes flavored from sources other than bacterial infection. It is well known that milk readily absorbs any volatile substance with which it comes in contact. It is sometimes thought that flavors occurring in milk are due to this absorptive capacity rather than the growth and development of the various fermentative organisms. While the facts may seem absurd, still it must be understood that the principle does operate to a considerable extent and off flavors are often produced through these physical processes. Milk possesses the absorptive property to a marked degree, for not only does the fluid serum absorb volatile flavors, but the fat also has a great attraction for these substances. Besides the flavors absorbed subsequent to milking, milk invariably has a more or less pronounced flavor that is derived directly from the cow. While not too much is known concerning the nature of these peculiar flavors, it is obvious that they exist and are imparted to the milk. When animals consume feeds that are rich in any particular flavor, it is imparted to the milk. The flavor of onions and many of the other highly flavored feeds can be recognized on the breath and in the milk within a very short time.

This diffusion through the system of the cow by means of circulation and subsequent absorption by the milk makes it necessary to use considerable care in feeding certain feeds that contain these flavors to cows whose milk is to be used for direct consumption.

It has been observed that regardless of the feeds used and the care taken each cow imparts to her milk a more or less individual taste. Cows receiving the same kind of feed and flavor develop bitter, salty, strong, or flat flavored milk as well as milk having a very pleasant flavor. The absorption of pre-existing flavors may be attributed to one of three causes, namely, the internal or physical condition of the cow, those absorbed within the body of the cow from highly flavored feeds, and those absorbed into the milk after production.

The occurrence of bitter milk is often associated with the feeding of certain substances, notably mouldy or decomposed fodder, beets and turnip leaves, raw potatoes, etc. The use of mouldy or decomposed straw for bedding gives the same results, which is believed to be due to an organism present on these materials which get into the milk.

If milk is stored in rusty cans until a certain degree of acidity develops, it acquires a bitter taste, due to the formation of iron acetate.

Fishy flavored milk comes from cows near the end of lactation. This off-flavor is believed to result from feeding fish meal or grazing cows on marshes subject to overflow with salt water. The milk may also acquire a fishy flavor from milk utensils which have not been cleaned or rinsed of soap, or it may result from rusty cans.

Undesirable feed flavors are caused from a number of different feeds. Some of the most common ones are silage, turnips, green alfalfa, beets, ragweed, early pasture and garlic. An interesting fact in connection with garlic is that it does not need to be injested by the animal to secure the flavor. Experiments show that the flavor of garlic is found in the blood of the animal as the result of inhalation in from ten to thirty minutes after inhalation. Garlic flavor occurs quite often in the spring of the year. This is because the cows feed on the onions, which are one of the first plants to start in the pasture in the spring. The trouble with garlic is not likely to last very long, as it is cropped off early and is replaced with grass which is eaten by the cows in preference to the onions.

As milk is exposed during the milking process and often after it has been drawn into an atmosphere that contains odors of an undesirable character, it may contract flavors by direct absorption. The peculiar stable odor is due to the volatile products that are escaping from decomposed or decomposing manure, or fermenting foods and exhalations from the animals in the barn. Under ordinary conditions the barn air is saturated with these products, and even in a well ventilated barn where considerable care is taken to purify the air they persist to a greater or less degree in spite of all efforts. There are many feeds that impart the characteristic flavors to milk, among which are silage, beets, turnips, cabbage, carrots and others. This is not ordinarily due to the ingestion with the substances of the feeds that are responsible for the flavors and their elimination with the milk through the udder, but to the absorption by the milk of the flavors of the feeds from the air in the stables.

Milk sometimes acquires flavors through the process of removal of other flavors. During the process of pasteurization, under the supervision of some inexperienced person, the milk may be heated too much, thus imparting to it a cooked or scorched flavor. This is not a serious flavor, but like all other flavors have its influence upon the consuming public. Pasteurization may disguise faulty milk, but will not improve it. In the end the pasteurized flavor will be worse. Heating too long causes the cooked flavor, while heating too rapidly gives the scorched flavor.

Milk may apparently have a good flavor when bottled for delivery, but after a while there may develop a musty flavor. This is caused by improperly paraffined caps, the flavor resulting from the contact of the milk with the caps. It is also associated with milk that has been held in damp, unventilated places at a low temperature for a period of time.

Pasteboard flavors may be noticed in milk which has been heated or allowed to stand in bottles without removing the cap. Where the cap is not sufficiently paraffined this flavor is imparted, but it is very volatile and is not considered a serious fault.

Tallowy or candle-like flavored milk is sometimes observed and is caused by exposure of the milk to sunlight. Milk exposed to sunlight in dark bottles will not show it. Oftentimes the housewife leaves the milk setting on

AMERICAN EXPRESS

At 11 Rue Scribe, Paris—One of many American Express Offices in Europe for the convenience of its patrons.

A Vacation in

EUROPE

For the Members of the

CONGRESS!

FREEDOM from humdrum routine; social prestige; educational benefits; and the sheer thrill of adventures in strange lands, await the members of the World's Dairy Congress in Europe. This glorious vacation begins at New York, on June 9, 1928, the day on which American dairymen, their families and friends, will board the magnificent, luxurious S. S. Leviathan for Cherbourg.

Our main mission in Europe is, of course, to attend the World's Dairy Congress, the greatest international convention in the history of dairying, to be held in London, June 26 until July 4.

The Congress has been arranged to allow time for a ten day tour before it opens. An interesting itinerary has been prepared by the American Express Company, which begins immediately upon our arrival at Cherbourg, on June 15.

Paris? Paris—of course! That is our first stop. Then through the smiling land of France. We visit historical Brussels. A trip of exceptional interest to us dairy men will be taken by steamer from Amsterdam, to the quaint Isle of Marken, and through Volendam, Edam and Monnikendam, the dairy and cheese-making country. This pre-convention tour terminates upon arrival in London, just in time for the first meeting of the Congress.

Fascinating post-convention tours have been arranged, all moderately priced, with an eye to giving us the best in travel, in comfort, in enjoyment, and the most for our money.

There is one post-convention tour to Germany and the Scandinavian countries.

Another tour takes in Switzerland, the Alps, Italy, Venice, Florence, Rome, Nice and Lake Geneva.

It is not too early to make arrangements for your trip NOW. Remember, "THE EARLY BIRD GETS THE BEST RESERVATIONS!"

All information you may desire—dates, prices, etc.—will gladly be sent you if you write to

The Olsen Publishing Co.

New York Pattern

Some of the firms to whom we supplied cans this year have continuously used K-W products ever since the Keiner Williams Stamping Company was first established.

Today such a record means something. Folks don't go on year after year buying the same brand of can unless they are convinced that it's the best they can get.

K-W Milk Cans

We are going to make sure that K-W cans always are the best articles of their kind that you can get. Whenever we can find a way to improve K-W cans—to give them greater durability and longer life—that improvement will be made.

K-W cans are quality cans produced at low price through quantity production methods, under rigid supervision.

the porch for a while after it is delivered, but ordinarily the producer will receive the blame for the thing h could not prevent, and which was not his fault.

Gasoline and kerosene flavors are very objectionable They are usually attributed to having gasoline and kerosene in the milk utensils, which have not been thoroughly cleaned. The flavors may also be absorbed from the air that is saturated.

Metallic flavors are usually due to a chemical reaction, which is influenced by light, air or heat. It may be an oxidation process facilitated by copper, iron metallic alloys, or their salts acting as catalyser. Acid assists in the reaction, but is not necessary. It is also caused by the use of rusty or poorly tinned utensils, and by the action of bacteria as was already mentioned.

Oily flavors are either due to some fault of the fat of the milk, or are absorbed. The more solids there are in proportion to the fat, the less likely the oily flavor is to appear, especially in pasteurized milk, since the casein protects the fat globules during heating. Other sources of oily flavors are those that result from the use of too much oil on the separator or other equipment and it gets into the milk.

Having briefly described in a general way the origin of the various flavors that are to be found in milk from time to time, the practical question arises as to how these difficulties can be overcome, if they are present. Often little or no attention is given to the conditions that may result in off-flavors so long as the milk supply is normal It seems that only when the trouble arises that steps are taken to abolish the cause. If the milk dealers could realize that prevention is worth more than cure, he could see the necessity of understanding the conditions that surround the defect. The first step is to accurately determine the cause of the difficulty, because successful measures cannot be conducted against the cause unless it is known.

From the foregoing material the milk producer can easily determine whether the defect is a living organism or whether it is the result of some physiological disturbance of the animal or whether it is due to direct absorption. If the flavor is due to some abnormal fermentation, it may be treated by two general methods Eradication, by eliminating the inciting cause, and by chemical disinfection. Many of the bacteria producing a flavor in milk have several sources. The most likely sources of infection of this character are those that are due to contamination from water supply, hands of the milker, cans, pails, coolers, and other utensils, transportation, air and dust from the stables, bottles, and from the cows. Cleanliness is a vital matter to consider in the production of wholesale milk. When dirt gains entrance to the milk, it may impart an undesirable flavor. It further contaminates the milk with many species of bacteria which ferment the milk constituents decomposing one or more of the constituents, producing off-flavors.

In order to avoid unnecessary contamination of milk it should be produced and handled under strictly sanitary conditions. The barn yard should be kept dry and free from manure so that the cows are not compelled to wade in mud before they enter the stables. The stables must be kept free from accumulation of dirt and the manure should be removed daily. The bedding must be clean and the stable sufficiently ventilated to eliminate all odors. Sprinkling the floors just previous to milking prevents excess dust in the air. Brushing and grooming the animals to remove all loose hair and moisten the parts to prevent the dust particles from falling, will materially diminish the danger of contamination, and

Overcome Your Sweet Cream Troubles

wiping the udders off with a damp cloth is a practica practice.

Cleanliness of all milk utensils is another essentia factor in the production of good flavored milk. This includes pails, cans, strainers, separators, and any other utensil used in handling milk. A milk pail which seems clean to the naked eye may still contain an invisible army of bacteria waiting only for warm milk in which to multiply. Sterilization is the solution, and this is accomplished only through steam, boiling water, or commercial hypochlorite disinfectants. Milk utensils should be thoroughly washed with a washing powder and a brush after each using, then steamed, scalded or rinsed with a good disinfecting solution and allowed to dry in the sunlight. By eliminating one source after another the milk producer can usually find the direct cause, and then by instituting more rigorous measures in regard to this, he can in the future avoid a repetition of the difficulty.

When the flavored milk is a result of direct absorption of pre-existing flavors, the treatment is wholly different from that employed where bacteria are the cause. If the difficulty is due to absorption after milking, it can easily be prevented by removing the milk from the odoriferous source. The milk house should be well ventilated and free from all objectionable odors.

Should the flavor be present at the time of milking, undoubtedly it can be traced directly to the animal. It may be due to the normal cowy odor or to the cows eating certain flavor-producing feeds and weeds. In case the trouble is due to the feeds, the intensity of the flavor in the milk can be diminished by regulating the time of feeding and the amount of feed given. The surest way to reduce the flavors is by feeding four to six hours before milking or wait and feed the cows after milking.

Since certain weeds, especially wild onions, garlic, ragweeds, etc., impart to the milk their characteristic flavors, and the cows gain access to them in infested pastures, their prevention are more complicated. The surest way to prevent their flavor in milk is to completely eradicate them from the pasture by burning, plowing up, and rotation of crops. If this is not possible, the cows removed from the infested pasture four to six hours previous to milking will tend to reduce to a great extent the characteristic flavor imparted to the milk.

Various methods have been devised to aid in the elimination of undesirable flavors in the milk after they have been absorbed. Aeration brings the milk more or less completely in contact with the air, allowing an opportunity for the escape of those volatile substances. Aeration performs a double effect. Besides airing the milk, the temperature is lowered so that the effect of cooling is accomplished to a certain degree. To secure the greatest possible results, aeration of milk should take place at body temperature, and the milk carried out over the greatest surface possible as slowly as possible in the presence of a pure atmosphere. It is best accomplished just after milking and before cooling, as airing and cooling simultaneously conducted cannot yield the most satisfactory results.

Pasteurization is commonly practiced to eliminate undesirable flavors from milk. The chief purpose of pasteurization of milk is to improve the flavor, prolong the keeping qualities, and destroy all disease bacteria. Primarily pasteurization improves the flavor, because it kills most of the bacteria that break down the milk constituents and form decomposition products, and destroys a great majority of the ferments present that are responsible for producing objectionable flavors. Pasteurization expels from the milk along with the steam vapors

Bottle washing costs drastically cut with OAKITE

BOTTLE washing costs were too high to suit a certain southern dairyman. His expenditure for cleaning material alone averaged $1.87 per day—nearly fifty dollars a month.

Using Oakite, however, immediately reduced this amount to less than one-third of that figure! And the bottles are ***clean***. They have a bright, attractive lustre, and are entirely free from surface film.

Other dairymen have had similar experiences. They find Oakite most economical and effective.

You, too, will find it so. Write ***now*** for complete information.

Oakite is manufactured only by

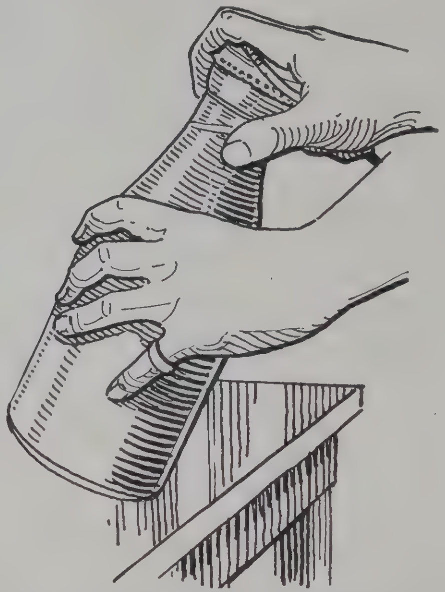
THE

DACRO

METAL CAP

Here at last is the perfect package of Milk or Cream, pure and sweet pasteurized IN the bottle! Made possible by a mechanically perfect closure.



Pure, sweet MILK—delivered under hermetic seal to the home. Handy openers supplied at small cost.

The Dacro Metal Crown—This remarkable cap is made on exactly the same principle as the famous Crown Cork which revolutionized the bottled beverage industry. The Dacro Crown is a hermetic seal. It automatically locks under the glass rim of the bottle. It is scientifically a perfect closure. Sealed with the Dacro Crown, Milk or Cream can be pasteurized in the bottle, an exclusive advantage of this seal. The Dacro Crown covers and protects the pouring lip. It KEEPS clean milk clean! No danger of contamination or tampering with pure contents. And the Dacro Crown can be replaced for temporary covering and seal after opening bottle.

and gases, the objectionable volatile substances that are in the milk. The best results from pasteurizing milk is to be secured when it is heated for thirty minutes at 45 degrees F.

After milk has been pasteurized, it should be cooled as quickly as possible to 50 degrees F. or lower. In the pasteurization process a large majority of the bacteria were killed, but since a few survived the heat, the milk must be cooled immediately to check the bacterial growth. Oftentimes morning's milk will sour before the night's milk, because the night's milk was cooled at once, and remains that way during the night, while the morning's milk was not cooled, but put into the cans for prompt delivery. There are various ways of cooling milk, but the only practical way on the farm is by the use of a properly insulated tank filled with cold water. Frequent stirring of the milk will allow it to cool faster and more uniformly. The bacteria are not killed by cooling, but they cannot thrive very well at a temperature around 50 to 55 degrees F.

In considering the flavors in milk we will find that they are the index to wholesomeness. The problem that confronts the dairy industry today is that of causing the public to consume more milk, and this problem is affected more by the flavor than any other item. Ample evidence is at hand to show that whenever the quality of dairy products improve, the consumption also improves. When more milk is used it is because the consumer recognizes the quality as evidenced in the flavor more than any other thing. The public may be told of the healthful properties of milk, but unless the flavor appeals to their taste, they will ignore the fact. Children are especially quick to distinguish betwen good and bad flavored milk. One dissatisfaction of undesirable flavored milk is the consideration of the unpleasant effect upon the consumer. Delivering such milk usually results in losing the confidence of the dealer, or if the milk is delivered direct to the consumer, it means the loss of a good customer. A reputation for clean milk means fewer complaints, a better class of customers, and a steady market for the dairyman's products. Safeguarding the purity of the milk is a protection to the health of the public in general.

⁂

CALIFORNIA DAIRY COUNCIL ADOPTS CODE OF ETHICS.

The California Dairy Council, with headquarters at Los Angeles, Calif., has adopted a code of ethics, the most important points of which follow:

To take pride in our business.

To produce and handle dairy products of highest quality.

To place California Dairy Council foremost among our business activities.

To believe in California Dairy Council as the heart of the industry.

To strive to correct abuses and unethical practices in our business.

To treat alike both old and new customers.

To guarantee the same price, quality and service to all.

To strive to retain the good will of our own and our competitors' customers, for the benefit of the industry.

To recognize the right of the producer to a fair price for his product.

To apply the Golden Rule to every transaction.

UP GOES THE TEMPERATURE

As the days grow hotter and hotter, the thousands of Dairy products manufacturers who standardize

Wyandotte
Dairyman's
Cleaner and Cleanser

for all their plant and equipment cleaning are more definitely convinced of their sound judgment.

This cleaner is so pure and purifying; is so easy to use and handle; is so uniform and dependable in its action; is such a thorough rinser and deodorizer that their cleaning operations are established on a basis of reliability and economy.

Here's Convincing Proof

As one Creameryman said recently—

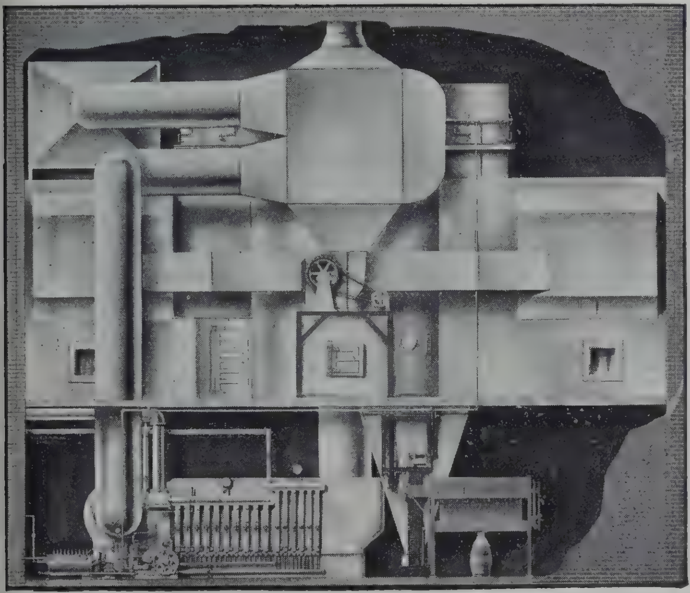
"I purchased a Rogers Spray Process Milk Powder Plant because—

Rogers gave me two distinct plants—a complete CONDENSING UNIT and a complete MILK POWDER PLANT; thus enabling me to take advantage of the condensed milk market when prices are high, as well as the milk powder market—and *the cost of these TWO COMPLETE UNITS was no more than others ask for a milk powder plant alone.*

"And then the saving on royalties alone meant at least $100,000.00 to me. (Rogers is the only Spray Process Milk Powder Plant that does not require you to pay royalties.)

"Another thing—Rogers Spray Process Milk Powder Plant costs no more than other Spray Process milk powder plants—yet I found it produces nearly three times the quantity of milk powder—of uniformly higher quality—more readily and completely soluble—gives complete recovery of solids—eliminates second grade powder, and gives you any texture desired.

"I also found that the Steam, Power and Labor costs per pound of powder produced on a Rogers Spray Process Milk Powder Plant were considerably lower than other spray process milk powder plants."



If you want more convincing proof of the superiority of Rogers Spray Process Milk Powder Plants let us turn you loose in one of the 20 Rogers Spray Process Milk Powder Plants now in operation in this country—you'll soon be convinced.

Send for complete information on MILK POWDER—its Manufacture, Uses and Money Making Possibilities.

PERFECT!

The ATWOOD

— FOR —

HORSE GROOMING

FIRST IN THE FIELD—and many years of experience since, has made the Atwood vacuum machine for horse grooming perfect in every detail. Substantial, strong, and rugged, it will last a lifetime. The tool will get down to the skin and loosen every particle of dandruff, dirt and dust. This dirt is not only dislodged, but completely removed, and with it go all vermin, to a sealed container where they die. It eliminates skin diseases and other horse ailments, and requires less than one-fourth the time to do a more perfect job of grooming. Let us show you how other dairies have found the Atwood a profitable investment.

Better Horses at Lower Feeding Costs

BOWMAN DAIRY COMPANY
BOWMAN

Bowman Dairy Co. of Chicago have proved it. They are feeding to more than 1200 horses crushed oats made with

GIBSON OAT CRUSHERS

There is a minimum guaranteed saving of 15% in crushed oats over whole oats or mixed feeds. A 30 day free trial of a complete machine will prove it. There are 7 different sizes of Gibson Oat Crushers with direct connected electric motors or with pulley for belt drive.

Write today for further information. Tell us how many horses you are feeding and we'll tell you how to buy a Gibson out of your present wasted oats.

Ask any of these about us:—

CANADA TO U. S. MILK SHIPMENTS MADE UNDER TEMPORARY PERMITS.

A report from the department of agriculture at Washington regarding importations of Canadian milk reads in part as follows:

"Shipments of milk and cream from Canada to the United States are proceeding regularly under temporary permits in compliance with the federal import milk act passed at the last session of Congress, to promote the dairy industry of the United States and protect public health in this country. While funds are not yet available for the enforcement of the act, an understanding has been arrived at between the Canadian and United States authorities for the continued shipment of Canadian milk and cream with the Canadian government assuming full responsibility for compliance with the provisions of the act. The only period during which there was a complete embargo was from March 27 to May 6, 1927, a period during which, however, the Canadian output was seasonally heavy. Notwithstanding this interruption of the trade, the total imports from January to July were probably slightly heavier than in the seve months of last year, and would otherwise have conside ably exceeded those of recent years, according to a r port of August 9 from American Vice-Consul Ernest Monroe, Sherbrooke, Quebec.

"Exports of Canadian cream to the United Stat have been increasingly heavy in recent years, amountin in the year ending March 31, 1925, to 3,384,186 gallon in 1925-26 to 4,120,181 gallons, and in 1926-27 to 4,49 528 gallons. The export value of the 1926-27 shipmen was $7,750,233.

'The temporary permits for shipments are to be val only until such time as funds are available to the Unit States government for ascertaining that the provisio of the act have been complied with, whereupon noti will be given to holders of temporary permits of t necessity for submitting proof precedent to the issuan of permanent permits. Meanwhile, the Canadian go ernment has agreed to assume full responsibility for t condition of Canadian dairies and the cleanliness of t Canadian product."

More Trips Per Bottle mean More Profit to You!

THE most important item in buying milk bottles is the FINAL cost per bottle to you. The first cost or purchase price means little or nothing to you. From the actual experience of dairymen and from exhaustive laboratory tests, it has been definitely proved that Thatcher Superior Quality Milk Bottles will give at least five more trips per bottle. Thatcher bottles are tougher, more uniform in quality, have a better distribution of glass, and consistently perform better in actual service than any other bottle made. They are extra-reinforced at upper edge, shoulder and base edge.

Specially designed lehrs help to give Thatcher Bottles that Superior Quality and wear-resisting toughness not found in ordinary bottles. The Thatcher Trade Mark is blown on every Thatcher Bottle for your protection and guarantee.

Then, too, millions of milk users see and read the celebrated "A Bottle of Milk Is A Bottle of Health" advertisements of Thatcher Bottles in National Consumer and other magazines. If you want to save money on your bottles and increase your milk sales, fill in and mail the attached coupon. It will pay you to act at once.

A Bottle of Milk is
a Bottle of Health

DEFIANCE
Semi-Steel
MILK BOTTLE CASES

"The Strongest Case Made"

YEARS of use—that's what you can expect from Defiance Semi-Steel Milk Bottle Cases. No need ever to send these steel-bound cases to the repair shop. Your roughest driver can't smash or injure them. Every joint and corner is strongly re-inforced; and a 200 pound man can jump on either side of the partitions without bending any part of the metal.

¶ Defiance Semi-Steel Cases are practically indestructible. The corners, tops and bottoms are reinforced with strong, galvanized steel bands, and partitions and wires are made into one secure unit, heavily galvanized after assembly.

¶ A Defiance Case will outlast two ordinary cases, yet it costs no more. Write for quantity prices and specifications.

Who knows BEST how to build them?

YOU are an experienced buyer of dairy equipment; no manufacturer of can washers and bottle washers need tell you the machines he offers you are as good as he knows how to make them. You know that.

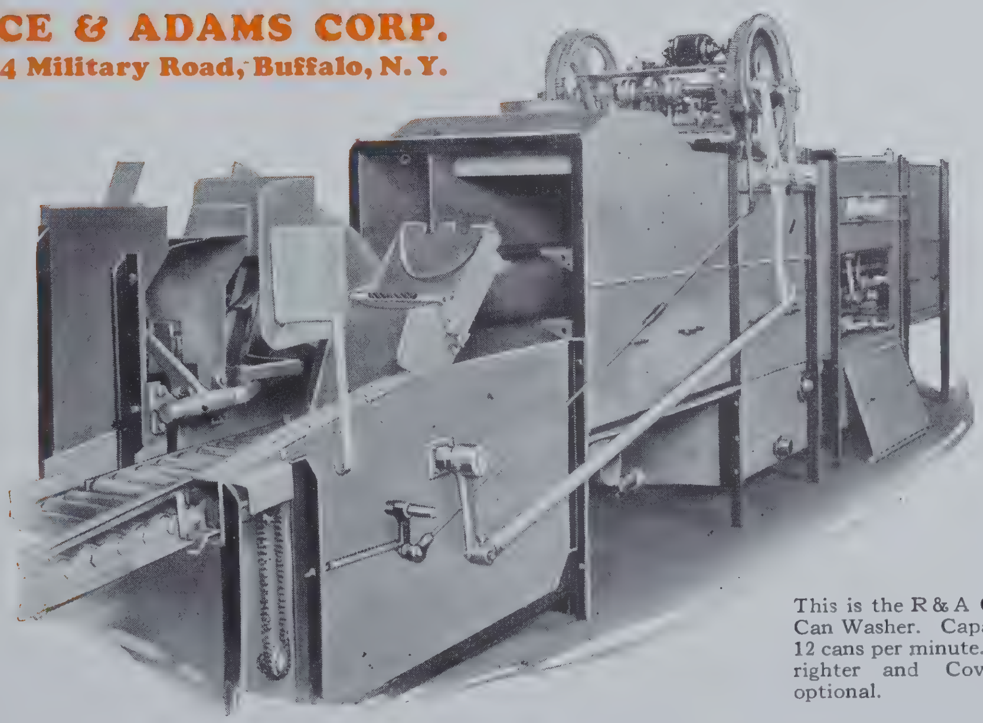
The question is "Who knows *best* how to build them? *And who does it?*" The answer to that is important to you because it can mean everything from complete satisfaction to complete dissatisfaction in the equipment you buy.

How clean does that can washer get the cans? How dry? Is it built to last? Does it operate smoothly and easily, or does it rattle and shake thru the job like a dilapidated flivver? How much does it cost to run? How easy to maintain? How equipped? What capacity? How much does it cost to buy?

The answer to these and many other equally vital questions supply the gauge by which you can determine what machine deserves a place in your plant.

Rice & Adams says—"R & A Washers—each in its class—are the finest you can buy." No apology need be made for the word "finest." You can prove that by simple comparisons. We will give you the facts on *our* machines at any time you desire!

RICE & ADAMS CORP.
1144 Military Road, Buffalo, N. Y.



This is the R & A Champion Can Washer. Capacity 3 to 12 cans per minute. Can-uprighter and Cover-placer optional.

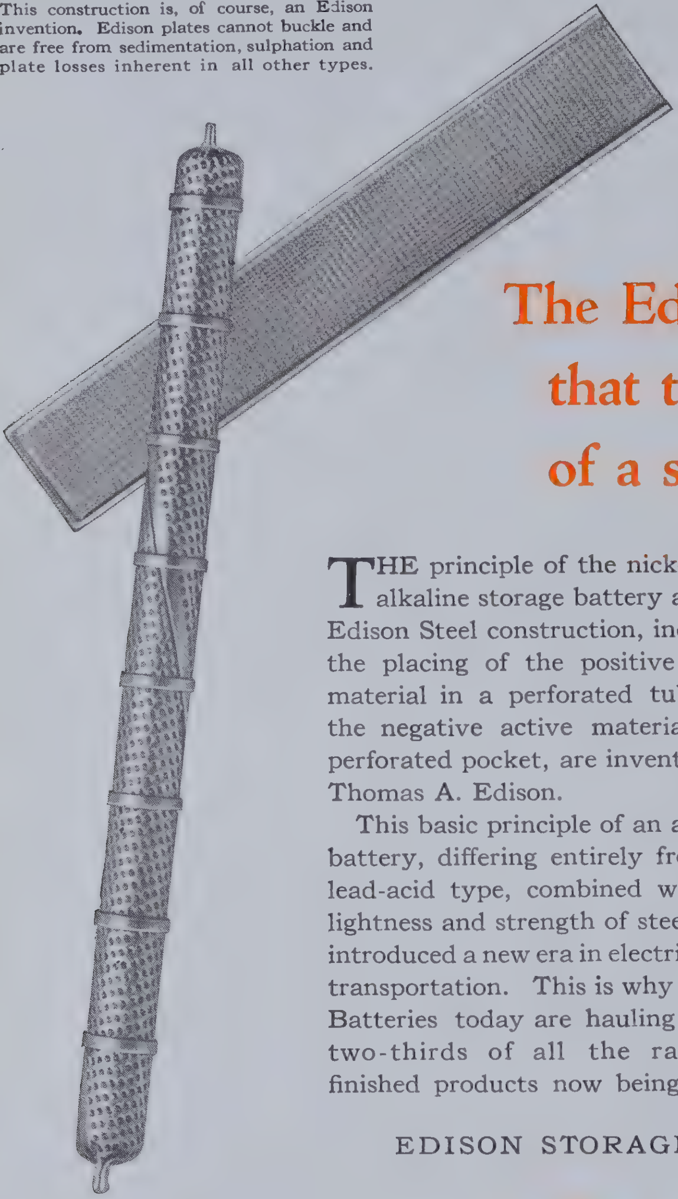
Edison Battery plates are made up of finely perforated *steel* tubes and pockets containing the active material, which are forced into *steel* supporting grids under great pressure. This construction is, of course, an Edison invention. Edison plates cannot buckle and are free from sedimentation, sulphation and plate losses inherent in all other types.



The Edison Inventions that trebled the life of a storage battery

THE principle of the nickel-iron-alkaline storage battery and the Edison Steel construction, including the placing of the positive active material in a perforated tube and the negative active material in a perforated pocket, are inventions of Thomas A. Edison.

This basic principle of an alkaline battery, differing entirely from the lead-acid type, combined with the lightness and strength of steel, have introduced a new era in electric truck transportation. This is why Edison Batteries today are hauling nearly two-thirds of all the raw and finished products now being transported by battery-powered vehicles.

The Edison Storage Battery, because of its distinctive features, lasts approximately three times as long in active service as any other battery of commercial importance on the market.

It is, of course, thoroughly dependable, requires little attention, and its lightness in weight adds from 500 to 1,250 lbs. to the payload capacity of the truck.

These advantages are responsible for substantial savings in the cost of electric delivery. Write for certified evidence of Edison performance in service similar to yours.

CHOCOLATE PRODUCTS CO.
CHICAGO. U S A

A Specially Prepared Chocolate for making Chocolate Milk, for ice cream, frostings, puddings, cakes, etc. Packed in 1-pound glass jars, double sealed. Will not mold or ferment but keeps sweet and fresh. Stimulates consumption of milk and makes dairyman a splendid profit.

See also page 140 in Olsen's Dairy Industries (Condensed) Catalogs.

No. 1 Hundreds of dairymen have been and are now using Morehealth Chocolate Syrup. Without question it makes one of the most delicious, appetizing Chocolate Milk drinks ever produced. This is due to the exceptional quality of the syrup, produced by the Special Process of Dr. Pashkow.

Morehealth Chocolate Syrup is made of pure cane sugar and the finest grade chocolate ingredients. It is rich, mellow, contains no coloring or preservatives and comes in plain and malted form.

Our "Silent Salesman"—a unique plan of effectively advertising Morehealth Chocolate Milk to the housewife is furnished free with each order of syrup.

No. 2 Realizing the opportunities open to them many dairymen are going into the Chocolate Milk business on a larger scale by installing sterilizing equipment.

For several years we have made a careful study of this subject and as a result have worked out a *Special Process* that produces a Chocolate Milk of unequalled quality. In fact, we are now in position to give the dairyman a *Contract* that positively *Guarantees* that his product will keep indefinitely.

Send today for free samples of Morehealth Chocolate Syrup and our Special Proposition for bottling Sterilized Chocolate Milk.

HE ROMANCE OF MILK MERCHANDISING.

(Continued from page 41)

ewing, foul-languaged boys put up their gloves for t last time.

Don't boast of something that is supposed to have been settled long, long ago—even before women started wearing knickers.

Just remember that you are dealing with a class and a race that must have their fun, their pleasure, and if u haven't anything interesting to offer in this line, ey don't want any of "them onions." That's all there to it. It is not a hard-boiled race; it is simply a free, fnk and easy race that speaks straight from the oulder.

Put fun in a bottle of milk. Pack a ton of exhilaration, excitement in a bottle of milk. Stuff a handful of olic in a bottle of milk. Then you are going to sell mething.

Now, we'll go back to the beginning, to the point here we sketched that filmy, flimsy dreamy cloud of umber. You didn't get that point well. Here's the int:

I am finishing this article. I am tired. It is 10 clock. I have written this article at the close of a rd day, for we are an intense people in this country of urs, and we pack everything we can in a day's work or day's pleasure, and my day has been just as full as urs.

I am fixing to go to bed. I know, however, that unss I take a tonic I shall not rest well. You see, my art is beating fast. My pulse is quick. This all came out because I was, unconsciously, speeding up my iner mechanism to drive home the points of this article.

There is a medicine cabinet in the bathroom, on the ay to the back bedroom. It contains about the avere run of household remedies—and all of about the erage usefulness. I shan't touch a one of them. Not e. Not a single aspirin tablet. Not a bromide.

I am going out on the back porch. I am going to our out a vessel of milk. I am going to warm it till it a little more than tepid. Then I shall slowly drink , just sip it.

In 20 minutes I shall be in bed, and I shall be sleepg on those dreamy, silken clouds that I just pictured, eeping not the sleep of a man after a hard, troubled ay, but the sleep of a man who is restful and soothed, ho is contented and satisfied, who is looking forward the breaking of a new day and a new sun and new pportunities for work and play.

Now, milk will do this. And how can anyone fail appreciate the marvelous magic of the greatest medine, the greatest soother of strained nerves, the greatest nic, the greatest creator of romance the world ever new!

If you can, then—
Good night!

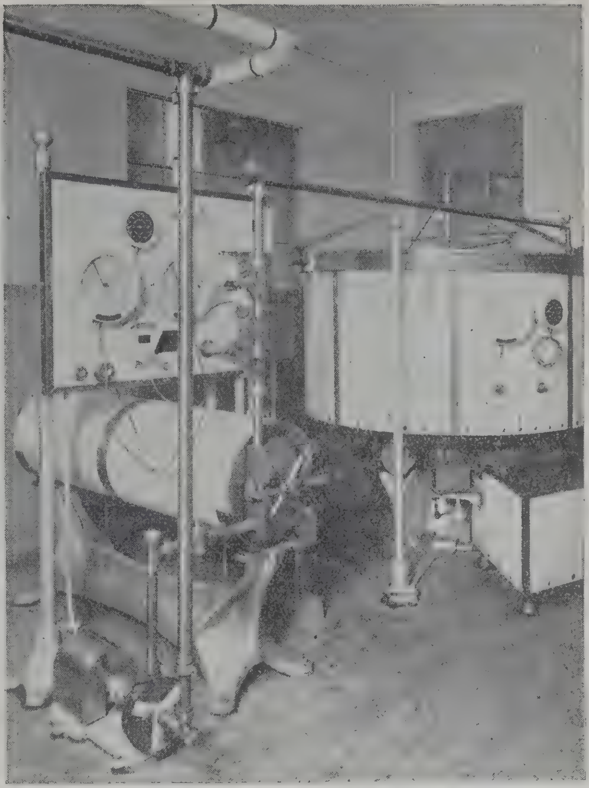
⁂

A VISITOR FROM ARGENTINE.

Mr. Ramiro Jouan, manager of the "La Vasconada," 974 Tacuari Buenos Aires, Argentine, South merica, was a caller recently while on a hurried trip to ur city.

Mr. Jouan is manager of the largest milk distributing mpany in his city, also making considerable butter. e plans to engage in the wholesale ice cream manufacuring business as well.

Mr. Jouan has spent several months in Europe and ill sail from New York for home soon.



Showing cream pasteurizing equipment. Instruments on panel board at left automatically control and keep account of temperature and flow of cream at all times.

Something About The Sunlight Milk Plant

For many years The Bristol Company has provided instrument equipment which has helped to make the Wanzer Dairy one of the outstanding plants of its kind in the Chicago district.

Now, this new unit, The Sunlight Milk Plant, conceived and built according to ideals fostered through seventy years of dairying experience, has STANDARDIZED ON BRISTOL EQUIPMENT.

Recording Thermometers stand sentry duty at many strategic points, providing the accurate guidance which makes for a quality product; while temperature control equipment and flow valves automatically control the temperature and rate of flow of milk and cream at vital stages.

The simplicity, freedom from trouble, and ruggedness which characterize Bristol's equipment, makes them ideal for dairy use; in fact there is a complete line, designed especially for this work.

In planning new economies for YOUR plant write for literature which describes "Bristol's" equipment.

TEACHING THE CONSUMER TO APPRECIATE MILK.

(Continued from page 50)

To return to the just-as-eager grown-up groups. Invitation was extended to all of us who could, to visit a certified farm when the dairy's organization went on a certain day. Some of us with cars at our disposal joined the procession and were amply repaid by the interesting inspection of an up-to-the-minute certified dairy farm.

Through schools, playgrounds, church groups, clubs, the work of educating the people of the city to an appreciation of the value of milk and a feeling of confidence in its purity is being carried on. It is a work which results in benefits as great for the consumer as they are important to the producer.

Tampa Dairymen Welcome Strict Code

CONSCIENTIOUS effort to establish and abide by a strict code for producing clean, healthful milk has swept Tampa, Fla.

It is manifest in a close co-operation between the Milk Producers' Association, Dr. E. C. Levy, city health officer, and Dr. C. L. Woolard, chief dairy inspector. This code has dictated most miraculous changes in local dairies, and has made most of the producers eager to supply Tampa's consumers with good milk that will be appreciated by them. Some few dairies, as is usually the case, have been done away with because they failed to heed the stringent requirements.

Milk Producers Mean Business.

"With the slogan, 'local production for local consumption,' these milk producers are sincere in their efforts to compete with shipped milk and are giving their customers an excellent product," says Charles A. Higgins, executive secretary of the Milk Producers' Association.

They are working under the handicap that they have to buy all of the feed for their herds, because the acreage of the farms in that vicinity is so small. It is said that if the entire farm were planted to corn there would scarcely be enough to fill a good sized silo. Yet these dairymen are starting out to resist the invasion of northern milk. Their association maintains an office and a full-time secretary, and seems to have for its motto, "100 per cent co-operation," judging from the way their plans have worked out thus far.

There are seven distributors and about forty individual dairies making deliveries in the city. The herds average from 200 to 50 cows, with the majority nearing 75 to 100. On these farms sanitary precautions are demanded and every animal and helper is subject to health examination at regular intervals.

Of course a campaign would not be entirely successful without instilling into the minds of the consumers that it is absolutely essential to take care of the milk after they get it. Also that milkmen are necessarily solicitous to the welfare of their milk bottles and do not like to have them used as decorations or receptacles for canned goods. Higgins reports that in one flower bed he saw a border made of 280 milk bottles. Most persons familiar with the distributing of bottled milk can recall similar sights they have witnessed.

Milk marketed in Tampa has been standardized into grades. "Grade A Raw" milk receives the most careful attention and is a remarkably healthful and delicious product indeed. Its companion grade is "Grade A Pasteurized" and likewise enjoys extreme care. "Grade B Pasteurized" is a good milk, but is not quite as carefully handled as the other grade. It is intended for average use and not for invalids or babies. "Grade C Pasteurized" is the lesser child and is either older or re-pasteurized. It is used only for cooking purposes and cannot be sold for other use.

Grade A raw and pasteurized, according to the code, "must be produced within such distance as to arrive regularly in Tampa within three hours from the time of leaving the dairy farm."

Raw milk of this grade does not have to be dated, but all pasteurized milk must be stamped and sold not later than the day following the day of pasteurization. This date must be stamped on the bottle cap. The order further states regarding the sale of milk for beverages or at soda fountains:

"Only Grade A and Grade B milk is sold for soda fountain or beverage use; and it shall be dispensed to the customer in the original container."

Mr. Higgins tells us that "it is unlawful for any hotel or eating house to bottle milk or have unused milk bottle caps in its possession. Buttermilk must be labeled to show whether it is cultured or a by-product from buttermaking and the rules which apply to sweet milk apply also to buttermilk."

Thus every precaution is taken to care for the milk after it is produced to the time it reaches the customer. And back of that, there are rules governing the care of farm animals and attendants which makes for clean milk.

Run Many Display Ads.

Dairymen in the vicinity of Tampa seem to have caught the spirit and have done everything they can to make the plan a success. They also have been quick to make use of the change by liberal advertising. The local paper carries several advertisements, large and informative, which boost milk and milk products. These dairymen are business men for sure.

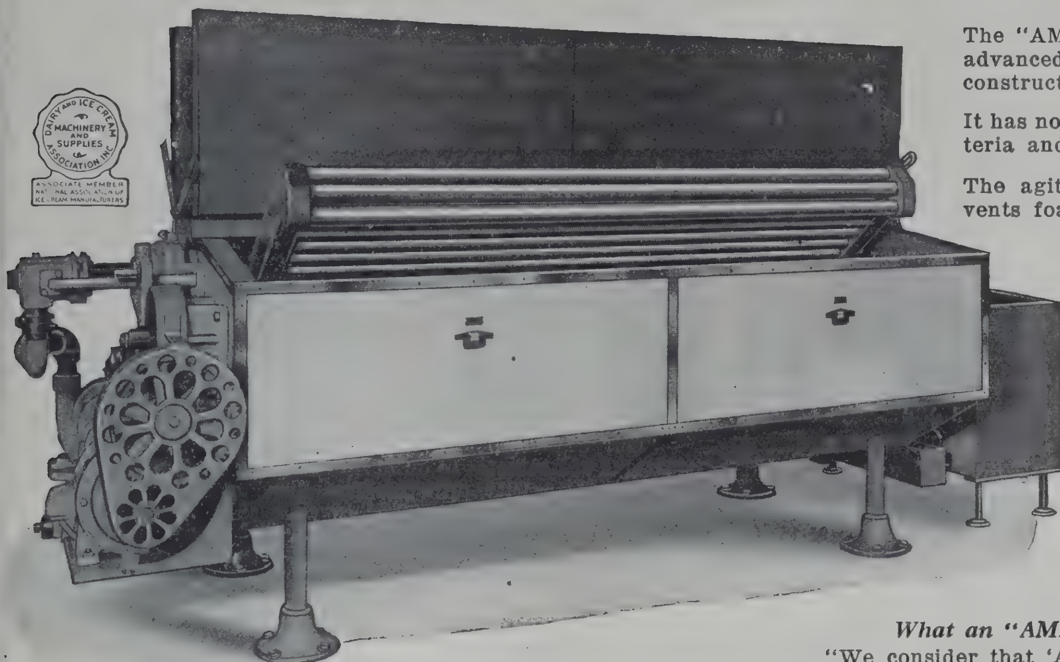
After all these precautions have been taken, the safety of the milk lies in the consumer's hands. He must do his share, say authorities, to keep the milk supply faultless.

YEAR 'ROUND ECONOMIES TELL THE TALE OF SUCCESSFUL DELIVERY.

(Continued from page 48)

In aiming, therefore, to establish a delivery car system that will operate economically throughout the full year, we must first see that our maintenance plan adequately keeps the delivery cars in condition with a steady flow of work for the repair force. We must have the right number of delivery cars, not too many, not too few, and aim to utilize them in other ways where they are not needed in the business. We must select equipment of the kind suited to handle the yearly business with the least possible waste. And, finally, we must watch our routing to continually devise ways to keep each truck assigned to a day's work really busy throughout that day, so that other delivery cars may be released from service with corresponding economy.

"AMERICO" THE PASTEURIZER WITH A PURPOSE



DAIRY AND ICE CREAM MACHINERY AND SUPPLIES ASSOCIATION INC.
ASSOCIATE MEMBER NATIONAL ASSOCIATION OF ICE CREAM MANUFACTURERS

The new "AMERICO" with improved coil control

The "AMERICO" embodies the most advanced principles in design and construction.

It has no stuffing boxes to gather bacteria and contaminate the batch.

The agitation is gentle. This prevents foaming, churning and breaking of fat globules.

Heating is done with water below 160° F. There is no burning on the coils nor scorching of the product.

The flush type outlet valve is standard on all vats.

Thorough cleaning of all parts is accomplished with ease as the coils can be raised out of the vat.

What an "AMERICO" User Says:
"We consider that 'AMERICO' is nearer perfection than any pasteurizer we have ever used."

A BUSINESS BUILDERS' CLUB.

(Continued from page 44)

looking on tours of school children as a favor done the schools, the Fountain City Dairy Company welcomes them, shows them its plant, explains the various operations through which milk goes before it is finally delivered on the back doorstep in the morning, and treats them to a half pint of milk and, perhaps, an Eskimo pie, too.

"Several years ago," said Mr. Steffen, "we suggested to the teachers that they bring the children to the plant—that the children would be interested in seeing how milk is handled in a modern dairy. We added that such a tour would be instructive too, and would give the children a new interest in their best food.

"Only a few such invitations were necessary. Now we get requests from the schools. They ask us to show the pupils our plant and to explain its operation to them.

"These tours of the children give us a splendid opportunity to talk about milk and its food value. Because we show the children 'action' as we talk, they are especialy interested—more than they would be in a plain lecture on milk. They see the men at the machines and watch the milk from the time it enters the plant to the time it is packed in cases ready for delivery.

"The talks we give are not really sales talks for the Fountain City Dairy Company's milk. We talk about milk in general, rather than about our dairy's milk, but the very fact that the children are seeing the processes and precautions of the Fountain City Dairy Company associates good milk with our name in their minds.

"Our dairy is the only one in Fond du Lac which pasteurizes its milk. The women's clubs and local physicians, as well as the newspaper in its editorial columns have been advocating pasteurized milk, yet, because it sells for a cent or two more than the raw milk, some people refuse to buy it. In our talks to the school children, we can show them how our milk is pasteurized and tell them how pasteurization kills harmful bacteria,—associatiing milk purity with the Fountain City Dairy Company."

In spite of the fact that the Fountain City Dairy Company has thirty competitors selling raw milk, this company leads in milk sales. The Fountain City Dairy Company for a long time has been pushing a compulsory pasteurization ordinance. The idea is quite popular, and it is only a matter of time when such an ordinance will be passed. The city council is waiting the action of the legislature, which is framing a model law relating to pasteurization.

In the meantime, the Fountain City Dairy Company is turning what is used by some prospects as an objection, into a sales argument. Twice a week the daily paper carries an advertisement which tells the public that the milk of the Fountain City Dairy Company is a perfectly pasteurized milk. The spirit of the Fountain City Dairy Company's advertising is reflected in a typical advertisement, as follows:

> **ATTENTION, PARENTS!**
>
> "In recent tests made by the state, it was found that about 10 per cent of the cattle are afflicted with tuberculosis.
>
> "Pasteurization kills all tuberculin, typhoid or other germs. Pasteurization is a safety measure for the public health.
>
> "Do not feed your children any kind of milk at school, but ask that it be pasteurized.
>
> "Our milk is perfectly pasteurized and has the right proportions of butterfat to build up the body of your boy and girl.
>
> "Fountain City milk is 'The Best' milk.
>
> "Be sure that it is served to your children at school.
>
> FOUNTAIN CITY DAIRY CO.
> Phone 3589."

Another means of advertising which the Fountain City Dairy Company is using to combat the price argument, answering it with one of "Better milk — better health" in the advertising folder. Once a month an educational folder is left by the deliveryman with the milk. These folders talk about milk and are written with an eye to educating the housewife and mother to use more of it, and to watch the kind of milk she buys. The folder illustrated herewith, "What Authorities Say About Pasteurized Milk," is typical of them. Medical men, recognized nationally as authorities, give their opinions on pasteurized milk, compared with raw milk.

"We have found that this direct advertising is especially effective. We business men, who get a lot of mail, often overlook the folder and the circular — we may throw them in the waste basket and forget them. But the average home woman gets less mail, and has more time to read what she does get. The amount of literature which she gets by way of the back door is small. She pays more attention to it, especially if it is an attractive folder telling her something about a subject in which she is interested—and what woman isn't interested in her children?

"These folders, coming once a month,—just often enough to continue to be a novelty and not just an ordinary happening—have done much to show our Fond du Lac mothers how to keep their families healthy with the right kind of milk, and are responsible for increasing milk sales by our company.

"We advertise in other mediums besides the newspapers. Twelve months of the year we are on the billboards. This billboard advertising and the newspaper advertising is directed at the mothers, but our moving picture theater advertising is intended for both the mothers and the children. This movie advertising is especially effective for the 'kids,' we find."

These are ideas which the Fountain City Dairy Company is using for the promotion of its business, both within and without the organization.

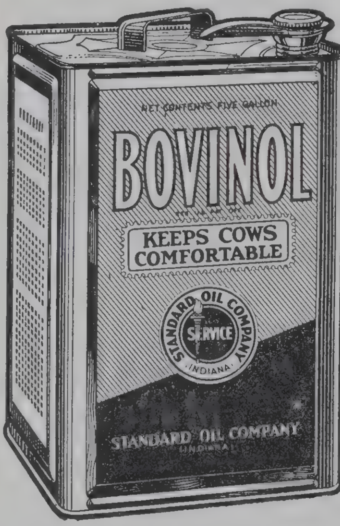
More Milk by Using

BOVINOL
REG U S PAT OFF

Agricultural experiments and practical dairy tests have proved that the consistent use of Bovinol will cause a 10% increase in milk production. More milk means more profit.

Bovinol protects cows from flies. Cows waste energy fighting flies. Scientists estimate that the energy used by an animal in fighting flies is equal to the food value of a pound of oats per head per day. Bovinol prevents this waste of energy.



It's easy to apply Bovinol—takes less than a minute to spray one cow. Use the compressed air type of sprayer in which the oil is forced out by air pressure and is further atomized by an air blast. Spray the cow night and morning, taking care to cover every square inch of the hide. Bovinol will thoroughly penetrate if you spray against the direction of the hair.

Bovinol is a pure and highly refined oil, stainless, odorless, and tasteless. It contains nothing that will irritate or injure the hide of the animal—in fact many dairymen use it as a dressing for cuts and scratches.

Cows will graze in comfort after being sprayed with Bovinol and your kindness will be repaid by larger milk yield. Every morning and every evening spray your cows with Bovinol.

COMMISSIONER OF AGRICULTURE WRITES DRASTIC ORDERS FOR COLUMBUS, GA.

Eugene Talmadge, commissioner of agriculture, Columbus, Ga., has just issued two drastic orders, one in reference to the manufacture of milk from "milk powders" and the other prohibiting the use of butter in the manufacture of ice cream. The orders follow:

"All hotels and restaurants, soda founts, and any place serving the public with such manufactured milk, emulsified or homogenized cream, shall post in a conspicuous place in their establishment a placard, heavy faced type, not less than one inch high, reading: 'We serve manufactured milk, homogenized or emulsified cream.'

"All places where ice cream is served made from manufactured milk and emulsified or homogenized cream will post in front of the soda fount, or in a conspicuous place in their establishment, a placard, in heavy faced type, not less than one inch high, reading: 'We serve cream made out of manufactured milk and emulsified or homogenized cream.'

"Anyone found violating the above ruling will be promptly dealt with."

EUGENE TALMADGE,
Commissioner.

"I ACCUSE THE MILK DEALER."

(Continued from page 45)

Certainly he cashed it. Did the check come back? It did. It was pure forgery. Nobody is going to jail about it, either.

Now, you may think that's funny. It isn't. That fellow is a member of the public. His freaky little mind is a little different from the main of us because he was out and out dishonest. It wasn't the five dollars. Nobody is going to risk a stretch in jail for five dollars. He just wanted to get away with something!

He got more kick out of putting over that little cheating game on that salesmanager than you or I would get out of landing a ten thousand dollar order.

I tell you we members of the public, who deal with milk dealers, are a funny sort of people. You ought to know more about us. You ought to have some contact people. You and I are strangers, Mr. Milk Dealer. If you just make up your mind to pay more attention to us both are going to profit, but you most of all, for then we won't be able to put anything over on you—and you won't let anybody put anything over on us. Because we won't stand for it. We spend our money with you. It's all right for us to put something over, but we howl like bloody murder when somebody tries it on us.

Now, there was a system of thievery going on in an apartment once. Milk and butter were mysteriously disappearing from in front of people's doors. We all raised the dickens with the company, thinking the driver was at fault. Some of us almost had fist fights with him, and if you have ever gotten into an argument with anybody at five o'clock in the morning, you can easily understand how it is not difficult to get in a fist fight at that time of the night.

But in the end we were convinced the driver was doing his duty. We almost cost him his job. We did make the company make good on all the milk and butter we lost. But after awhile it was discovered that the janitor's wife was getting away with these dairy products. What did she do with all of that stuff? Heaven only knows! She and her whole family couldn't dispose of it all the regular way if they ate seven times a day.

She was just born that way. Wanted to put something over on somebody, not in the innocent way, but in the out and out dishonest way.

Oh, of course, you are familiar with the various little tricks of putting over things followed by the boys and girls who crack the neck off a milk bottle, spit out a mouthful of glass, scream and swear they have been ruined by milk from a broken bottle. That's the softest graft known, one of my lawyer friends told me, for he said all milk dealers are suckers.

Just like that he said it, sort of contemptuously—"All of 'em—just suckers!"

If I were a milk dealer, just on general principles I wouldn't long stand for any such condition as that I don't advise everybody to go to court, and I know the milk dealer, as a business man, hates to go to court but I would fight that thing out with these hoodlums to a fare-ye-well.

Somebody with a flare for statistics might put out some figures showing how much it costs the milk industry not to know more about me—John Jones—and my kind. He ought to add to this total figure the amount of money the industry might make, which it isn't, by knowing more about us. It would, no doubt come to a staggering grand total.

There's a certain sort of satisfaction in doing business with a fellow you know. That's the reason I mentioned this little cigar store man in the beginning. He hasn't anything to do with selling milk except this: he shows how important it is to know a fellow, to make a man feel that he understands him, so that fellow will always come back to him when he wants to trade. I'll walk five blocks without a cigar just for the privilege of buying it from this boy.

And the funny thing about it is, I don't know his name!

But as I said before we people who spend money are particular. We want you to know us, to show an interest in us, to cater to us. You don't like that, do you? I don't like to have to do that either with the people I sell, but I do—because it's good business.

⁂

GOLDEN STATE MILK PRODUCTS COMPANY BUYS NATIONAL DAIRY STOCK.

The entire capital stock of the National Dairy Company of San Francisco, Calif., has been purchased by the Golden State Milk Products Company. As a result of the recent acquisition the Golden State becomes a complete unit in the creamery business, having production, manufacturing and distributing departments. It is said to be one of the largest organizations of its kind west of the Rocky Mountains.

In 1912 the National Dairy Company acquired several small companies and gradually built up a large business, and particularly since its $1,500,000 capitalization the Golden State Milk Products Company has expanded considerably.

It has dealt in the wholesaling of milk products in northern California for many years, having plants located at Oakland, Merced, Los Banos and Newman, the best dairy sections in the state.

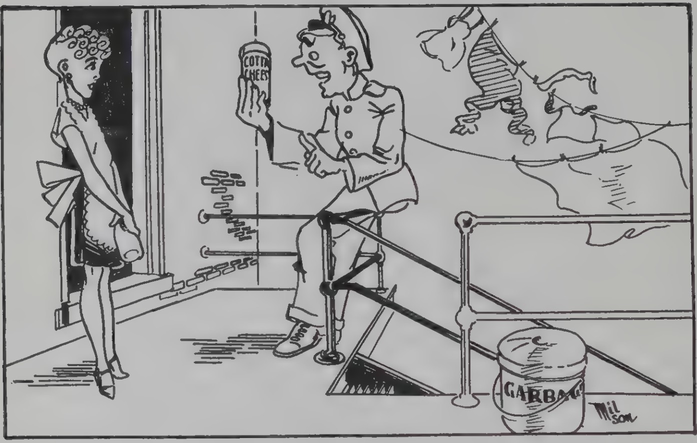
MIKE THE MILKMAN

BOOSTING SIDE LINES

I'm boosting side-lines every day and building extra trade that way! I'm boosting daily, if you please, our special brand of cottage cheese, put up in packages so neat they're mighty, mighty hard to beat! My boss was just a trifle slow on pushing cheese, I'd have you know; he figured there was small demand—just why I couldn't understand—and figured I would waste my words and waste my time in selling curds! But, I persisted, begged a chance, and gave the boss a song and dance: "I may not sell it, boss," said I, "but it can do no harm to try. Put it in packages like THESE, the proper size for cottage cheese, and I can almost guarantee you'll get good news tonight from me!" He yielded me my chance, and say, I did my level best that day! My Land of Living, how it went! I sold that cheese election bent! It went like lollypops and sweets, like patty-cakes and other eats, it went like cakes and butterscotch! I raised my chest another notch, I reared my chin an inch or so; it did me good to see it go! The boss was more than overjoyed. Now every driver that's employed is selling curds to beat the band—there surely is a fine demand! Since that worked out as fine as silk I tried our chocolated milk, and coffee syrup, don't you see, and say the boss has faith in me! He treated me supremely fine, equipped me with the proper line, and as I knew I surely could I more than made my promise good! It's working dandy every day, I'm stowing added sales away, I'M making money for the boss where formerly he suffered loss! I'm selling side-lines, as I said, and killing off the overhead!—J. Edw. Tufft, Grand Forks, N. Dak.



* * *

ALL MISSISSIPPI DAIRY CATTLE TO BE EXEMPT FROM TAXATION FOR FIVE YEARS.

Widespread interest has been awakened all over Mississippi in Gov. Murphree's announcement that he favors the exemption from taxation of all dairy cattle for a period of five years. The people of the state are very interested in the proposed plan to aid dairy farmers to secure a start in the dairy industry by holding their taxes down for a number of years.

Mississippi is naturally a dairying state, being blessed with climate conditions suitable to this undertaking, with eight months growing season, mild winters, which do not require stone housing for cattle, fine transportation systems, and many other advantages.

EDDIE PEABODY, BANJO KING, DRINKS EIGHT QUARTS OF MILK DAILY.

"In the business of leading an orchestra in these modern times when an orchestra leader must be everything from a tight-rope walker to an opera singer, health and vivacity are mighty important factors," says Eddie Peabody, king of the banjo and impresario-at-large, now appearing at the Fifth Avenue Theatre, New York City.

"And how do I retain my good health and ability to cavort across the boards daily and nightly as I have been doing since I have been leading an orchestra and between times making Victor records?

"It's a cinch! The big secret is simply this—drink milk and lots of it.

"Yes, sir! There's the secret of the whole thing. Why if more people knew what just plain, ordinary, pure milk could do for them and would follow the hunch, sickness would soon be an unheard of thing and even the 'tried business man' could sit through an afterdinner speech without going to sleep on the third word.

"It might sound offcolor to persons who are not accustomed to drinking milk, but I drink eight quarts of milk every day.

"Of course, I don't drink much of anything else—there isn't any room for it, but for me my health must be at top-notch every minute or I can't give the public the kind of performance they have learned to expect and appreciate.

"I have tried to be different from the other orchestra leaders and in doing so I have chosen a style that demands the most exacting care of my health. You can imagine what kind of a half-hearted flop I'd be if I wasn't full of the well-known 'wim, wigor and witality' every minute of the day and night.

"But in chosing a brand of milk, like chosing anything else of importance, one must be very careful. Milk from tuberculin tested cows is the only safe bet."

* * *

NEW BABIES—BRIDES—NEW RESIDENTS.

(Continued from page 39)

"Forgetting to call for bottles is one of the most common, and most costly oversights made by milk dealers. Each bottle represents an investment greater than the profit on the bottle of milk. To lose the bottle means a loss of more than the profit. For that reason we watch the bottles sent out to dealers and to organizations purchasing their dairy supplies from us.

"Just as we did in the case of the lodge, we charge each dealer for the bottles we deliver to him and credit his account with the bottles returned. For instance, if our deliveryman leaves two dozen quarts of milk, the dealer must give him two dozen empty bottles, or he is charged for the difference.

"After our milk or cream has been delivered to a dealer, we accept no returns. This is also true in our sales to organizations. Every sale is final. Sour milk is absolutely worthless to us. So we have advised dealers to buy only as much milk and cream as they can sell. After they have ordered the milk and it has been delivered to them, it is theirs. They have bought it and are expected to pay for it.

"We make our deliverymen personally responsible for the credit of our customers. This has cut down the losses from bad accounts. Before a deliveryman fills the order of a new customer, he personally investigates his credit. The local association of commerce has a bureau devoted to getting and supplying this information. We do not solicit or want the business of persons of doubtful credit."

WASHINGTON — MAINE

Notes From Far and Near

CALIFORNIA — FLORIDA

Owensboro, Ky.—A recent survey showed that 600 Carlisle county farmers are selling milk or cream. This is an increase of 1,000 per cent in four years, according to County Agent L. C. Pace.

Long Branch, N. J.—M. McCue Dairy has installed a can washer and drier. Thomas McCue is the manager of the plant, succeeding his brother Martin, Jr.

Cortland, Ill.—Brown & Frey, Inc., a newly organized concern, manufacture and deal in dairy products, food products, poultry, produce, etc. The incorporators are Roy E. Brown, Reuben Frey, Martha Brown and Grace M. Frey. The correspondent is Smith & Brewer, First National Bank Bldg., Sycamore.

Douglas, Wyo.—Converse county ranks second in the state in dairying, being excelled by Laramie county.

South River, N. J.—The Allgair Milk and Cream Co. have installed a large glass-lined storage tank for milk.

Lansing, Mich.—Plans for construction of new units to the Lansing Dairy Company's plant, at 518 N. Cedar St., were announced by H. C. Hansen, general manager of the company. The new unit will be built on property adjoining the northern line of the present dairy. The plans call for a one-story brick building 56 feet wide, by 62 feet long.

Helena, Mont.—James McHugh, well known dairyman in Helena and vicinity, passed away at a local hospital on Aug. 25th, at the age of 72.

Ames, Ia.—Contracts for the erection and equipping of the new dairy building at Iowa State College, at an estimated cost of $100,000, have been let and construction will be begun within a few days.

Columbia, Miss.—The Oaklawn Dairy, of which Allen Simmons is the proprietor, it is reported, will erect a dairy barn, sanitary milk house and install equipment to sterilize bottles, utensils, etc.

El Dorado, Ark.—The John Dairy Company, Inc., has a capital of $30,000. The incorporators are W. B. Johnson, P. Weber and L. B. Smead.

Malone, N. Y.—New speed records in the building and equipment of milk plants are now being made in Clinton and Essex counties, where plants of the Dairymen's League Co-operative Association are being constructed. A. J. Vroman is chief of the League's engineering department.

Longview, Tex.—According to J. E. Stanford, agricultural director of the East Texas chamber of commerce, plans have been perfected for the Texas exhibit at the National Dairy Show, which will be held in Memphis, Tenn., in connection with the Tri-State Fair to be held there in October.

Burlington, N. J.—J. M. Allen is remodeling his plant on Juniper Street preparatory to the installation of a pasteurizing plant.

Fremont, O.—C. E. Blackman, for the past two years manager and owner of the City Dairy, announced that the big plant on North Clover Street is closed. Mr. Blackman will continue to operate a milk route, however.

Mackay, Idaho.—Four years ago Andrew Hintze, and his brother Melvin, started in the dairy business near Mackay, on a very small scale. Today their gross income in $650 per month, of which they get $450 from their own cows. The Lost River Valley, in which they are located, presents many good opportunities for successful dairying.

Squankum, N. J.—W. VanSchoick has just completed a new pasteurizing plant with all new equipment.

Middlesex Borough, N. J.—Maple Lawn Dairy have just placed a new filler and capper in their plant, and have also installed a large glass-lined storage tank for milk.

Norwalk, O.—By November 1st of this year the Wisconsin Food Products Ohio Company will be using more than 25,000 pounds of milk per day, for which they will pay the farmers of this community more than $600 a day. The Kiwanis Club of this city is responsible for the locating of this plant in this city.

Bradenton, Fla.—S. V. Harris has been elected president of the Manatee County Dairymen's Association, with H. C. Slaughter as vice-president; L. P. Wilson, secretary-treasurer, and E. L. Ayers as representatives on the board of directors of the state association.

Port Huron, Mich.—Sanitation is one of the most vital points being stressed at the North Side Dairy, 2329 Tenth Ave., of which W. Grierson is the proprietor. The dairy is equipped with the latest sanitary devices and with the latest production machinery.

Macon, Ga.—Organization of the Dairy Products Manufacturers of the state of Georgia to bring skilled leadership and co-ordination into the infant dairy products industry of the state was perfected at a meeting of manufacturers from all parts of the state. The new association, for which petition for charter was filed in Fulton County after a preliminary meeting in Atlanta two weeks ago, comprises the principal consumers of milk and cream in Georgia organized into three autonomous divisions, ice cream, bottled milk distributors, and butter and cheese manufacturers. H. C. Antrim and J. D. Kinnett are the president and treasurer of the organization.

Hialeah, Fla.—This town is to have a new dairy, work already having been started on it. It is located at Thirty-third Street and the Seaboard tracks. It is expected to be in operation about the middle of September. Rudolph Anderson is the owner.

Phoenix, Ariz.—The plant of the Mesa Dairy & Ice Co will be rebuilt this fall, at a cost of $100,000.

Davenport, Ia.—It has been announced that Walter and Lawrence Strayer of Rock Island have taken over the management of the Co-operative Dairy Co. and have agreed to put it on a paying basis.

Granite City, Ill.—Fire of undetermined origin destroyed several of the George Marko dairy buildings at an early hour causing damage totaling about $7,000. The loss is partially covered by insurance.

Asbury, Park, N. J.—W. R. Sickles of 1100 Sunset Avenue has now arranged to buy his milk on a butterfat basis.

Newark, N. J.—The L. W. Robbins Co. has made an announcement to the effect that it has affiliated with the Philadelphia Dairy Products Corp., a subsidiary of the United States Dairy Products Corp.

Youngstown, O.—The $50,000 plant of the Warren Sanitary Milk Co. is completed. The company is headed by B. A Millik of Youngstown, S. L. Stauffer, H. W. Tisher and E W. Patton.

Lafayette, Ind.—Elmer Mennen, Inc., has a capital stock of $25,000. It is the object of this concern to deal in milk

COUNT 'EM ACCURATELY—BOTTLE or CASE

PRODUCTIMETER
Conveyor Counter

Productimeters recording daily volume on important machines or operations give you an accurate count, in plain figures, quickly and dependably. They tell you at a glance just what has been done in a given period of time; make it easy to figure costs, bottle and case requirements, etc.

Built in various models—to fit washing, filling, sealing machines, conveyors, and to tally bottles, cases, packages, boxes. Our Service Department advises you which model is best for particular applications. Write for the Productimeter Catalog, telling us what you wish to count.

and cream and other dairy products. The incorporators are Elmer Mennen, Charles W. Brand and Lula G. Mennen.

Grand Rapids, Mich.—The Furniture City has been selected for the 1928 convention of the Michigan Allied Dairy Association, according to D. W. Shiel of Hillsdale, secretary of the association. It is expected about 300 dairymen will attend the convention which will be held here the week of February 6th.

Montague, Mich.—Ernest Meyers has filed papers to do business in Muskegon County as the White Lake Dairy.

Pontiac, Mich.—The new Saginaw Street building, constructed by the Home Dairy Company of Flint and Saginaw, will be ready for opening early in November.

Covington, Ky.—The need for greater space to carry on its increased business was answered by the John W. Ladd Company, dealers in dairy machinery, when it took a ten-year lease on the five-story structure at 128 West Third Street.

Croswell, Mich.—The Jersey Farm Dairy Co. of Detroit is planning to erect a building here which will be 30 x 160 feet in size. Machinery will be installed for cooling milk to be taken to Detroit and a plant for pasteurizing the milk will also be added. The plant will also contain the necessary machinery for making cottage cheese.

Paris, Ky.—Mr. and Mrs. W. Willians, of Paris, have sold their dairy business to James Clough, who will continue the business.

Brooklyn, Wis.—The first of a number of local chapters of the Pure Milk Association, dairy producers' organization of the Chicago, Ill., district, was formed here recently, with Park Ames as president. The new association has for its object the organization of farmers producing milk for the Chicago market, and is similar to organizations already existing near the larger market centers. Verne Ellis was chosen treasurer of the Brooklyn chapter, and Harry Hook, secretary.

Aberdeen, Wash.—Work on the new $50,000 Sanitary Dairy at 414 West Wishkah is nearing completion with the date for its opening set for about September 1, according to John Novaselich, general manager of the establishment. The most modern equipment available will be used in the plant and no expense will be spared to make the conditions absolutely sanitary, Mr. Novaselich said. The company is incorporated for $77,000.

Los Angeles, Cal.—According to a survey and milk scoring contest just completed by representatives of the Bureau of Dairy Control, Los Angeles is blessed with a milk supply of high quality. A rating of 95.5 per cent, given the supply as a result of the tests, was 2 per cent higher than that awarded after the last contest.

Sacramento, Cal.—The reorganization of the Sacramento Grade A Milk Producers was recently completed, with A. Marty elected president. The association includes producers in Sacramento, Yuba, Sutter and Yolo Counties, the region from which Sacramento draws most of its milk. The other officers chosen are George Bryte, secretary, and F. L. Giffen, manager.

Beaumont, Cal.—Beaumont is the home of the Armstrong Dairy, a well-known institution in Riverside County. J. C. Armstrong, the owner, is accomplishing much in building up his Guernsey herd along certain blood lines.

Bartow, Fla.—The dairy men of Polk County, including distributors of dairy products, recently met for the purpose of perfecting the organization of the Polk County Dairymen's Association.

Blytheville, Ark.—Citizens of Ekron, Lone Oak and Half Moon, held a meeting in the interest of dairying. The committee from the chamber of commerce here explained plans of the live stock finance corporation to have more cows brought and placed in this section.

Hamilton, O.—According to Dr. Fleming, of the health department, "The people of Hamilton need not fear the milk here, because the local plants are co-operating with the health department in safeguarding the public."

Madison, Wis.—A crowd estimated at nearly 500 attended the annual picnic of the Madison Milk Producers' Association at Olin Park on September 2. Races, games and dancing were features of the program.

Cleveland, O.—The Horten Dairy Co. has been incorporated with a capital stock of $25,000 to manufacture dairy products. Hubert Horten, John Horten and C. W. Horten are the incorporators.

Bridgeport, Conn.—The Mitchell Dairy Co. has purchased the dairy of Mr. Shay here. Mr. Shay will be in the employ of the company for the coming year.

St. Louis, Mo.—The National Dairy Show Association, of which V. A. Vesper is the chairman, is contemplating the erection of a civic center building at an approximate cost of $500,000.

Chicago, Ill.—The Morrisania Dairy Co. has advised that an architect is drawing plans for the erection of a pasteurizing and bottling plant to be erected at Yonkers Avenue and Prescott Street, this city. It will be a two story brick building and will cost approximately $45,000.

Danville, Ill.—The controlling interest of the Blue Banner Dairy, at Fairchild and Robinson Streets, has been sold to three Chicago men. Mr. Lumbrick, formerly owner of the dairy, will remain with the company temporarily.

Madera, Calif.—Marshall Holland, former Fresno milk distributor, has purchased the retail routes and milk distributing business known as the Quality Dairy and owned by W. R. Ennis.

Whittier, Cal.—The Whittier Sanitary Dairy recently sent a caravan consisting of fourteen delivery trucks with the drivers to the Downey Fair, where they took part in the parade which is held each year by exhibitors at the fair. The trucks were appropriately decorated.

Williamson, W. Va.—A large warehouse and a distributing plant is to be erected in the immediate future by the Dairy Products Co. who are also operators of the LeRoy Dairy in that city. The building will provide modern facilities for the business for which it is intended, and will have an exterior of white glazed brick. The new plant when completed will be one of the best of its kind in the state. Charles LeRoy of Williamson is the owner and J. C. Bolden is the Logan manager.

Red Bluff, Calif.—C. L. Eustis, Guernsey breeder, of Los Molinos, and Peter Vonah, of the Western Dairy, are eligible for the award offered by the National Dairy Association. This award is in the form of a certificate with the seal of the association on it, stating that each of the herds has an average of more than three hundred pounds and is given in commendation for achievement in this line.

Chillicothe, O.—Secretary W. A. Wentworth of the Ohio Dairy Products Association, gave an address before the Rotary Club in which he told how the milk industry has developed during the last few years. Mr. Wentworth said that the value of the dairy industry to the farmers during the last year was $2,900,000,000. This, he said, is more than the value of hogs and cattle combined, and is also more than that of corn and wheat combined.

Seattle, Wash.—A 50 x 100 addition to the Royal Dairy will be started immediately next to the present plant on Leary Avenue, it was announced by C. R. Schain, president and general manager of the company. "We figure that it

American Engineering Company
2417 Aramingo Ave., Philadelphia, Pa.

will take about six weeks to complete this work," said Mr. Schain yesterday. "It will be of concrete and has been made necessary by the constant growth of our milk business."

Wilmington, Del.—The American Dairies, Inc., will conduct a general dairy business here. The concern is incorporated with 5,000 shares of no par value stock.

Streator, Ill.—The Streator Milk Co., Inc., is located at 126 S. Park Street. This concern will deal in dairy products of all kinds, and is capitalized at $15,000. The incorporators are Jett Mason, A. J. Burt, George J. Wallis. Correspondent: Jones, Essington & Heflin, 222 Murray Bldg., Streator.

Tuscumbia, Ala.—The Colbert County Milk Men's Association, a co-operative organization of dairymen of Colbert County, has been organized here following a membership meeting at the Courthouse in this city. Organization of the association was for the purpose of enabling the dairymen to join in the purchase of feed and for the general betterment of dairying conditions in this county.

Lexington, Miss.—Business men of this city have employed C. J. Goodell, graduate of Purdue University and an instructor at the Mississippi A. & M. College, for the promotion of the dairy industry in this section. At the present time his efforts will have to be directed toward the elimination of the cattle tick.

Tampa, Fla.—The new city dairy code which has been in effect just a few days more than a month has already proved a success, according to E. C. Levy, chief health officer. The supply of milk has not only improved but the people are gradually giving dairymen and distributors great patronage because of the heightened faith in the quality of the product demanded by provisions of the municipal law.

Huntington, Ore.—Contractors and carpenters are now at work on the erection of what is believed will be the most modern and up-to-date dairy barn in eastern Oregon. The plans call for a concrete structure 40 by 120 feet in dimensions, eight and one-half feet high, with concrete floors, mangers and sewer system. The second story will be of lumber and will hold 125 tons of hay. The roof is to be fashioned after plans known as "hip roof" and the entire height of the building will be 31 feet.

Kenosha, Wis.—The Guernsey Co-operative Milk Co. is one of the best known dairy organizations in the city. It was established a few years ago and has grown rapidly and now has a modern plant in which sanitation is carefully watched. The company is officered as follows: Walter S. Dexter, president; Charles H. Curtiss, vice-president; John Halloway, secretary and treasurer; Carl M. Reed, general manager.

New York, N. Y.—Dr. Louis I. Harris, commissioner of health of New York City, has the interests of the public at heart. He said: "I have no intention of getting milk from impossible distances. Any milk that comes into New York without being properly inspected and passed upon by our own inspectors is out of the question," he continued. "Any one that knows the situation at all knows that a perishable article cannot be brought safely from considerable distances."

Ocala, Fla.—The South Marion and North Marion Dairy Associations met at Lowell the latter part of August for an all-day picnic. County Agent C. R. Hiatt was chairman of all arrangements.

Norwalk, Calif.—Just west of this city is situated the home of the El Colmo Rancho, one of the most up-to-date dairy ranches in southern California, with its famous prize-winning breeds of cattle. The milk produced and bottled there is distributed by the Whittier Sanitary Dairy Co. of 130 S. Comstock Ave., Whittier, which company owns and operates a very modern creamery.

Owatonna, Minn.—Owatonna today has as splendid a pasteurization plant for its size as can be found in Minnesota, with the completion of the modern and ultra-sanitary Owatonna Dairy Co. plant at Winona and North Cedar Sts., under the managmeent of H. R. Bierman.

Albany, N. Y.—A milk producers' advisory board has been formed here, according to P. G. Ten Eyck. "The orderly marketing of the milk supply of the greater New York City milkshed," said Mr. Ten Eyck, "requires that the advisory board be established to eliminate economic waste, establish uniform sales practices and to guarantee an adequate supply of pure milk to consumers."

Bartow, Fla.—The State Council of Home Demonstration Clubs at its annual meeting adopted its program of work for the coming year. One of the main objectives for the coming year of the clubs is to obtain a better milk supply and assist in the efforts to increase the use of milk.

Kendallville, Ind.—Kendallville's new industry, the whole milk plant being constructed off South Main St., will be ready for operation the last Friday of September or the first Friday in October, which announcement was made at a stockholders' meeting. Don Hudson of Ligonier will be manager of the local plant. Directors elected were E. M. Sherman, George Harvey, B. F. Haines, J. W. Harvey, H. G. Eshelman, Morton Wible, John Schermerhorn, John Mertz and I. O. Reinoehl. The directors elected the following officers: John Schermerhorn, president; George Harvey, vice-president; J. W. Mertz, secretary; Glen Thrapp, treasurer and counselor. The executive board will be appointed later.

Chula Vista, Calif.—Fred Walton is the owner and operator of the newly organized Orange Blossom Dairy which recently received a permit to operate as a dairy.

Mt. Sterling, Ky.—James Scott, one of the owners of the Jersey Milk Co., has sold his interest to Miss Nannie Owings and Richmond D. Turley. It is proposed to greatly enlarge the plant enabling it to handle nearly all of the milk and cream produced in the county at a price in excess to that paid by outside concerns. The company will continue to deal in pasteurized milk, creamery butter, ice cream, ices, fresh cream and other dairy products.

Portland, Mich.—Chester Devine is making improvements on his dairy farm north of town. A large garage and milk room is being built, 24 by 50 feet, and the buildings are all being repainted.

Decatur, Ill.—Formal opening of the Union Dairy Products Co. new building was held on Labor Day. The new building is located at 304 South Main St.

Chicago, Ill.—The Douglas Dairy Co., 2254 S. Troy St., has purchased the dairy formerly belonging to John Kilmek at 5324 S. Lockwood Ave.

Hollywood, Fla.—Florida Dairy Products, Inc., has changed its name to Dolly Dimple Dairies, Inc.

Jefferson, Ga.—The large dairy barn of T. W. Murphy & Sons at Talmo was burned to the ground. Some insurance was carried on the barn, but none on the contents. Twelve cows perished in the flames.

Jacksonville, Fla.—Opening of a large new dairy plant at West Palm Beach, known as the Dixie Dairies, Inc., and owned and operated exclusively by local men, has been announced. The company has opened offices in the Lakeview Arcade, West Palm Beach. Dr. E. D. Clawson, former health officer of that city, is president and general manager.

South Bend, Ind.—R. S. Stutzman was chairman of the program committee at the annual banquet held on September 8 at the College Inn by the South Bend-Mishawaka Milk Dealers' Bottle Exchange.

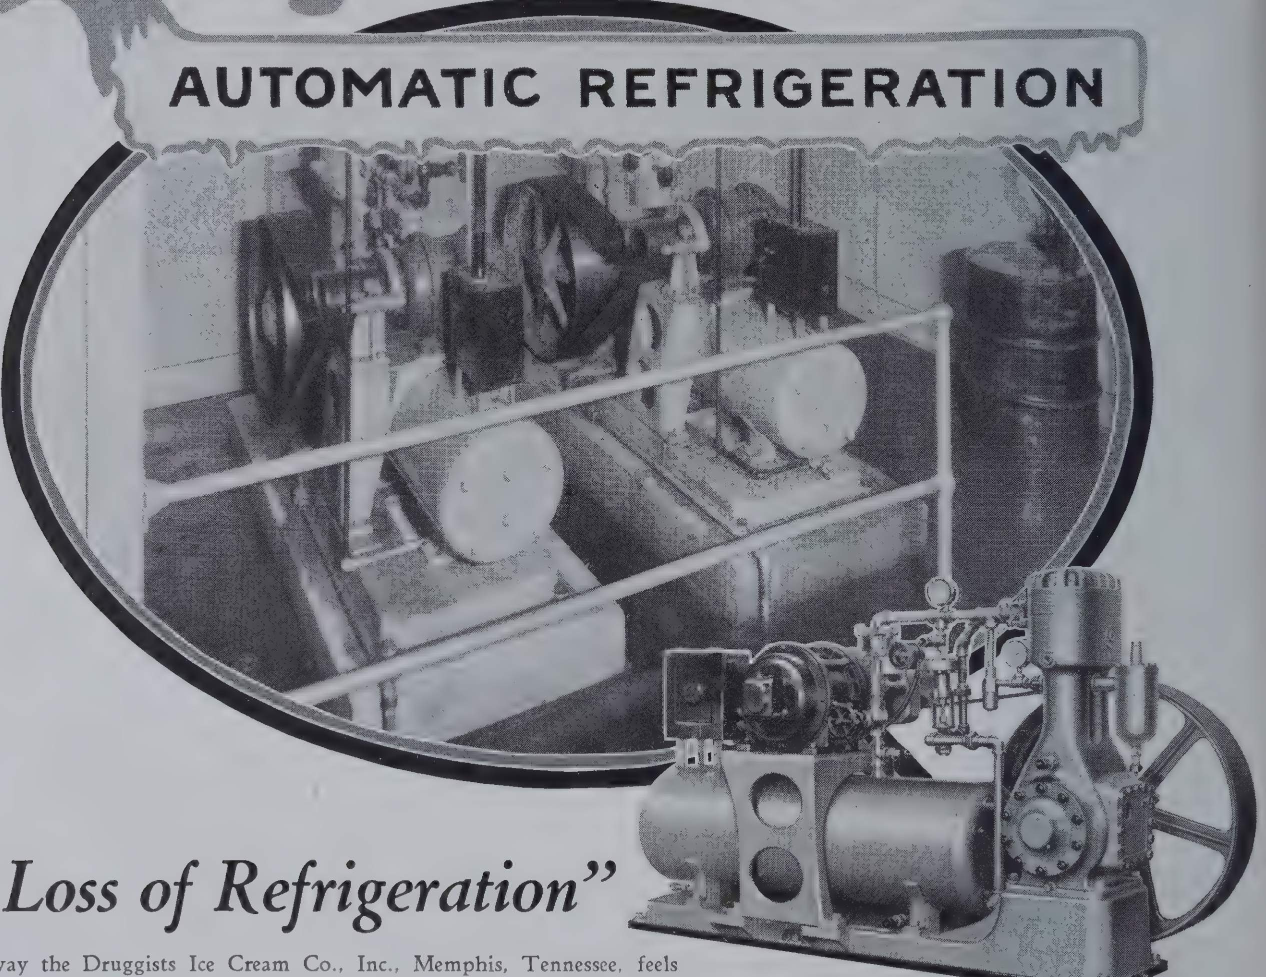
Lipman

AUTOMATIC REFRIGERATION



"No Loss of Refrigeration"

That's the way the Druggists Ice Cream Co., Inc., Memphis, Tennessee, feels about the two Lipman Model 1010s that give it—

Electric Refrigeration

". . . .we are delighted with the operation of the Lipman Ice Cream Plant you designed and installed for us.

"We are certainly pleased with the way the plant is working, especially the twin Model Lipman 1010s, one of which handles the hardening rooms, with a capacity of 2000 gallons daily, automatically, and the other for ice cream making.

"The refrigerating machines require little or no attention, and are ever ready to serve us on any special orders that may come into our plant.

"Due to the design of these machines, there is practically no loss of refrigeration, hence the cost of operation is cut to a minimum.

"We cheerfully recommend the Lipman Full-Automatic for silent operation, economy, and durability."

Note the compactness of the Twin Lipman installation shown above. Ruggedness and unfailing performance make Lipman machines a profitable investment for dairies, ice cream plants, bottling works, and all places where steady, economical service is an essential. Write us for details—or inquire of your local Lipman Distributor.

COWS TO BLAME FOR "PULPY" OR "PASTEBOARDY" FLAVORS.

Storrs, Conn.

Editor The Milk Dealer:

I have read with a great deal of interest the article on "pulpy" milk by Sobey Okuyama in the August number of "The Milk Dealer."

At the Storrs Experiment Station we have been watching for a solution of this problem for some time. Several years ago there was an outbreak of so-called "pasteboardy" milk in the college herd. After samples had been taken from individual cows, the cause of the flavor was attributed to a cow in the herd.

Each year thereafter, particularly in the fall, we have had outbreaks of "pulpy" or as we call it "pasteboardy" milk. In following up the cause of the flavor we checked up every point in the progress of the milk from the cow to bottle. We eliminated all sources such as feed, utensils, pouring tank, pipe lines, cooler, bottling machine and bottles. We find that our sources of "pasteboardy" milk is from the cows.

At the present time we are taking samples weekly from the herd to ascertain which cows are giving the off-flavored milk. Samples are taken into sterile 50-c.c. wide mouth glass bottles. Sometimes the flavor is present in the fresh milk and its intensity increases with age. With other samples of milk from individual cows, the "pasteboardy" flavor develops on standing for 24 hours at 35 degrees F.

We are still working on the cause of "pasteboardy" flavor.

Very truly yours,
E. O. ANDERSON,
Ass't Prof. Dairy Husbandry,
Conn. Agricultural College.

CHICAGO HEALTH DEPARTMENT WILL HAVE CLEAN MILK AND CREAM.

Hereafter, farmers in and around De Pere, Wis., who ship cream and milk to Chicago, and other Illinois markets, must adhere to more stringent rules governing the handling of milk and cream, which rules were laid down by the Chicago Health Department.

In general the rules require the building of sanitary milk houses on dairy farms, and the establishment of sanitary conditions in cattle barns. Cream and milk is accepted only when coming from tuberculin tested herds. This latter requirement is not a new one, however.

A representative of the Chicago Health Department is making a survey of the farmers and dairymen, acquainting them with the requirements necessary under which they will be acceptable in the Chicago market.

Barns should have cement floors, stanchions and litter-carriers, and the interior whitewashed and kept in a clean condition. Relative to milk houses, they must be sheeted on the outside and finished with wood or plaster in the inside, and must contain concrete tanks. Windows must be screened. Milk should be cooled to 55 degrees before delivered to the creameries. Metal coolers are barred for cooling milk.

Many of the dairymen have the necessary equipment and are producing milk under the sanitary conditions required, but some will have to make necessary improvements.

William Puts It Over

One of Our Readers Solves the Problem of What to Do With the Kids While He and Friend Wife Go to the World's Dairy Congress Next Spring

"NOW, William," says the wife sharply as I swung into the driveway of my sister's farm, "don't drive so fast or you'll run over Amelia's chickens. There's no use in getting her mad before we start talking to her."

"Alright, my dear," I comes back politely. "But remember what I told you about not sayin' much while I'm doin' the talkin'. I know how to handle Amelia so's she will be glad to keep little Oscar and Gordon while we're gone to Europe. And remember also that if one of your children starts a rumpus so that Amelia gets the idea that they are kinda tough kids, there's two whalings in sight." I slows down and turns my head backwards. "Do you hear that?"

"Yes, papa," chimes the kids sweetly. "We love our Aunt Amelia, don't we, mamma?"

"Some coach you are," I says to the wife. "But don't let 'em put it on too thick. And for goodness sake, keep them out of trouble."

The wife gives out a caustic "huh." "You talk like they wasn't your children at all. Who's to blame if they go about making all the pigs squeal, and chasing the ducks around till they think they're wild geese?"

I had a real snappy answer framed, but just then I pulls up in front of the house and unloads the family to pay our respects to Sister Amelia.

Amelia was washing the supper dishes as we comes in real cordial, and after passin' a couple of "how-do's" back and forth, and doin' a little regulation handshakin', I sees my wife put on an apron and dig in helpin' with the dishes. Women are that way, you know.

"Well!" says Amelia in that screechy voice of hers which got that way callin' my younger brother Henry to get up in the morning. "You ain't been out for a long time."

I glances at the wife meaning for her to keep still and says real nice back to her: "No, Amelia, we ain't. But the children have been asking about you so much, and how was the farm and the chickens, and everything, that we figured it would be a good thing to bring 'em out to see their Aunt Amelia." I smiles kinda brotherly at that one, waiting to see how she'd fall for it.

"Well!" Amelia says non-commital like; and then turning to Elsie, who was helping her dry the dishes, she says: "Maybe you could tell me what you come out for. He," she continues, pointing at me, "has got a slick tongue. Is that children stuff all right for me to fall for? I never know just what to believe when—"

"Now Amelia, that ain't no way for a sister to speak," I says, makin' out like my feelin's were hurt.

"Well, anyway," she says, puttin' away the last of the dishes which were almost all done anyway when we came, "I don't often believe what a man says—not even Sim sometimes." Then she looks at me with a fishy eye. "Where's the children? Didn't you bring 'em along?"

The children! I looked around, not knowin' what to say, hopin' at the same time they weren't in any mischief. "Oh," I says finally, "I guess they're outside playing."

"Playing?" she laughs kinda funny. "You mean wrecking things!"

"Now Amelia, you know the kids is nice. In fact you ought to have a little boy of your own like Gordon or Oscar."

My wife throws a funny look at me, but I pays no attention because I could see that Amelia was sorta took by what I said.

"Well, maybe," she admits, "but kids is a lot of trouble." Then addressing Elsie, she says: "Anyway you could tell me why you come out, and what is the news."

I winks at the wife to keep quiet, but she beams a broad smile and busts out: "William and me is going to Europe next spring!"

"So!" replies Amelia. "I thought it must be something important."

"And we was just wondering Amelia," she keeps on, "if you would take care of Gordon and Oscar while we were gone."

"So!" Amelia announces crisp-like. "You could maybe have said that in the first place."

"Now, listen, Sis," I says, callin' her that to make it sound more brotherly, "the kids ain't had any real fresh air and sunshine for a long time. It would do them a lot of good to be out here for a while with you—"

"Hey!" Sim's voice came bawling out to us through the open door. Hey, William! Come out and git your danged kids outa the water trough!"

Amelia smiles like to say, "I told you so," but I jumps up quick, runs outside and pulls the youngsters out of the water. And after having done my duty as a father should do, with Sim lookin' on and laughin', I comes back to the house, slappin' my wet knees.

"As I was sayin', Amelia," I starts right in as if nothin' had happened, "kids really ought to learn something about—"

"They ought to learn something," Amelia puts in. "They sure ought. But no kids for me, William. I ran my legs off last year trying to keep track of them."

"Of course," I admits, "kids has got to have some fun out of life—"

"Yeh—but they don't have to tear up the place when my back's turned."

"Tush," I says, disbelievin', "Oscar and Gordon is well trained. Ain't they ma?" Elsie just nods and keeps quiet like I told her to. So I says: "But I ain't explained what all the grand racket is about."

"You can explain if you want to," Amelia says, as though she's not interested at all. "But it won't do any good."

"Now Sis," I replies, "you ain't so hard hearted as all that. Well, anyway, next spring there's goin' to be a World's Dairy Congress in London, England. And after the congress there's going to be a tour of Europe. Elsie and me is goin', but we can't take the kids."

"They'd probably sink the ship if you did take them," observes Amelia.

"So Elsie and me wants to know can we park 'em with you for about six weeks?"

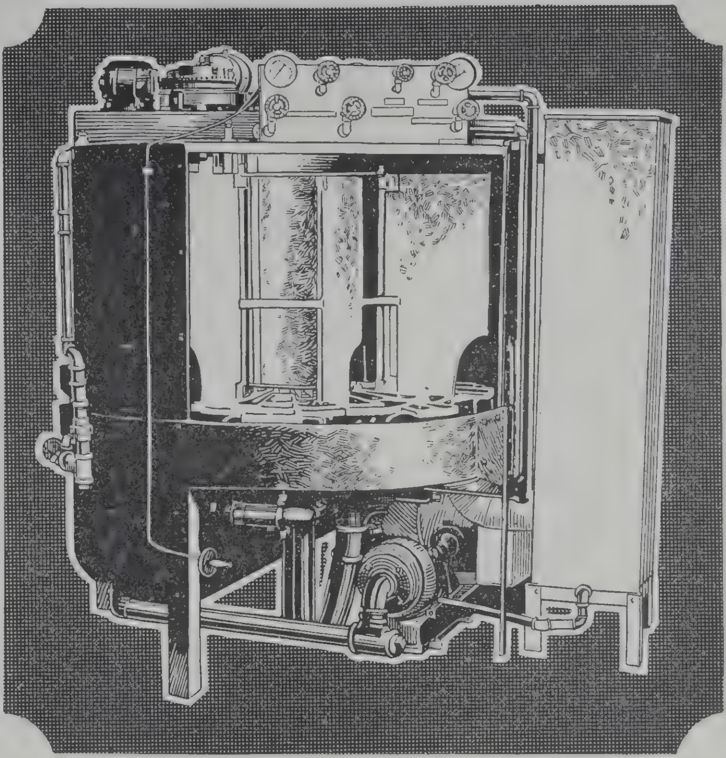
"No. I ain't no garage."

"But listen Sis," I begins all over again, dropping my voice a bit. "Elsie was just saying how she was thinking of bringing you a nice dress from Paris, and maybe one of those spiffy French hats. Of course you know that we wouldn't want you to do us any big favor without payin'—"

"It ain't the money, William. It's the bother. Your

Barber Goodhue
Everything for the Dairy Industry

The R & A Intermittent Rotary Can Washer



MANY voluntary expressions of satisfaction with the R & A Rotary Can Washer come to us regularly from creameries, milk plants and ice cream factories. Wonderfully efficient, durable, economical in upkeep. Delivers a steady stream of absolutely clean, sterilized, dry cans and covers, day after day for years.

Intermittent operation — entirely automatic. Operator simply loads cans and covers. They are carried through machine automatically, stopping for just the right period over each jet. The process is so positive, it can't help producing perfectly uniform cleanliness in every can and cover.

If you want utmost efficiency, durability, speedy performance and satisfaction you can't select a better, more dependable machine than the R & A Rotary—*regardless of how much you pay for it.* Capacities from 120 to 600 cans per hour.

Write us now for detailed specifications and prices.

kids is always getting into mischief. But maybe I could think it over."

"I got to know right away," I insists, "because reservations must be in the quicker the better or Elsie and me got to sleep in the boiler room where it's hot if you know anything about boilers. Mr. Olsen just wrote me a letter the other day and says: 'Hurry up, William, if you are coming. Reservations is goin' fast, and we'll have to put you in a hammock unless you git a movin'.' And I, for one, don't want to sleep in no hammock. Do you, ma?"

Just then the kids comes in all wet and dirty from head to foot. They stop on the edge of the doorway, and then both of them chirp out at once: "We love our Aunt Amelia," and each goes over to her and kisses her.

"Such dirty little boys you are," says Sis. "Elsie, why don't you train 'em better so's they keep clean at least?"

"We love our Aunt Amelia," says the kids again like they was recitin' poetry.

"You little dears," Amelia says to them with a motherly smile, puttin' her arms around each one after the other. "So you want to come and visit your Aunt Amelia next summer."

They nods their heads up and down.

"Sure you can come." Then turning to Elsie she says: "What was you sayin' about a Paris dress?"

That fixed it. Later, as I was packing the kids in the car and we were driving away, I says to the wife: "See how easy I worked it?"

"You worked it?" she asks, madder than a wet hen. "Who was it that coached the kids what to say? All you did was to make Amelia sore. Do you think she'd fall for your line of chatter? I fixed it for you, and don't forget it. And then you had the nerve all along to ask me to keep quiet. Huh!"

That ended the conversation, and I just kept on driving and sayin' nothin'. And soon as we got home, I wrote out a wire pronto and sent it to Mr. Olsen tellin' him that everything was K. O. and that we'd be on deck with him when the old boat got ready to toot-toot. So far as I know there is nothin' else to interfere with our trip. But you can never tell about women.

EDITOR'S NOTE—The Mr. Olsen referred to by William is Mr. H. P. Olsen, president of The Olsen Publishing Company, Milwaukee. This company is sponsoring the only official tour to the World's Dairy Congress next year and reservations for passage and trips, etc., are being booked. Join the leaders and send in your reservation now. Full information will be gladly sent to you by The Olsen Publishing Company, 501-515 Cherry St., Milwaukee, Wis.

MILK IN THE FACTORY.

At the Wisconsin State Fair the Gisholt Machine Co., Madison, Wisconsin, featured a pyramid of milk bottles in their booth in Machinery Hall. They have no direct interest in promoting the dairy business, except as an increased use of milk by their employees increases plant efficiency. At least they believe such is the case, and who is in a better position to judge?

"Milk in the Factory" is the slogan of a campaign sponsored by the Wisconsin Manufacturers' Association.

MILK IN THE FACTORY

In the Gisholt exhibit we found several attractive placards, one of which read as follows:

GISHOLT MACHINE CO. USES
600 PINTS DAILY.

Gisholt is one of 22 Wisconsin companies whose employees, while at work, consume a total of 2,900,000 pints of milk each year. Value, $150,000.

This in addition to home consumption.

There is an interesting story in connection with Gisholt's use of milk which comes to us from an authoritative source. When the officials were first approached by the milk interests they laughed at the idea of serving milk to their employees. Finally, they were prevailed upon to give it a trial and this exhibit, in which they spent a lot of money to show their loyalty to milk, is the result.

SENTIMENT IN FAVOR OF PASTEURIZATION OF ALL MILK, INCLUDING CERTIFIED.

Although no official effort has been made to compel, by city ordinance, the pasteurization of all milk sold in Dayton, Ohio, yet there is developing strong sentiment in favor of pasteurization of all milk, including certified milk, according to expressions of opinions made at a meeting of milk distributors of southwestern Ohio recently.

Health Commissioner Peters said that frequent inquiries are made of the division of health as to means of preventing a dishonest distributor from adding raw milk to the pasteurized.

"There is a personal element in all business depending entirely on the honestly of the firm or individual," said Dr. Peters, in answer to the inquiries. "To check every drop of milk sent into Dayton," he continued, "would entail prohibitive cost of inspection. A general check is kept by inspectors here who make frequent examinations of plants, equipment and methods. All pasteurizing equipment must be modern in every respect and must be equipped with time and temperature recording apparatus. It is unwise to buy milk or any other commodity from a dealer whose honesty you may question."

⁂

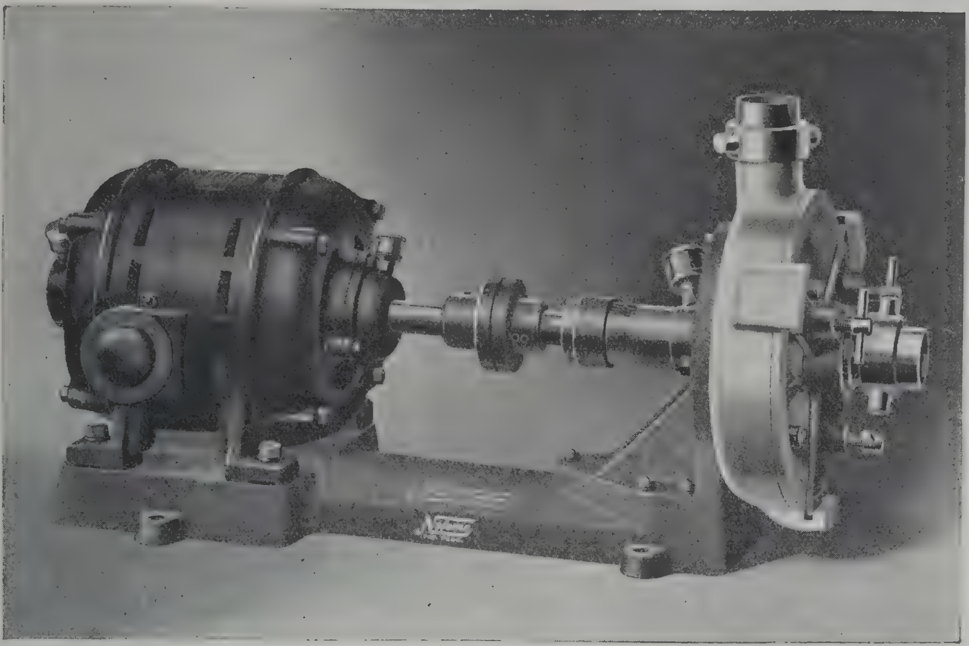
MILK BOTTLE WINS RACE WITH LETTER IN OHIO DELIVERY DERBY.

H. D. Eckert, a director of the Scioto Valley Milk Producers' Co-operative Association, Columbus, O., recently made a comparison of modern milk delivery and mail delivery.

In making this comparison Mr. Eckert used actual experience. He has relatives living on a farm 50 miles from Columbus. He found that if a can of milk were set on the farm platform ready for the milk truck, and a letter dropped into the rural mail box at the same time, that the milk would be transported to Columbus, pasteurized, bottled and delivered to the doorstep of the consumer several hours before the letter would reach a city resident by carrier.

Looking for New Equipment? Read the Advertisements.

Nofome Sanitary Milk Pump



No churning, because the enclosed impeller carries the milk to full periphial speed without the vanes passing through the milk.

No foam because no air can enter the pump from shaft bearing, nor grease from the same source.

Milk passes through the impeller housing, but the vanes do not pass through the milk, which prevents churning and injury to the cream line.

Let us solve your Pump and Fitting Problems.

Globe Milk Tickets safetyize collections!

SERIALLY numbered milk tickets minimize every danger of loss—through failure to collect from customers on milk delivered or through loss of those collections as made.

More and more progressive distributors are using the ticket method of collection. It places the business to a larger degree on a cash-in-advance basis, regulates credit and is, besides, efficient and economical.

Write for samples and prices on Globe Milk Tickets in standard and special designs.

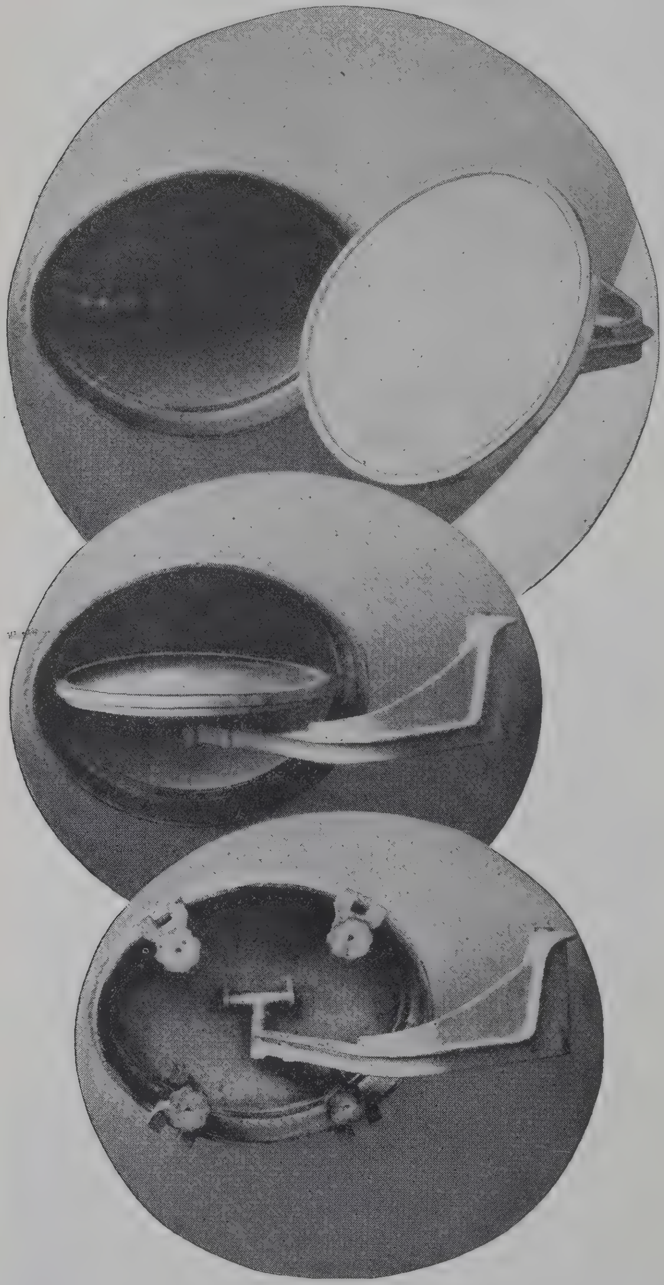
NOTES OF THE TRADE

News of Interest Concerning What Our Readers and Advertisers are Doing to Develop the Industry. We Invite Correspondence Relative to New Products and New Equipment.

NEW INSIDE MANHOLE.

Officials of the Glascote Company, Euclid, O., announce a new inside manhole for all sizes of Glascote horizontal storage tanks.

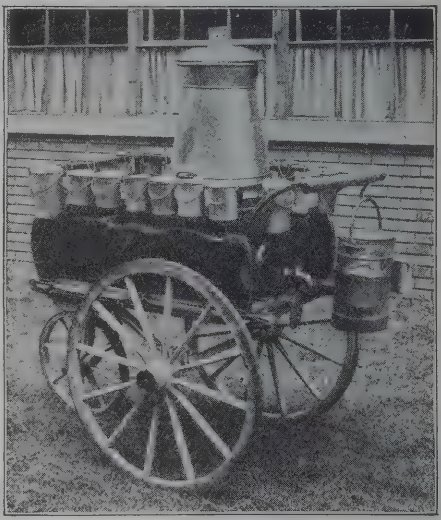
The manhole cover is oval in shape, and is hinged and can be turned so that its smaller diameter passes easily through the larger diameter of the hole, after which it can be turned to the proper position and clamped tight. A pure rubber gasket is permanently fixed to the cover and provides positive protection against leakage. One of the outstanding features of this cover is that it is glass-coated the same as the inside of the tank, thereby providing an interior lining that is completely resistant to corrosion. The new device is now available on all Glascote horizontal storage tanks in capacities from 1,000 to 7,000 gallons. The size of the opening is 15 by 19 inches.



EXPOSITION ATTRACTION IMPORTED.

A curious appearing contrivance for the delivery of milk has been secured from London, England, by the American Dairy Supply Company of Washington, D. C., to be used in conjunction with their exhibit of certified caps at the Dairy Industries Exposition.

Although there are a few dairies in London, including one or two of large size, which employ glass bottles similar to those used in the United States for the bottling of milk, there are still used in the city of London great numbers of small pushcarts, and these obsolete looking affairs contrast so strikingly with the modern methods of milk distribution employed in the United States that the cart to be exhibited is bound to prove of great interest.



The cart is a three - wheeled affair on which is mounted a large brass can, or "churn," holding approximately twenty gallons of milk and topped by a chimney-like cover. Milk is extracted from this container by means of a dipper or through the spigot near the bottom, which extends out from the back of the cart frame. The milk is drawn off into a gallon can, which customarily hangs over a hook on the handle of the cart. From this can milk is taken to the door of each house and measured off with a gill measure into bottles, pans or small metal cans furnished by the housewife. The particular outfit on exhibition at the Dairy Industries Exposition has a supply of twenty-five of these cans, mostly in pint and quart sizes. The cans are made of aluminum or composition metal, with covers fastened by brass hinges. It is a peculiar fact that the milk dealer takes great pride in polishing daily the brass "churn" and the brass work on the small cans, while the other parts of the cans and the cart may be left to accumulate dust, rust—and dents.

Colored post card photographs have been made of the cart, and will gladly be sent to anyone upon request, made at the booth of the American Dairy Supply Company, Spaces 460 and 461, or by mail to the home office in Washington, D. C.

WE ENJOYED OUR VISIT.

It was our pleasure one day recently to thoroughly inspect the mammoth plant of the J. G. Cherry Co., Cedar Rapids, Ia. In company with several other visitors we spent several hours in the different departments where each step in the manufacture of the many items of dairy plant equipment was explained by the plant superintendent. It was a real education in manufacturing efficiency and stock records.

We recalled a visit 28 years previous when the entire investment of the concern was housed in an old red building directly across the tracks from the present wonderful building. A later visit, about ten years ago, also served to remind us of the rapid development that has taken place in building up the firm's business. To see such a business develop in the lifetime of the Cherry brothers—still young men—is an inspiration to any man.

Home of J. G. Cherry Co., Cedar Rapids, Ia.

But what impresses the visitor most is the fact that nothing is left undone to make their products the best that skill and materials can produce. Efficiency is the keynote of plant operation, and a majority of old time employees attests to the harmony and good will that permeates the Cherry organization. Yes, we thoroughly enjoyed our visit.

TELL US ANOTHER!

Officials of The Pfaudler Company who have apparently just listened to a good story. The snapshot was taken in front of the company's Elyria factory. Reading from left to right: W. D. Pheteplace, vice-president and general manager; W. H. Klee, Ohio and Michigan representative; H. S. Calvert, vice-president in charge of Elyria division; O. W. Greene, chief engineer, Elyria division; R. B. Kilmer, general sales manager.

AN EFFECTIVE CLEANSER AND STERILIZER.

Tests made in dairy products laboratories recently have shown that the combined cleanser and sterilizer manufactured by the Klen-O-Cide Company of Chicago is very efficient in cleaning and sterilizing dairy equipment that is usually covered with a film of milk fat. This is accomplished with little apparent harm to the equipment. The product, "Klen-O-Cide," contains a chlorine germicide, which is practically inert so far as the corrosion of metals is concerned. Metallurgical tests in a New York laboratory proved that this cleanser and sterilizer is apparently harmless to metal dairy products plant equipment.

Applied on pure nickel, after soaking in a cold one per cent solution for one week, the metal lost the minute weight of only .007 gram.

Klen-O-Cide is intended for use in hot solutions. Here the best work is done with the combined effectiveness of the cleanser, the chlorine disinfectant, the heat to clean equipment and utensils thoroughly, and reduce the bacteria count to the minimum. The heat increases the germ killing power of the chlorine a great many times.

The directions for the use of the product, as recommended by the manufacturer, provides for use of one ounce to a gallon of hot water, a simple way of sterilizing of the equipment and utensils while they are being washed. It is claimed that the product is a combination of four different cleaning ingredients, together with a chlorine germicide, which is 50 times more powerful in destroying germs than pure carbolic acid.

One ounce is recommended to a gallon of hot water. It does not contain any lye or caustic—is harmless to hands, clothing or equipment, and is non-poisonous. Users of Klen-O-Cide say that it simplifies the care that must be continuously given to dairy equipment to assure good quality dairy products, and the better prices that they bring. This cleanser and sterilizer is manufactured by the Klen-O-Cide Company, 1044 North Latrobe Ave., Chicago.

ALLEN AIR-TURBINE VENTILATOR EXPANDS.

The Allen Air-Turbine Ventilator Co., 1040 14th St., Detroit, Mich., have purchased property adjoining their present plant that more than doubles their capacity. New machinery for die cutting, shearing, riveting, etc., is being installed.

This firm manufactures a ventilator for butter, milk and ice cream plants, and other industrials. It consists of a series of blades, or fans, mounted to form almost a sphere. The blades are so shaped that a little breeze causes the whole ball to rotate, and as it revolves the fan blades on the inside of the ball draw the air up from the rooms below. No other motive power is needed. The whole revolving portion rests ing which supports the whole moving part, as well as the upper bearing, are lubricated by means of the Alemite system of lubrication, and need no attention for two or three years after the ventilator is installed.

The spherical shaped propeller consists of a number of strips of sheet metal, either galvanized iron or copper, and are securely riveted, bolted, soldered, and wired in place. Copper is used for ventilators where acid fumes and salt air are to pass through. Armco ingot iron will be used on all other models in the future.

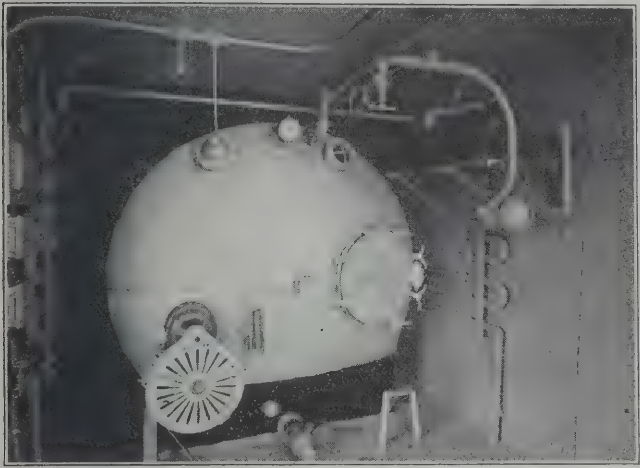
Every ventilator leaving the plant is sprayed with a paint consisting of 50 per cent special acid and salt corrosion resisting paint, and 50 per cent a special paint to resist the elements.

P. F. Kimball is president of the company.

* * *

LINCOLN MOTORS USED ON GLASS-LINED TANK CARS.

The accompanying illustration shows an interior view of one of The General American Tank Car Company's express cars designed for long distance transportation of milk. Two 3,000-gallon tanks are mounted in one car. The illustration shows the end view of one of the tanks.



The tanks are really large milk bottles for, although the tank itself is made of steel, the entire inside surface is coated with glass. On the outside of the steel tank with the glass lining is a layer two inches thick of insulating compound to keep the milk at an even temperature. The tank surface seen in the illustration is a thin sheet metal covering which protects the heat insulation from wear and abrasion. The tank may be illuminated by an electric light which shines through a deadlight and another deadlight is provided, as shown in the illustration, so that the milk may be inspected at any time. The motor shown in the lower left hand section has its shaft connected to an agitator which is used to keep the cream in suspension until the milk reaches its destination. The motor driven blower shown on the shelf in the upper right foreground is used to pump air into the tank after it has been washed to keep it sweet and free from odors. The motors are the product of the Lincoln Electric Co., Cleveland, O.

These modern car tanks transport milk as far as 1,800 miles without deterioration.

* * *

TWO LARGE COLD STORAGE DOOR MANUFACTURERS MERGE.

S. P. Stevenson of the Stevenson Cold Storage Door Company, Chester, Pa., and J. V. Jamison, Jr., president of the Jamison Cold Storage Door Company, Hagerstown, Md., announce the completion of plans for the consolidation of these two companies.

There will be no change in the titles of the two companies, nor in their policies. The full line of products of each company will be made as heretofore, and the manufacturing personnel will remain virtually unchanged. Mr. Jamison will head the merged business concerns. S. P. Stevenson and his brother, Oscar Stevenson, retain a substantial interest and will co-operate in an advisory capacity.

This consolidation brings together the two largest manufacturers of cold storage doors in the world, as well as two of the oldest concerns in the field. The Stevenson Company was started in 1888, being the first known manufacturer specializing in this field. The Jamison Company was started a few years later. From these two organizations have come many products of great value to all type of plants using cold storage, or manufacturing ice, including regular cold storage doors, vertical sliding ice chutes, and the Stevenson door that cannot stand open. With the combined manufacturing facilities, the merged system of distribution and the combined experience of these two cold storage door makers, increased efficiency in serving the trade is a natural sequence.

Improve your milk

. . . at the farm!

Sell farmers and dairymen these two filtering aids. Our advertising will help

MILK should be filtered *before* it reaches the pail—to catch the bacteria-laden dirt particles before the bacteria have a chance to do harm. That is the verdict of authorities.

Farmers and dairymen everywhere are learning this fact from our advertising—learning to stretch a J & J Filter Cloth over the pail at milking time—and to use J & J Cotton Discs in their strainers.

Sell these aids to *your* supply men. Make sure that your milk is of higher quality before it leaves the farm. Often this precaution will make a real difference in the grading of your milk.

We also make Filter Cloths on order to fit the various machines on the market. All three of these products are chemically pure and aseptic. Write direct to us for prices and free samples.

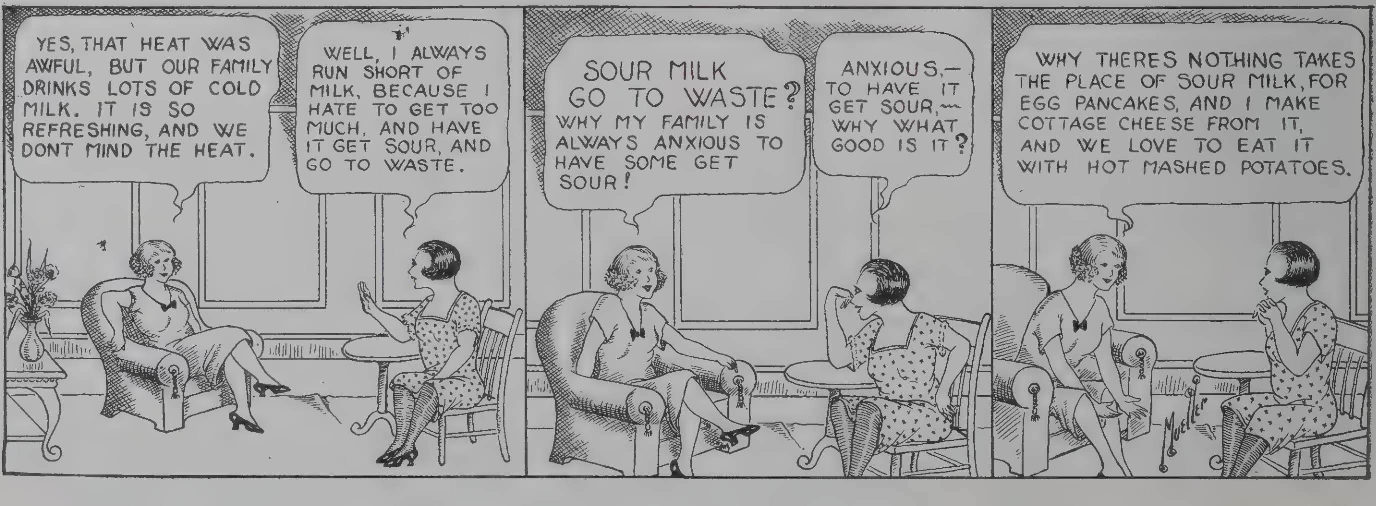
THE MILK MAN

By E. S. Mueller



YES, THAT HEAT WAS AWFUL, BUT OUR FAMILY DRINKS LOTS OF COLD MILK. IT IS SO REFRESHING, AND WE DONT MIND THE HEAT.
WELL, I ALWAYS RUN SHORT OF MILK, BECAUSE I HATE TO GET TOO MUCH, AND HAVE IT GET SOUR, AND GO TO WASTE.
SOUR MILK GO TO WASTE? WHY MY FAMILY IS ALWAYS ANXIOUS TO HAVE SOME GET SOUR!
ANXIOUS,— TO HAVE IT GET SOUR,— WHY WHAT GOOD IS IT?
WHY THERES NOTHING TAKES THE PLACE OF SOUR MILK, FOR EGG PANCAKES, AND I MAKE COTTAGE CHEESE FROM IT, AND WE LOVE TO EAT IT WITH HOT MASHED POTATOES.
MUELLER

Wedding Bells

"Mr. and Mrs. Pierre Felix Mariette announce the marriage of their daughter, Beatrice Dominique, to Arthur Thompson, on Thursday, the eighth of September, one thousand nine hundred and twenty-seven, Beverly Hills, California."

This is the latest news we get from our good friend, "Art," who is an official of the Thompson-Bremer & Company, 1750 Carroll Ave., Chicago, milk bottle cases, ice cream cans, milk cans, etc.

We join his numerous other friends in extending our heartiest congratulations.

⁂

SURPRISE SCORING CONTEST SHOWS IMPROVEMENT IN LOS ANGELES MILK.

The Los Angeles milk supply now maintains the high rating of 95.5 per cent, which is .2 per cent higher than the previous contest, as a result of a surprise milk scoring contest just completed by the representative of the bureau of dairy control.

This high quality of the milk supply is largely due to the high standard of supervision maintained by the city health department, under the direction of Dr. George Parrish, city health officer, and Dr. William Veit, city veterinarian.

That milk drinking is becoming more and more popular is indicated by an increase in daily consumption of more than ten thousand gallons during the last four months. It is evident that the people of Los Angeles have adopted Colonel Lindbergh's famous request, "Give me a bottle of milk!"

Judges officiating in the contest were Dr. M. E. McDonald, assistant chief, bureau of dairy control; Dr. R. P. Gingerich and H. E. Ball, market milk specialists, bureau of dairy control, state department of agriculture.

⁂

NEW FIRM TO PROMOTE MILK STERILIZATION PROCESS.

Killing bacteria in milk and cream by "crushing" them instead of by prolonged heat applications is the theory back of a process which will soon be offered to dairy plant owners. The Wisconsin Steril Milk Co. of Waukesha, Wis., with George Grindrod, formerly with the Carnation Milk Co., as president, is promoting the process.

A new demonstration plant and laboratory has been erected in the outskirts of Waukesha and the process is now in operation.

The claim is advanced that milk and cream can be made absolutely sterile by exposure to steam for one minute at a temperature of 230 degrees F., using only one or two minutes for advancing the temperature to that point. Of course, special equipment is necessary for the process.

Tests that have been made indicate that there is no cooked taste in the sterilized product and that it will keep sweet for many days under ordinary milk handling methods.

This prominent Southern Textile mill used 300,000 feet of MUNDET JOINTITE CORK BOARD. It was placed on the saw tooth roof shown in the foreground. All names on request. Industries are learning that it pays and PAYS BIG to properly insulate the roof.

This is
NOT A CREAMERY

But every creamery owner and official will doubtless be interested to know that textile mills use tremendous quantities of pure baked cork board.

"For ice making?" some have asked.

No. All authorities agree that there is no insulating material equal to pure baked cork for ice tanks, cold storage houses, refrigerators, cold pipe lines, etc. But textile mills use very little cork for such purposes. What they do is this: They INSULATE THEIR ROOFS with cork. There is no insulation for that purpose that is even a close approach to pure baked cork.

As a reader of Butter, Cheese & Egg Journal you probably are more interested in

Mundet Jointite Cork Board
TRADE MARK

for refrigerating purposes. If so, our Practical Refrigerating Engineers, covering the entire United States and Canada, will gladly go into full detail with you and make recommendations.

Finally, Mundet's contract department will install the cork for you. We are equipped to do it RIGHT.

Dairy Council Plans Striking Exhibit

Initial Year for Services of Newly Organized Educational Display Department Enables National Dairy Council to Create Real Interest at Dairy Products Exposition

WHILE the National Dairy Council will be obliged to have many displays this year owing to the different cities where dairymen will meet for conventions and expositions, the displays will be even more attractive and educational than before. For this is the first year that the National Dairy Council has had available the services of its newly organized educational display department.

At the Dairy Products Exposition in Cleveland, the National Dairy Council will co-operate with the Research Council of the Ice Cream Industry in a display showing the possibilities of increasing consumption of ice cream along similar educational lines to those used for milk and butter. Some of the new exhibit materials and literature of the dairy council especially designed for ice cream manufacturers will be on display.

Many Ideas for Milk Dealers.

The dairy council will have a complete display of its new mechanically operated devices, posters, booklets and outlines of methods used in its educational publicity at the annual meeting of the International Association of Milk Dealers at Columbus. Ample opportunity will be given milk dealers who attend the association's meetings to go over this information from which they can get many ideas for increasing consumption of milk in their own territory, as well as securing a better public appreciation for their products. In line with its established policy the National Dairy Council will emphasize its material of interest to dealers distributing pasteurized milk and cream.

The dairy industry will be represented as never before at the annual meeting of the American Public Health Association in Cincinnati October 17-22, where the National Dairy Council has been requested to plan extensive demonstrations of its methods of health education each day of the meeting for the benefit of public health officers, nurses, doctors and welfare leaders. A more extensive account of this unusual opportunity for the dairy industry to place its story before the public will be printed in a later issue of The Milk Dealer.

"Demand for dairy products will forge ahead of production if the dairy industry's present situation is not recognized by farmers as an opportunity for developing a steady cash market for years to come."

This is the message attractively presented in a long series of booths which will feature the National Dairy Council's education display at the National Dairy Exposition at Memphis, October 15-22. The National Dairy Council is a nation-wide educational organization financed by every branch of the dairy industry, to familiarize the public with the high food value and healthful properties of dairy products.

In the past ten years an increase of twenty-seven per cent has been seen in the per person consumption of dairy products in the United States.

While the number of dairy cattle in the nation have constantly decreased, the only reason that the United States still has a sufficient supply of dairy products is because Americans are consuming more fluid milk and butter, and less is being exported. At the same time the average production of dairy cows has shown a steady increase and dairy farmers have found that herds of high producing cows are more economical of labor and feed than the large number of unproductive cows that once supplied the nation with its most nearly perfect food.

The market for the dairy industry is laid out in the exhibit of the National Dairy Council in a striking man-

WANT DEPARTMENT

HELP WANTED

(Rate: 2c per word)

WANTED—Salesman to handle a side line article of merit now on the market and selling to the dairies. A good repeater; will help to increase milk sales. Address: D-323, The Milk Dealer. 9-27tf

WANTED—Salesmen calling on dairies to sell our bottle crate on commission. Liberal proposition. American Box and Crate Co., Louisville, Ky. 9-27tf

HELP WANTED—Man to take charge of operating department of up-to-date milk plant, handling 3,000 gallons of milk daily, pasteurized milk, commercial buttermilk and cream; must be expert on starter and commercial buttermilk making. $50.00 a week to start. Address: Barber Bros. Dairy Co., 28th St. and 7th Ave. N., Birmingham, Ala. 9-27

SALESMAN WANTED—Northern Wisconsin and Upper Michigan peninsula for fibre food container, well established, well advertised, commission. References to accompany application. Address: D-506, The Milk Dealer. 9-27

WANTED—One or two men for half or two-thirds interest in growing milk business bottling over 800 gallons daily. Sales cash or tickets. Capital needed for expansion and someone to handle plant or books and drivers. City of 85,000. Real opportunity for full time, willing workers. Write Paulitch's Dairy, 418 East Duffy St., Savannah, Ga. 10-27

NOTICE—Opportunity for sales superintendent with large concern. State essential facts, results in first letter. Confidential. Address: D-507, The Milk Dealer. 9-27

WANTED—To get in touch with dairyman of ability and financial means to operate high class dairy in this community. Big, unfilled demand here for milk at high prices. Wonderful opportunity for right man. Beautiful, pleasant, all year climate. Tomoka Farms, Inc., Room 2, Woolworth Bldg., Daytona Beach, Fla. 9-27

HELP WANTED—Men desiring connection with a future, possibly interest in dairy business. Must be a route builder himself — a convassing salesman and otherwise capable of taking care of all field work. We have the quality, grade A only, and are now ready to grow. Address Marks' Dairy, Farmingdale, Long Island, New York. 9-27

MISCELLANEOUS.

NOTICE—Clients who have an expansion program, surplus problem, better machinery arrangement, man hour study of operations, design suitable dairy or creamery buildings, machinery required and lay-outs, installations and made to operate. Write us for our proposition. Address: D-407, The Milk Dealer. 9-27

POSITION WANTED

(Rate: 2c per word)

POSITION WANTED—As manager or superintendent of milk plant. Lifetime experience, all lines. Can handle men. Dairy school course, New York testers' and managers' license. Pennsylvania testers' license. Good references. Change of ownership is reason for new connection. Expert on commercial buttermilk, sour cream and cottage cheese. Can come on short notice. Address: D-476, The Milk Dealer. 9-27

NOTICE—Solve your sales problem now. Salesmanager with milk sales promotion experience, American, age 33, married, Masonic, have auto. Prefer yearly contract, salary and commission. Willing to act as route foreman. Prefer South-East, but willing to go anywhere. Can invest. Address: D-501, The Milk Dealer. 9-27

RATES

2c per word for ads placed under headings "Help Wanted" or "Position Wanted."

5c per word for ads placed under all other headings — "Wanted to Buy," "For Sale or Exchange," etc.

In computing amount of remittance, add six (6) extra words if wanted published under Blind Address.

Thoroughly understands the handling of dairy products, both inside and out of plant. Now employed as sales and advertising manager with one of the largest dairy companies in the country; 130 per cent increase retail business last three years. Address: D-487, The Milk Dealer. 9-27

POSITION WANTED—By young man with general experience in plant operation. Three years foreman of mixing room. Technical training. Can furnish references. Married. Address: D-511, The Milk Dealer. 9-27

FOR SALE or EXCHANGE

(Rate: 5c per word)

BUSINESSES

FOR SALE—A completely equipped milk plant bottling 350 gallons of milk in town of 6,000 in middle states. Only plant in town with pasteurized milk ordinance This plant is clearing $600-$700 per month. Good reason for selling. $10,500, with terms to right party. Address: D-402, The Milk Dealer. 9-27

FOR SALE—Retail milk and ice cream business in thriving city of 50,000. For further information address: D-492, The Milk Dealer. 9-27

FOR SALE—Creamery and milk plant established 15 years ago by present owner. In fast growing dairy section, city of 13,000, excellent railroad connections. Present investment in building and equipment, $50,000; in very fine condition. Have made $100,000 during this period besides family expenses. Wish to retire by January 1, 1928, or will keep creamery one year longer and show party our business methods if desired. If interested state amount of capital you will be able to invest. Address: D-496, The Milk Dealer. 9-27

MACHINERY AND SUPPLIES.

FOR SALE—One new $640 Cresco 200-gal. pasteurizer with motor direct connected. Sacrifice price, $490.

One new $75 Milwaukee bottle drainer. Sacrifice price, $55.

One new $325 Alvey bottle case elevator. Sacrifice price, $275.

One rebuilt C-P 150-gal. coil pasteurizer. Sacrifice price, $225.

One No. 12 $110 De Laval separator; universal drive, used only about 6 months. Sacrifice price, $67.50. Address: D-270, The Milk Dealer. 9-27tf

FOR SALE—One Ladd blue line big six bottle washer, capacity six crates per minute; machine guaranteed good as new; price including motor less than one-half of original cost. Address: The Union Engineering Company, Cuyahoga and West 4th St., Cleveland, O. 9-27

FOR SALE—Two spray vats, capacity 300 gals. These vats have been used four months, will sell for $400 each; 3 starter cans, 75 and 100 gals.; 2,500-lb. cooler. This equipment is in good condition. Union Dairy Company, Freeport, Ill. 11-27

FOR SALE—One 12-h.p. upright boiler; one 18-h.p. upright boiler; one 3-brush R. G. Wright bottle washer and sterilizer; one R. G. Wright bottle filler. Above machinery is as good as new. For prices write Olbrych's Dairy, Amsterdam, N. Y. 11-27

FOR SALE—Completely equipped dairy in Eastern Pennsylvania handling over 3,000 quarts milk daily, yielding yearly profit of not less than $12,000. Address: D-480, The Milk Dealer. 9-27

NOTICE—The entire equipment of the bankrupt estate of The Jefferson Dairy Company, handling 6,000 gallons of milk daily, is offered for sale at bankrupt prices. All equipment is in good condition. One 8,000-lb. per hour Burrell holder with heating and cooling units, milk pumps, steam pumps, receiving vats, cooling vats, Milwaukee bottle fillers, churn and full line of dairy equipment. Also 35 ball-bearing milk wagons at very low prices. If you need this equipment write Barber Bros. Dairy Co., 28th St. and 7th Ave. N., Birmingham, Ala. 9-27

(Want Department continued on next page)

FOR SALE—Three steam driven Sharpless clarifiers, cost new $1,500, at $200.00 each F. O. B. Chicago. Used three months. Acme Oil Corp., 189 No. Clark St., Chicago, Ill. 9-27

FOR SALE — Refrigeration Machines — Used—We have several used and new machines of nationally known make, which we can sell at a big saving to you. Will erect and guarantee the plants fully. Address: Erecting Engineers Company, 4725 West Lake St., Chicago, Ill. 9-27tf

FOR SALE—Here is an opportunity. New Davis rotary filler, Junior size, Model 640, motor driven, cost $700. A reasonable offer takes it. Also nearly new De Laval separator, capacity 2,500 lbs. per hour, direct motor drive, for $125. Cost $185. We also have several tubular milk coolers, large and small sizes. Address Merkle Dairy Company, 2727 N. Halsted St., Chicago, Ill. 9-27tf

FOR SALE—One Yundt air brush bottle washer, capacity 120 bottles per minute. complete with motor driven air compressor, 3 phase, 60 cycle, 220 volt motors and conveyors. Used about 2 years. In good mechanical condition. Original cost installed $15,000. Will sell for $7,000, f. o. b. St. Louis. Write to the Meyer-Blanke Company, St. Louis, Mo. 9-27

FOR SALE—Kunsman Milk Advertising Talks, Series No. 2. A year's campaign—57 ready written ads—only $5.00. Money back if not satisfied. Kunsman Ad. Service, 29 Reed St., Reading, Pa. 10-27

A motor truck, milk wagon—in fact, anything of interest to milk dealers, can be disposed of through "The Milk Dealer" Want Department.

FOR SALE—Rebuilt and guaranteed dairy equipment at worth while savings. Write for price list. Lincoln Equipment Company, 2611 Stevens Ave., Minneapolis, Minn. 9-27tf

FOR SALE—Cherry ripener-pasteurizer, 800 gal. capacity, belt drive, splendid condition. Kendall two-section milk cooler, 1½ in. enclosed tubular type, used two weeks, brand new. These two machines are for sale at a price which will move them at once. Clintonville Milk Co., Clintonville, Wis. 10-27

FOR SALE—Account insufficient capital opportunity now to buy milk plant. Sales about $150,000 per annum. Don't delay. Address: D-508, The Milk Dealer. 9-27

WANTED TO BUY

(Rate: 5c per word)

WANTED—Used pasteurizing vats, coolers, ice breakers, ice cream cans and tubs, churns, etc. Send us list of what you have for sale. B. Riley Hauk & Son Company, 201 S. First St., St. Louis, Mo. 9-27tf

WANTED TO BUY—Several second-handed, heavy, single milk wagons. Address: D-478, The Milk Dealer. 9-27

WANTED—Used 7-ft. condensing pan and vacuum pump. The Polk Sanitary Milk Co., 1100-1112 E. Fifteenth St., Indianapolis, Ind. 9-27

WANTED—To buy or lease with option of buying a good paying retail milk plant. Must be in a good business town. Address: D-439, The Milk Dealer. 9-27

WANTED—Small vacuum condensing pan outfit complete. State full particulars and minimum price in first letter. Address: D-489, The Milk Dealer. 9-27

A motor truck, milk wagon, in fact, anything of interest to milk dealers, can be disposed of through The Milk Dealer "Want Department."

WANTED TO BUY—In eastern Pennsylvania, well established dairy business that is operating on profitable basis. Address: D-479, The Milk Dealer. 9-27

WANTED—50 or 100-gal. cheese vat. Address: Paul Chanter, 321 Griswold St., Jackson, Mich. 9-27

WANTED—A large wholesale wagon in good condition. Address: Paul Chanter, 321 Griswold St., Jackson, Mich. 9-27

ner. As the thousands of people enter the exposition building they will be confronted with a beautiful blue and white polar scene, where fur clad sailors are maneuvering a ship through glaciers and icebergs of the North. The ship is in motion and in the background is a play of northern lights making a setting for the story of how attractive and necessary a food ice cream has come to be in the American diet.

Typifying the nation-wide educational program of the dairy industry is a large exhibit showing a group of school children listening to their teacher outlining the desirable habits which they must assume to be healthy and happy. Here the youngsters learn that dairy products are but one of the necessary adjuncts to a vigorous healthy life. The largest part of the National Dairy Council's educational work is conducted among school children through a series of health education projects, with suitable literature, which school teachers and school nurses are using in nearly every city in the United States.

The necessity of a clean milk supply to assure the dairy industry of a satisfied consuming public is emphasized in another section of the National Dairy Council display. Here the best types of feed, clean milking methods and utensils, proper cooling and pasteurization of the milk before bottling and other methods of maintaining a high quality milk supply are shown.

Uses of dairy products in the home, factory, office, bakery and school are picturesquely displayed in still another part of the extensive National Dairy Council's exhibit. How the housewife gets a uniformly high quality butter is shown in one booth, where a mechanically operated dairy cow is chewing away at her feed while milk is passing through the snow-white creamery where men in white jackets churn the golden product of Mother Nature into a highly nutritious and essential food for the maintenance of the health of the nation.

A large health food show is one of the principal attractions of the National Dairy Council's display, and will in itself be well worth seeing. Here attractive girls, representing the nation-wide 4H Boys' and Girls' Club movement, will demonstrate the proper balancing of meals and other health requirements of the typical American family. Boys and girls, and their mothers, will be given a rare treat each day of the National Dairy Show when these health food demonstrations are opened for their inspection free of charge.

Motion pictures will be a daily free feature of this educational display in co-operation with the United States Department of Agriculture, and thousands will be thus given an unusual and interesting "movie" show. They will, at the same time, learn of the dairy industry's methods of educating the public to an increased appreciation of dairy products and the opportunity for the agricultural sections of the South to develop a new source of steady income.

FREDERICK E. SEILER, FORMER BEST KNOWN NEWARK, N. J., MILKMAN, DIES.

Frederick E. Seiler, 72 years of age, formerly one of the best known milkmen in Newark, N. J., died at his home in that city on July 6.

Fifty-five years ago Mr. Seiler started a milk route in Montclair on which he served 14 customers. A decade ago, Mr. Seiler gave up the presidency of Seiler Brothers, Inc., then one of the largest wholesale milk and cream firms in northern New Jersey, to form the Newark branch of Harrington & Co. of Philadelphia, Pa., whose distribution of dairy products is national in scope.

REPORT ON PROPOSED SUPERVISION OF MILK SUPPLIES IN HAVANA.

A report on the proposed supervision of milk supplies in Havana has been prepared by Trade Commissioner Merwin L. Bohan and submitted to the foodstuffs division, department of commerce. This report covers divisions of the city, methods of gathering and testing samples, regulations for distributing milk, etc. A copy of this report will be furnished upon request by the foodstuffs division.

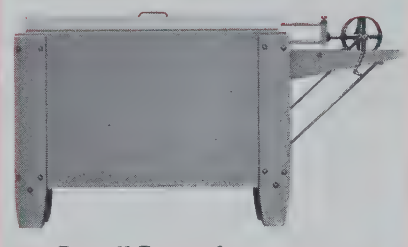
Yesterday and Today in Pasteurization

and the part CP has played



Russell Pasteurizer

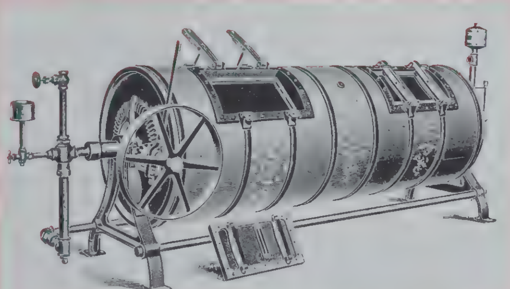
As a pioneer pasteurizer builder, The Creamery Package Mfg. Company believes it opportune to review briefly some historical facts.

Louis Pasteur, for whom the process is named, was born December 27, 1822 and died September 28, 1895. While he did not work with milk, he laid the foundation upon which the whole structure of modern milk pasteurization is built.

Our first pasteurizer was the Russell, so named because it was built according to designs approved by Dr. H. L. Russell, then Bacteriologist, now Dean, of the Wisconsin College of Agriculture. It was built before 1895 by Cornish, Curtis and Greene at Fort Atkinson, Wisconsin in what is now our Fort Atkinson works. The cut herewith is from a photograph of machine used at University Creamery, Madison, Wisconsin, for several years prior to 1898.

Milk was pasteurized in a relatively long, deep and narrow vat surrounded by a water jacket. A flat blade agitator moved back and forth in the milk. Another traveling agitator operated in the water space to facilitate exchange of temperature. Heating, holding and cooling, all were accomplished within the machine. Two features worth mention were, the overlapping cover which prevented entrance of dust and moisture, and, the round bore outlet cock located within the water space and operated by handle from above. The apparatus was crude but bacteriologically sound and would pass muster today.

The next machine made and sponsored by the Company was the Potts. The milk was treated within a cylindrical vessel entirely surrounded by water. Revolving the drum agitated both milk and medium and it heated and cooled quite rapidly. The outlet was through a gate valve outside the machine with a nipple connection to the interior. At each revolution of the drum the nipple was emptied of milk at the top and refilled as it again reached the milk level—not a flush valve, but no cold dead ends, either.



Potts Pasteurizer

The Potts came into general use. It was scientifically right and would meet today's requirements. It gave way to the demand for more speed and capacity to handle larger volumes of milk.

Thus briefly is outlined the beginning of our experience in pasteurization. In the intervening quarter century we have built machines of various types to meet the changing demand for speed, capacity, economy and quality of product. Every demand of the industry, every requirement of the health authorities has found us prepared to meet it.

and now?

At the coming Dairy Industries Exposition, we will exhibit some new equipment which we believe will convince you of our ability to continue to meet the demands.

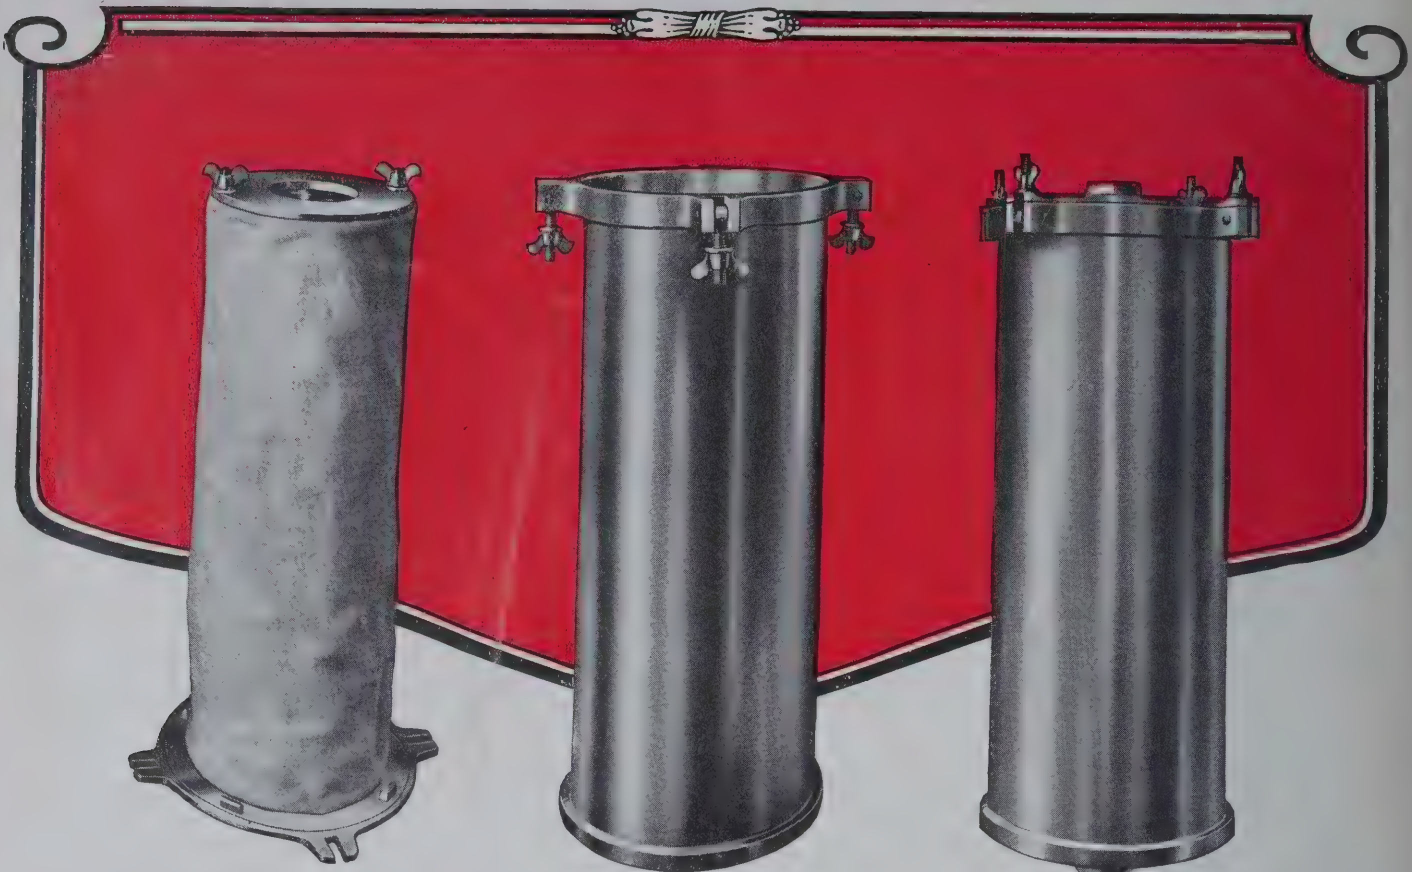
"FOR BETTER MILK HANDLING"



Cloth placed over frame ready to be set into shell

Outside shell—empty

The YORK Filter completely assembled

Illustrations show No. 1 YORK Filter, capacity up to 6,000 lbs. per hr.

A New Milk Filter

in which the cloth is placed in position before being assembled

THE YORK Milk Filter is the very latest type of improved filtering device. Since the cloth is placed in position before being assembled, you are able to see that it fits properly and that no milk is passing through unfiltered.

There are no wires or screens to clog or catch the dirt. Simplicity of design makes it extremely simple to operate. The cloth is the only part which must be replaced. The filter can be taken completely apart and cleaned thoroughly. The ease with which this can be done causes little wear and therefore long life.

The YORK Milk Filter is made of 2-ply tinned heavy copper sheet and brass castings heavily tinned all over. Like all other YORK products, it is produced—
